The conclusion of argument in such cases must therefore be, that in the construction of building, it is right, wise, and best that every dollar paid by owners should pass into the hands of parties residing and doing business in, and having abiding interest in the welfare and prosperity of, this city and State. This proposition is sustained by every right, consistent, and self-preservative view of the case; and every contract let direct or through agencies, to parties or firms in other States, for materials or things manufactured that might be obtained in San Francisco, is, so far as its influence extends, a public injury.

Hard Wood Lumber.

THE progress of hard wood lumber manufacture has been steadily westward. New York and Pennsylvania were once the principal hard wood producing States. Then Ohio was invaded and largely stripped of its available timber. The Indiana forests have been exploited and nearly exhausted, and coming square up against the great savannas of the Mississippi Valley, which extend, practically unbroken, to the Rocky Mountains, the westward movement was checked. The stream was divided, one part turning to the north, into Michigan and Wisconsin, while the other and larger part has trended toward the southwest, extending into Kentucky, Tennessee, Mississippi, southern Missouri, Arkansas, and Indian Territory. These two divisions of the hard wood industry are for a long time to come to be competitors in the markets of the north, though the southern belt has some most valuable woods which the northern has not.—*The Wood-Worker.*

Masinissa, who died 148 B. C., deservedly occupies a conspicuous place in Roman history. Although a barbarian, he was free from the crime so common among uncivilized tribes. Fearless in war, generous in disposition, a good statesman, and firm in loyalty to his Roman allies during an unusually long life, Masinissa may fairly be considered the hero of Numidia. Like all his race, he drank nothing but water, and, at the age of ninety, was able to jump on his horse bare-backed. He left forty-four children.

Architectural Organizations.

WITHIN the past few years the interest in architectural associations in all the more rapidly improving sections of the country has greatly increased, and in the parts where architects are most active in this direction, there seems to be more life and progressive activities. The influence of such organizations is to drive out the narrower conceits of the mind and to develop more enlarged and broader views as to personal relationship and professional courtesies and practices.

That "there is nothing new under the sun" may be a verified trueism in a general sense, as to principles and material things, but no one mind is so full of absolute knowledge as to be justified in claiming universal information upon all subjects, nor perfect understanding of all details of but few, if any. Hence, all unities and co-operations designed and calculated to harmonize views and sentiments, correct errors, and lead to right conclusions, must be fruitful in good results.

The age is one of progression. The bound from the common conditions of forty years ago to those of the present day is grand and wonderful to contemplate. And in this mighty advance and overturning the science of architecture has shared a part and made its record, whether for the better or worse would require hundreds of pages to discuss in full. But this is certain, that those who permit themselves to drift and strand upon the barren rocks and ledges of absolutely selfish purposes and individualism, must expect to perish in their self-imposed and dreary isolation.

Skipper—Contractors, and Other Things.

ALL sections of the country seem to be more or less cursed with that class of unprincipled creatures known as "skippers," *i. e.*, fellows who enter into contract obligations at any price, high, low, good or bad, as the case may be, so that they can secure to themselves the opportunity to handle and pocket coin, paying it out only as far and fast as may be necessary to mature other payments in greater amount than the aggregate of the sums paid out, until the chances to make other "hauls" are exhausted; then comes the *finale*,—the boss gone to parts unknown—skipped, leaving everybody to do the best thing possible under the circumstances. If a few of such rascals could be caught and strung up by the neck as an example, the morals of the contracting business would certainly be improved, and the world not be the least set back by the sudden disappearance of a score or two of such men.

There is a case related where one of the kind in New York contracted the erection of a lot of buildings, hiring and working a large force of journeymen, who, at the end of two weeks, were creditors for wages in the sum of nearly $2,000, but the should-be payor, the contractor, was nowhere to be found—had "skipped"—and, when the owners were interviewed by the workmen, they were informed that all moneys due had been collected by the absent one. The matter being referred to the Carpenter's Union, and a transfer of the indebtedness made to a delegate, a lien suit will be commenced to test the validity and soundness of the protective law, and trade interests generally will watch the result anxiously.

The Trade Unions in the Eastern cities are very diligent and exacting as to the strict observance of the rules adopted. The combination appears to be solid, and will likely so remain, so long as fairly brisk times continue; the only likely decline will result, if at all, under a general let down in activities, so as to bring about that wretched condition of things which has in former years spread want and privation among the laboring classes, and, in isolated cases, actual starvation. It is well and proper that men should combine for the purpose of determining and protecting mutual business rights and interests, but it is wise to temper prosperity with a great deal of good judgment and deliberation. Much more is permanently affected by a wise, moderate, yet solid and defensible course. When advantages are rendered tyrannical and oppressive, they invoke and excite prejudices and opposition, and when the occasion presents itself, retaliation ensues. That which is most to be desired is a right understanding between labor and capital—a harmonizing of the two material factors, so that each will feel its proper dependence upon the other, and neither seek to oppress.

"None Such"

Is the significant name of a ventilator and chimney top advertised by Kneass & Co., 29 Taylor Street, and which is very highly recommended, as, "No trouble to get up a good fire;" "Does all that is claimed for it;" "A thorough ventilator," etc.

It is so constructed by flanges and openings that the slightest currents of air from without and from any point, up or down, cause a vacuum and an upward and outward current of heated or foul air from within, doing all that any apparatus placed in open air for a ventilator can do, and more, because direct currents of air pass through it in greater volume than any other yet invented; therefore it is more powerful in operation, and is so constructed that the current of air from without passes through it and off in such a way that it is impossible to have a back draft.

It has no movable parts and cannot get out of order; no squeaking of rusty machinery; it is worth its cost simply to keep out the dampness when used as a chimney top.

The largest body of fresh water on the globe is Lake Superior, 400 miles long, 160 miles wide at its greatest breadth, and having an area of 32,000 square miles. Its mean depth is 900 feet, and its greatest depth is said to be about 200 fathoms. Its surface is about 635 feet above the level of the sea.

San Francisco's Sewerage.

THE universal and continuous outcry that the sewerage of this city is bad, is fully justified by the facts of the case. In some respects they are about, if not absolutely, the very worst to be found in any city upon earth's surface, with anything like equal, natural drainage advantages. Nature, or the power that caused the hills to raise their tops high above, the lower lands, left in the main but very few acres of level ground within the city's site the altitudes of the *many* hills varying from more than three hundred feet down to the bay-washed shores. In three directions,—north south, and east,—the water-sheds and courses were originally exceedingly fine, and if even *fairly* clever civil engineering had been practiced in the establishment of street grades, and consequently the grades of sewers, our present dilemma would have been avoided. It is only fair, however, to remark here that the "established grades" are those foisted upon the city by a modifying board of civil engineers, who, for reasons, set aside the "original surveys" as made by Mr. Milo Hoadley, which utilized and equalized the cuts and fills, to produce that splendid system of inclines and grades which, if they had been carried into effect, would have made San Francisco's sewerage unsurpassed by any other city in the world.

The difficulties surrounding the case are irremedial, except the partial reliefs obtained by flushing and cleaning, which, unless constantly employed, afford but temporary and momentary remedy, unless, further, the wiser and *only entirely correct and effective course*, advocated by this Journal years ago, is adopted and carried out, *i. e.*, to MAKE *the grades of the sewers such as will meet the requirements and necessities of the case*. There is a natural law or principle involved in this matter, which is absolutely arbitrary, and will not change to accommodate human views. It is all supreme nonsense and folly to say or think that sewers will run free, and clear themselves, when the lower portions *lie at dead level* for a distance of from 1,000 to 2,000 feet, particularly with the discharge or outlet end submerged below the surface of the waters of the bay, into which they empty, as is the case in this city. The debris from the higher parts is washed down to the level sections, where the more solid matter lodges and remains, settling and forming a dam, the lighter substances passing off in solution; and it needs only the exercise of the most ordinary intelligence to understand that, under such conditions, choked sewers are inevitable.

Had the suggestions made in this Journal five years ago been carried into practical effect, to wit: Take the grade of Dupont Street at California, with its eighty-six feet elevation, or modify that by raising Kearny Street ten feet, or even adopting the altitude of Kearny at California Street, thirty-five feet, as the high point of grade toward the sewer outlets, and following the same regulation correspondingly around the other portions of the city, filling in and making a uniform slope in all directions; while the expense would have been very large, the benefits would likewise have been immense; and the cost much less then than it would be to-day; and it will cost less if done *now* than at any future time, as every new building erected adds to the difficulties. The answer to this may be, It is a preposterous, monstrous proposition. The reply is, Be it so; it is nevertheless the only effectual means of remedying the most fearful, local, permanent evil and curse existing in San Francisco, and such it will continue to be until the heavy cost method of correcting the evil is adopted. Artificial means have been, and will continue to be, applied, but the ever-recurring results will be the same, no clean and clear sewers enjoyed, until the natural laws of gravitation are observed.

Master Painters' Association.

THE regular monthly meeting of the Association was held at its hall, 121 Eddy Street, on Tuesday evening, 1st inst., President Gallagher in the chair; Thos. Noble, Secretary.

Resolutions of condolence to the family of the late member, David Kanary, were adopted and ordered spread upon the minutes.

Report of committee on cards with sign signet, for the special use of the members, was adopted.

A communication from a member, J. F. Sullivan, containing resolutions and offer of co-operation by the master painters, with architects, owners and contractors, to check and prevent the numerous innovations upon the use of pure paint materials and good workmanship, was read and adopted. A committee of four, consisting of Messrs. Sullivan and Donovan, of San Francisco, and Messrs. Kress and Weiswell, of Alameda County, was appointed to confer with architects upon the subject matter of the communication.

A vote of thanks was tendered the editor and proprietor of the CALIFORNIA ARCHITECT AND BUILDING NEWS for favorable notice of the proceedings and purposes of the Association.

The resolutions offered by Mr. Sullivan, and adopted, read:—

To all parties interested in the building interests in the city and county of San Francisco,—architects, owners and contractors:

WHEREAS, The Master Painters' Association of the Pacific Coast being informed and knowing that adulterated paint materials, containing none of the elements of pure lead and oil paint, are manipulated and passed off as genuine in quality, and inferior workmanship imposed upon architects, owners and contractors by parties assuming to be practical painters, and

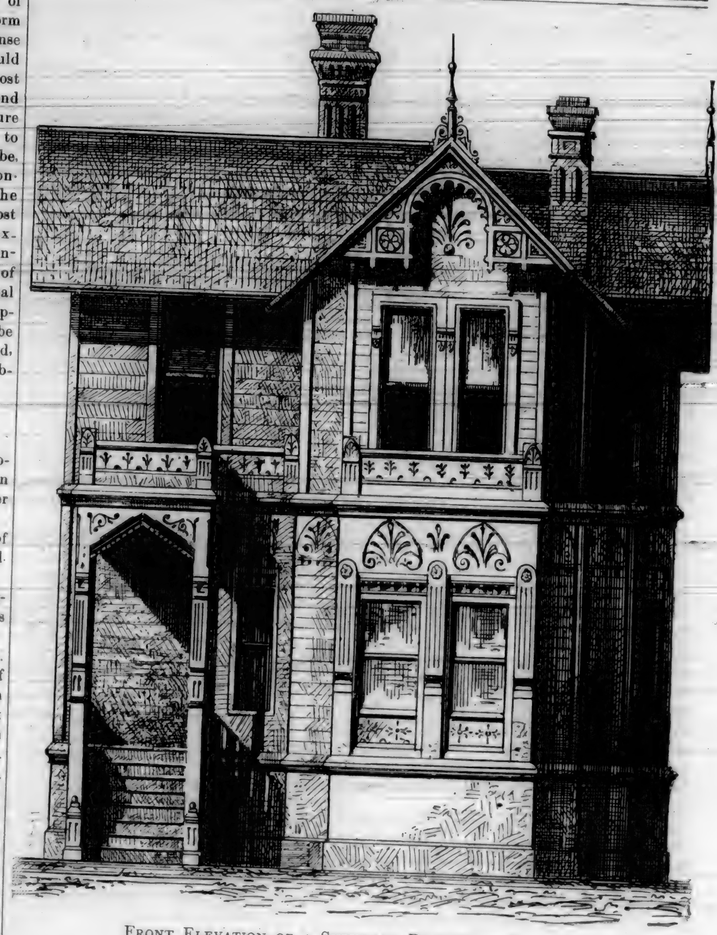
WHEREAS, It is the purpose and desire of the responsible portion of the craft, under the title of the "Master Painters' Association," to expose and prevent, as far as possible, a continuance and repetition of such wrong and demoralizing practices, therefore, be it

Resolved, That said Master Painters' Association tender its services, as an organization, to owners, architects, and contractors, by competent expert representatives, duly appointed, to detect and expose all such improper practices in the future.

To accomplish this desired purpose, said Association requests that all owners, architects, and contractors who may become satisfied that wrongs are being practiced in the painting work of any building or works, to report the case to the Executive Committee of the Association at its rooms, 121 Eddy Street, second floor, whereupon said Executive Committee will forthwith designate two competent members of the Association to investigate the facts of the case, and report to the Executive Committee the result of their investigations, whereupon said Executive Committee will report the facts to the owner, architect, or contractor in interest.

Resolved, That it is not proposed to assume any dictation or control, or in the least interfere with the architects' duties, but simply to ascertain the true state of the case connected with the painting work, and report accordingly.

Resolved, That neither owner, architect or contractor be charged for such expert services.



FRONT ELEVATION OF A SUBURBAN DWELLING.—PLATE I.

A NEW BUILDING MATERIAL.—A mixture of cork, silica and lime is coming into extensive use in Germany. It has the advantage of keeping out heat and cold, and is also claimed to be an excellent preventive of damp and defender of sound. It is substantial, light and durable, and seems to be especially adapted for ceiling and wall lining.

Kansas lands, in the last ten years, have yielded products valued at the enormous aggregate of $1,046,262,264. Yet it is one of the youngest of the States. In 1883 the corn crop was nearly double that of any other State. It stands fifth in the amount of wheat grown.

Architectural Competitions in Disfavor.

THE general expression of architects in all parts of the country, as received through all journals published in the interest of architectural sciences, is very decidedly against the practice of plain competition. By all the better class of educated architects, it is regarded as demoralizing and unprofessional in character; a bartering away of professional skill at values fixed by men who seek to obtain a large amount of architectural work and service for an exceedingly small amount of money.

A most glaring wrong and injustice is shown by the fact that, in no case of competition, are the services and labors one-tenth part compensated, as a whole, induced by the invitations, sometimes studiously seductive, very generally thoroughly deceptive, in that representations are made, calculated upon fair interpretation of the language used, to impress the minds of men not posted in such matters, with the belief that a square deal is proposed; while in fact the arrangements and understandings are all well matured, if not absolutely completed with some preferred architect.

We will not go so far as to assert and charge that where committees are appointed by respectable bodies for the purpose of procuring plans, or boards of trustees, that *all* the members in either case are alike guilty and responsible for the numerous *bad things done;* but there is always one or more of the influential members who have friends to serve, or who, for other considerations, become very active, and manipulate influences by which they virtually control the whole matter, so that any or all parties not in such special influential favor, only waste time and skill, and secure to themselves disappointed hopes and expectations.

In other cases, the competition propositions are based upon fixed purposes and intent to beat some one; to find some fool willing to belittle professional compensation to the rates of wages paid ordinary journeymen, house carpenters or brick masons. But such plan hunters sometimes pick up a boomerang, in the shape of badly damaged property, by bad planning and worse construction. And this fact is very certain, that, to include all plans made in competition during the past ten years, placing values thereon according to schedule rates, then add up all the monies paid as premiums, and all the *regular* fees received by architects, and divide the amount pro ratio among the plan-makers, and the result would not reach more than *one-tenth of one per cent* on the original estimated costs. If this is not demoralization, then that commodity is difficult of access.

The *Building Trade Journal* remarks on this subject: "This practice has been more fruitful than any or all others put together, in disappointments and loss to owners, by placing the erection of important work in the hands of inexperienced draughtsmen, or reckless, wire-pulling practitioners. It has resulted in a vast amount of bad building all over the country. Said a witty journalist: 'I always wonder, when a new Court House is finished, that the people of the county do not hang the architect the first thing.'"

The president of a corporation employed a competition architect to design a building that cost $100,000 more than the estimate (that is one of the tricks), which resulted in a large crop of litigation wherein the owner explicitly testified in court to numberless defects in plans, and finally remarked to one of the profession, "I do not think much of you architects any way." (Of course he judged all by the scrub type he had employed.) The apt reply was: "No wonder, considering the kind you patronize."

"But in regard to the general practice of architectural competitions, the impression is strangely prevalent that it cannot be overthrown, that it has always existed and always will; that it is the blood, so to speak, and cannot be cast out. Never was there a more unfounded delusion among a body of liberally educated men. So far from being a practice which has always existed, it is, with rare exceptions, an innovation of quite recent date. All the traditions of the profession, all its records of great achievement, are almost uniformly against it. Which of the notable buildings of the Middle Ages, the world-famed cathedrals, abbeys, castles, mansions, from the thirteenth century down to our own day, were designed in competition? How many of the great works of Michael Angelo, Bramante, Sansovino, Bernini, Scamozzi, the San Gallos, Palladio, Schenkel, Klenze, Labrouste, Duc, Duban, Sir Christopher Wren, Sir William Chambers, or any other of the great names of architectural history were obtained in a competition scramble? If these matchless monuments could be designed with a perfection and grace the world will never cease to admire, how can American architects maintain that a County Court House, or a club-house, or even an exposition building, cannot be properly planned without competition? The example of Brunelleschi with the Duomo of Florence, is often quoted in favor of competition, but this was an exceptional instance, and only proves the rule against the habit. If Brunelleschi was a competition architect, why was this the only instance of the kind in his work? Moreover, what achievements has the practice of competition to cite which will at all compare with these great works which have been designed without it? What record, indeed, of any kind can be shown for competitions except of great expectations and signal disappointments, of buildings which are architectural abortions, of intrigues, corruptions, scandals, and litigation?"

"The craze for competition is not an ancient and venerable custom which cannot be disturbed. In England it dates chiefly from the building of the new Houses of Parliament; in France, from the year 1860. All the great advances of the profession were made before it arose to disturb their peace—since then it has wrought only mischief."

"Nor is it true that competition is 'in the blood,' nor that it is a feature of modern civilization, nor that, because it is 'the life of trade,' it is anything but ruinous to a profession. Competition is essentially unprofessional, and is endured at all only among architects. It is not found among lawyers, doctors, artists, civil engineers, nor in any of the other professions."

Many of the leading authorities among architects have already expressed their unequivocal condemnation of architectural competitions *in toto*. At the Convention of the American Institute of Architects in New York, in 1867, President Upjohn, one of the oldest and most eminent architects in this country, thus warned the profession against them:—

"I feel as if I should not fully discharge my duty to my younger professional brethren, if, after my extensive opportunities, and long experience, I should omit all allusion to a subject, the effects of which have, according to my observation, produced much evil, and only evil, to the profession. I allude to competition — general competition — a sorry subject for architects. It burns the fingers of all those who meddle with it; it is a chronic infatuation, an *ignis fatuus*, a Will-o'-the-Wisp. . . . Now, my good friends, this species of infatuation (I can call it by no better name) should be shunned. I pray you to let general competition alone. Avoid it as an unclean thing, which can produce only heart-burning and disappointment; and, by abstaining, you will give it its death-blow."

Vice-President Hatfield and others have said: "Competition is a barrier to progress, second only to professional exclusiveness."

"Can that which engenders jealousy, false representations, misunderstandings, bitterness, dishonest propositions, and evil wishes be promotive of good, either to architects or architecture?"

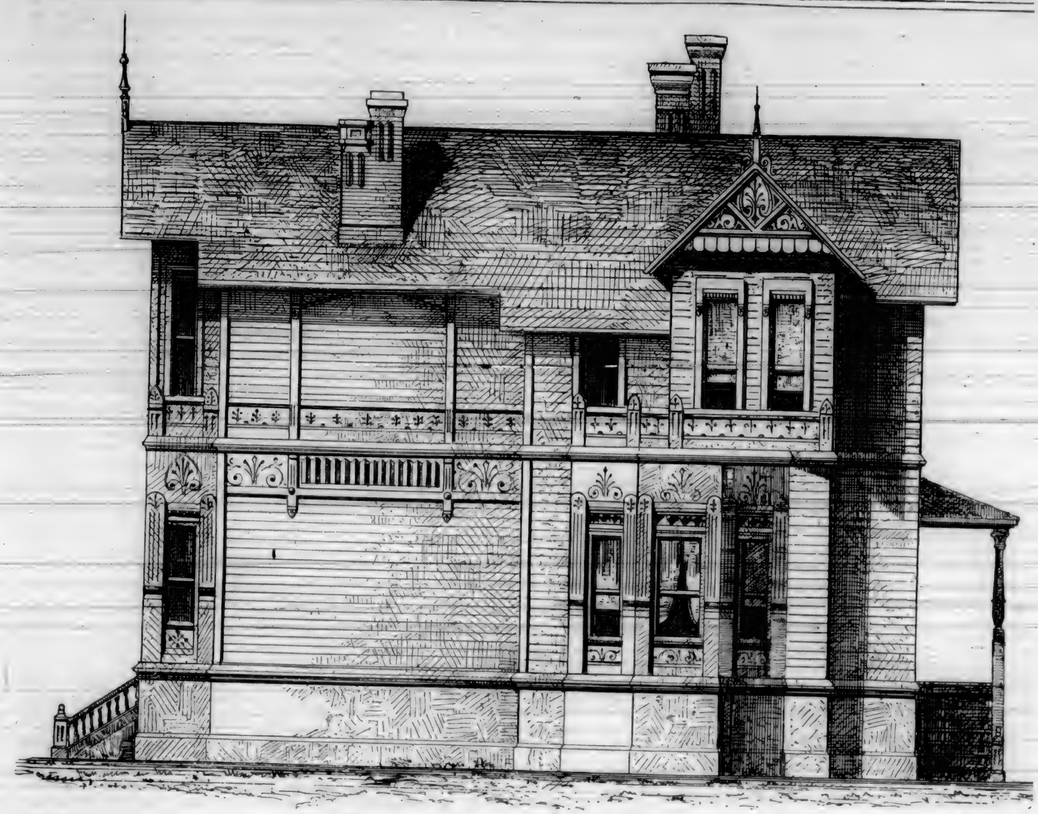
"By competition as now managed, we see that an unscrupulous competitor endeavors to rise by treading upon his fellow competitors."

"Those who allow themselves to be ensnared into its toils, soon lose their self-respect."

"Theoretically, competition is a fair method of estimating reputation, but practically it has been in nearly every case a failure."

The Toledo Court House, to cost $500,000, was wisely given to a local architect without competition.

CRUSHING RESISTANCE OF BRICK.—Walls laid up of good, hard-burned bricks, in mortar composed of good lime and sharp sand, will resist a pressure of 1,500 pounds per square inch, or 216,000 pounds per square foot, at which figures it would require 1,600 feet high of 12-inch wall to crush the bottom courses, allowing 135 pounds as the weight of each cubic foot. Walls laid up in same quality of brick and mortar, with one-third Portland cement added, will resist 2,500 pounds per square inch, or 360,000 pounds per square foot, which would require a height of wall 2,700 feet to crush the bottom bricks.



SIDE ELEVATION OF A SUBURBAN DWELLING.—PLATE 2.

German and American Tools in the British Colonies.

A CORRESPONDENT writing from Auckland, New Zealand, to the Sheffield *Independent*, records the surprise he felt at finding American and German cutlery and hardware so generally adopted throughout the colony. He says that saws of all kinds, axes, carpenters' claw hammers, bench axes, adzes, garden tools, hay and manure forks, braces, etc., of American manufacture, are preferred to Sheffield goods. The American file manufacturers are coming to the front apace, and unless the Sheffield makers put better steel into their mill saws and saw files, they will soon lose this trade. The imports of German and American cutlery, too, are largely on the increase. A much better price can be got for American articles than for Sheffield goods. A workman will give 7s. 9d. for an American hand saw rather than 5s. for an English one; 3s. 6d. to 4s. for a claw hammer rather than 1s. 6d. for English; 8s. for an American ax rather than 6s. for English. There is not much difference in quality between English and American manufacturers; if there is any it is in favor of England, but in style and finish there is no comparison, the American being far ahead. Workmen say the Sheffield tools are so heavy and unmanageable that they soon get tired in using them, while American implements are so designed that a greater amount of work can be got through with much less fatigue. Another great factor in introducing American goods is the handy manner in which they are packed, card board or light wooden boxes being used, which are much more convenient than paper parcels. A storekeeper can show an American article in a moment, but an English one has to be denuded of two or three wrappers before it can be shown, and to save time and trouble the American article is first shown.—*American Inventor*.

DECORATED CEILINGS.—Interior decorations are being much more generally adopted. Plain white walls, without any reliefs, used to satisfy, but the improved tastes of the age call for a departure, and nothing adds more to general effect than a neatly, if not richly decorated ceiling.

Our Illustrations.

WE present in this issue the elevations (plates 1 and 2) and plans (plates 3 and 4) of a medium-sized suburban dwelling. From the main hall on the first floor a direct entrance is afforded to the parlor, dining-room, and kitchen. An easy flight of stairs leads to the second floor, where the chambers, bath-room, and water-closet are situated, the latter being conveniently located off the hall. Plate 5 shows another arrangement of the first floor whereby one more room may be added if desired. The elevations are at once neat and attractive without being very expensive.

A lady on Marlboro Street who had summoned a plumber to remove a defunct rat from the wall, recently received a bill in which one item read: "To hunting up a smell and repairing it, $4.00."

A Muskegon firm proposes to cut 115,000,000 shingles this season—more than any mill in the county has ever cut heretofore.

One Chinaman—Three Whites.

THIS is an approximately fair and safe proposition, in this way: each Chinaman engaged in manufacturing operations, whether as employer or employed, occupies the place of a white worker or manufacturer, and each white worker, as a rule, and as an average, represents not less than three in family, consequently every *ten* thousand Mongolians employed excludes *thirty* thousand of the white race thus inflicting privation and wrong upon the number so excluded, and imposing upon the communities or places wherein such exclusion exists, all the loss of acceptable population and trade transactions that result in such cases.

. . . . .

The Chinaman buys nothing from white sources that can be avoided; sells all that he can to white consumers; lives upon the products of China land, or those produced by China tillage and serving upon our own soil; saves all the money possible from his resources, and sends or takes his accumulations of coin to the flowery land of his birth, leaving, as the true record of his sojourn upon American soil, the fact that he added nothing to the wealth or morals of the country, but skinned out and carried away all that was possible to him.

. . . . .

The white man, on the other hand, if prudent, careful, and successful, saves his earnings, and invests them in a home, or, perchance, in other houses and lands, and so adds to the general prosperities. Or, should he not be of the thrifty kind, securing a home or other prosperities, still he spends and circulates his earnings, thereby adding greater prosperity to general business, and wealth to the scenes of his labors. Hence it may with propriety be said that one Chinaman equals three whites, based upon present existencies, and, if viewed in the light of posterity, the comparison is increased beyond calculation, for, in the one case, there is a continual waste and injury, while, in the other, a perpetual growth and benefit ensuing down through generations. From this standpoint of facts, which cannot be assailed or controverted, it is proper to say that Chinamen, as a rule, are human leeches upon the interests of any country or community, outside of their own, tolerating them, ever extracting, and drawing from, and inflicting moral and commercial injury. Every act, thought, impulse, and feeling of their natures are supremely selfish—personally and nationally.

The Dome of St. Paul's, London, is 370 feet high, and its weight 17 tons per square foot of base.

The Dome of St. Peter's, Rome, is 430 feet altitude, and 14.7 tons pressure per square foot of base.

The Merchant's Shot Tower, Baltimore, Maryland, built of brick, is 246 feet high, and pressure at base, 61½ tons per square foot.

Science of Architecture.

[Special for this Journal. By F. Hillert, Architect and Mechanical Engineer.]

(Continued.)

A SPECIAL attention is required for an arrangement to dampen or moisten the entering air. The reproach made against the air heating, that the air is "dried out," is perfectly unfounded. By the heating of the air, the same becomes relatively drier, but it is immaterial if the same is heated in a room to 20° by a separate oven, or by any other means; the effect will be the same. That air heating acts more as a drier than any other system is mainly due to the high ventilation connected with air heating, and therefore is an artificial dampening with this, as with any other system required, when a powerful ventilating arrangement is connected with

HOT WATER HEATING.

According to the temperature to which the water, by special arrangement of the system can be heated, there is, accordingly (1) low pressure or water heating, warming the water to 100°; (2) high pressure or hot water heating, warming the water up to 200°; (3) middle pressure heating, warming the water up to 120°.

I. LOW PRESSURE OR WATER HEATING.

The main component parts of the water-heating system are: The apparatus for heating the water (heating boiler), which is placed in the lowest part of the building, and is of a suitable construction to economize the fuel; the lowest position is selected to obtain a quicker circulation of the water, the equilibrium of the same being disturbed by the different temperature, causing a circulation of the water columns in the distribution and return pipes; to the heating boiler are attached the conducting pipes, connected with the heating body (heaters) placed in the rooms to be heated, and the return conducting pipe fastened to the heater, taking the water therefrom down to the heating oven, completing the circulation (by the different temperature) of the water; and, lastly, the expansion vessel and the air-conducting pipes.

In regard to the horizontal expansion of the system, the heating boiler should, if possible, be placed in the middle of the arrangement, when, by it, the capacity of expansion of the system in horizontal direction is conditioned. Under a medium proportion (for not too high or too low a column of water), the maximum of horizontal extension of the system can be taken about 200 meters.

The calculations for the warm-water heating boiler are not only made for the consideration of the needed transmission heat for the rooms to be warmed, but also in regard to the time required in which, from the commencement of the daily firing up, the heating of the higher rooms is accomplished. This time depends, besides on the transmission to the rooms, on the amount of the water contained in the system. The same is, for the decision on the size of the boiler, on the highest measured, by three hours. The quantity or the amount of water in the whole heating system is measured by the kind of building, on the uniformity of the heat to be distributed in the rooms, requiring a large reserve of heat or heat-supplying capacity of the system; consequently, the more water boiler and heaters must contain.

We can assume that 1 square meter direct heating surface can extract 10,000 units of heat hourly from the fire gases, to be transferred to the water for heating purposes. In shape the boilers can vary; the best are the smoke or tubular boilers, but the latter only when the flame strikes square on the tubes, and is not conducted parallel to the same.

The disposition to be made for the conducting of pipes can be arranged in a double manner, namely, the warm water can be conducted direct up to the highest point, and thence in a horizontal direction for distribution to the different separate places needed; the string of pipes, therefore, should not be above 60 to 80 meters long, measured from the boiler; or the horizontal disposition can be made below the lower floor, and thence the warm water in ascending is conducted to the places for use. The last arrangement deserves a preference for small extensions, but it cannot always, for want of space in the building to be executed.

The horizontal pipes are run covered, and are protected from cooling off by being served with non-conducting material; the vertical pipes can run in recesses, etc., of the walls and be secreted; to keep tight joints, the same must be screw joints. The conduit of the pipes starts at the highest point of the boiler, must ascend continuously to the highest point of the arrangement, respectively, of the heaters, and from them descend continuously, to enter the lowest point of the boiler.

The bore of the pipes is determined in a practical manner, by taking for each square meter heating surface for the ascend and descend pipes an average section of 0.7 to 0.89 square meter (0.10 to 0.11 square inch), and for the main ascend and descend—back conduit—pipes 0.6 to 0.7 of the whole surface of the heating body.

The air accumulated in the system escapes to the highest point, and is collected and conducted to the expansion vessel and discharged by air cocks, etc. The material applied for the conducting pipes is copper or iron; the latter is recommendable for many instances; wrought iron is preferable to cast iron; lead should never be used, nor leaded joints be made. For pipes of small diameter screw joints are to be recommended; for larger pipes, joints made with flanges, with a rubber ring inserted between them.

The heating bodies have the purpose to abstract the heat required from the water to warm the room, by being transmitted to the surrounding air. For the calculation of the size of the heating bodies, the following formulas can be applied; they have been given before, but for convenience and comment are repeated :—

$$M = 124.72\ Ka^t\ (v^{T-tA} - 1) + 0.552K_1\ (T - t)^{1.233}$$

M is the emitted heat per hour per square meter surface; K, a coefficient depending on the condition of the surface of the heating body, and has for common use the following values:—

Polished brass,	0.258	Polished black sheet iron,	0.450
Copper,	0.160	Roasted sheet iron,	3.36
Zinc,	0.240	New raw iron,	3.17
Tin,	0.215	Roasted "	3.36
Common iron,	2. 77		

K is a coefficient depending on the form and extension of the surface, and has the value for a spherical surface of radius r.

$$K_1 = 1{,}778 + \frac{0.13}{r}$$

For a horizontal circular cylinder of radius r.

$$K = 2{,}058 + \frac{0.0382}{r}$$

For a vertical circular cylinder of the radius r and the height h

$$K_1 = \left(0.726 + \frac{0.0345}{\sqrt{r}}\right)\left(2.43 + \frac{0.8758}{\sqrt{h}}\right)$$

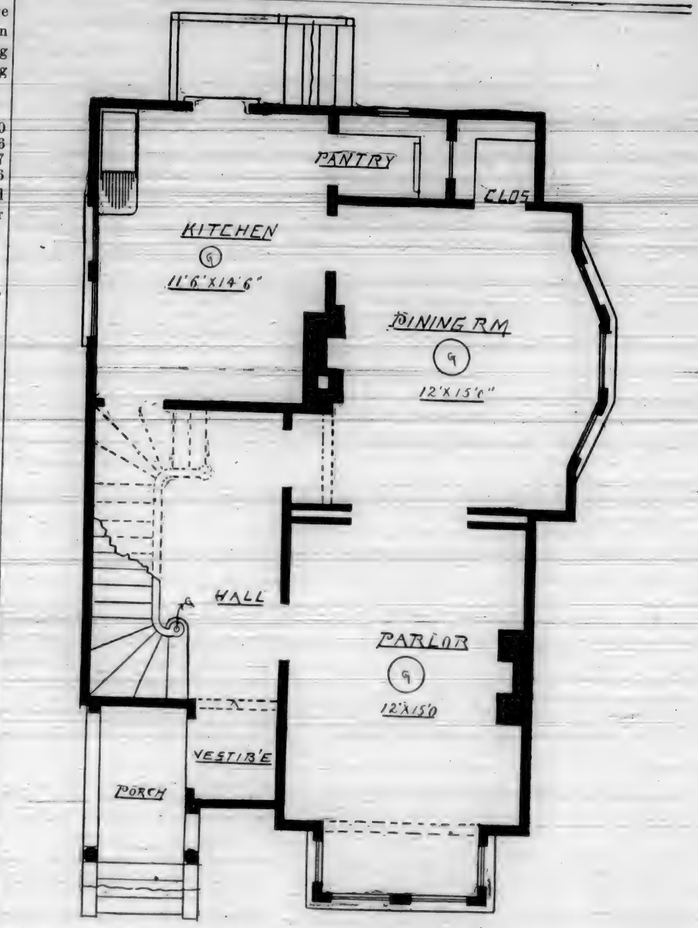
T is the temperature of the heat-delivering surface; t, the temperature of the heat-absorbing air; a, a constant = 1.0077.

From the above formulas we learn that the form and extension of the heating body, and the condition of the surface of the same, bears a large influence on the emission of heat. It is necessary for the execution of an arrangement to decide approximately, according to the form and condition of the heater, the different temperature the water obtains in the different stories of the building, for the emission of heat in heater, and afterwards to calculate the proportionate sized corrector. For the first approximate projection and estimate of cost we can take, that the heating body, for an equal-sized and equi-distanced heat-accumulating and heat-distributing surface, is capable to give over, on the average, for 1 square meter per hour 300 units of heat to the atmospheric air of the room.

In form heaters are different; a full, round water body, upright or horizontal pipes, put together and to be an ornament to the room they are placed in.

The disposition and placing of the heater in the room is rather free; large heaters are placed in the corners, smaller ones—register—in niches, under window sills. Care must be taken that the radiating heat emitted is made useful, and that by closing up with screens, etc., the air circulation is not impeded.

In connection with the heater a stop-cock must be put in, to stop the circulation as a whole or in part, by which a regulation of the temperature can be effected. The flue boilers and the conducting pipes should be constructed so strong as to stand a test, before setting the arrangement in use, of five atmospheric pressure. The expansion vessel serves to take the increase of volume of water by expansion, which is 0.003 of its volume for 1° C. The vessel must have a space not only to take this increase in volume, but, besides, for a constant quantity of water of 100 mms. (4″) high above the bottom (for the settlement of any sediment) and a volume of 100 to 200 minims



FIRST FLOOR PLAN SUBURBAN DWELLING.—PLATE 3.

(4″ to 8″) high as a surplus of height, serving against over-boiling caused by the rising steam bubbles.

Self-evidently the expansion vessel has an overflow and discharge to regulate the state of water to the height desired. The expansion vessel fulfills, besides the purpose of discharging the air and steam from the arrangement, the control of the height of water in the system. The same is located above the highest point of the string of pipes, and is connected with it by a branch pipe. It is not closed, and can therefore keep the water in the heating boiler by that much over 100° heated, equivalent to the pressure of this column of water resting in the boiler; and this is the characteristic sign of the low pressure heating system.

II. HIGH PRESSURE OR HOT WATER HEATING.

The important component parts of the arrangement are: (*a*) the heating oven or the fire coil; (*b*) the conduit of pipes; (*c*) the expansion apparatus.

(*a*) The fire coil consists of a coil of pipe of 34 mms. (1 5-16″) outside, and 23 mms. (⅞ in.) inside diameter (tested for 250 atmospheric pressure). The construction of the fire-oven and the form of the fire coil are very variable. The main consideration is, that the best abstraction of the heat from the fuel is obtained, which, besides other things, conditions that the heating oven must be a countercurrent apparatus. The length of pipe for the fire coil is decided by the quantity of heat required for the rooms to be heated. For calculation it can be taken that one running meter (3.18 ft.) of pipe of the above make can take up easily 500 units of heat, to be delivered to the water in the coil. In this approximate, the losses of

heat, the beginning and high heating are included.

Many fire coils can be interwoven one between the other, to be cleaned from a common hearth, and be connected in such a way that the water in the first coil, after passing the rooms to be heated, can enter the second coil from below, then the third, etc., and, after passing the rooms from the last coil, can enter the first coil below, to repeat the circulation of the water over again.

The fire coil, with its conduits of pipes, is called a system; the whole length of the same should not exceed 180 meters (575 feet); the shorter the better.

The conducting pipe is of the same caliber as the fire coil, starts at the upper end of the latter, passes through the rooms to be heated, and connects again, on its backward conduit, with the lower end of the fire coil.

For the circulation of the water in the pipe it is of advantage to conduct the hot water in the same to the highest point of the arrangement, and only on the return to the boiler is it passed into the heating coil of the heater placed in the rooms for the abstraction of the heat. The heating coil can be placed in a convenient position in the room, or in channels covered with grating.

Since a hot water heating apparatus consists only in an uninterrupted line of pipes, the heated water in the circulating coil must pass all the rooms. By the insertion of a threeway cock the water in the run can be connected with the heating coil, or the same may be closed and the water turned into the cock-run. The disconnection of one room increases the heating capacity of the others.

The heat emission capacity of the pipes is calculated by the formula for water heating; approximately, can be taken on an average that in a system the emission of heat per one meter of pipe is 95 to 100 units, the room having a temperature of 20°. The distribution of pipes must be done, not according to the mean value, but according to the value of emission for one unit of length for the whole length of pipe, where the whole length of the system, height of air circulation, horizontal extension, the turns and bends of the conduit, are to be considered.

The tightening of joints is executed by making universal joints with right and left threads; no tightening it off by other means must be used.

Before putting the arrangement to use, the system must be tested under a pressure of 150 atmospheres.

The filling up of the system with water is done from the lowest point, which must be done carefully, and all air expelled from the cistern before being heated, avoiding explosion of the fire coil.

As much as 200 tons of terra-cotta have been used in the Potter Building, New York. The building is 165 feet high and has eleven stories and two stories below the surface. The fronts of the first and second stories are of cast iron.

Fall of a Solid Stone Staircase.

A VERY unusual building accident happened in an interior town of France, some months ago, which illustrates anew the importance of employing competent and careful architects in the erection of public buildings, and of the exercise of constant care in constructions which are commonly supposed to be especially substantial. In the eulogies so often met with, of the superiority of European buildings to those of this country in regard to solidity of construction, we are frequently told of the stairways, which are built of solid stone, and which are at once assumed to be absolutely secure from danger. Yet it was precisely such a stair of solid stone steps, built into the solid walls of the Court House, in the small city of Thiers, France, which gave way suddenly when filled with people, and caused the shocking death of twenty-four victims, and the maiming and wounding of one hundred and fifty more. The particulars are briefly these: The stairs were very wide, and each step, consisting of a single stone, was imbedded in the wall of the building at its outer end, while the other end, by a sort of dovetail construction well understood by stone masons, rested upon the step below without other support. There was a light iron balustrade to guard this side of the stairs. An interesting trial was in progress in the court room on the second floor, and early in the morning a large crowd had gathered in the building awaiting the opening of the upper doors. Of these, it is estimated that as many as five hundred had gathered on the stone stairway. There being some delay in the resumption of the proceedings, the crowd on the stairway began to manifest its impatience by stamping. Suddenly there was a crashing sound under their feet and the whole stair gave way and sank into the pit below, with all the crowd of men, women, and children who were on it and under it. It is seldom that a more distressingly painful accident occurs, even in this land of reckless building. While few people realize the fact, it is nevertheless true that the lives of a community are almost, or quite, as completely in the care of the architects they employ, as of their physicians—with this very serious difference, that, while a doctor's mistake seldom costs more than one life at a time, a single slip of an incompetent or cheap architect may result in the slaughter of hundreds of innocent victims. There is one other difference, that, while most intelligent people are prudently shy of cheap doctors, many of them think that when an architect is wanted, any Bohemian who can make an excuse for a plan, and who will work for a day laborer's pay is good enough for them.—*The Building Trade Journal.*

The latest door-knob device we have noticed is one operated by pressing on a button in the center of the knob, similar to the ordinary electric button, but the knob itself remains stationary.

Ancient Cisterns and Cements.

SOME few miles west of Bougie are the scattered remains of the ancient Tubusuptus, the modern Tiklat. The side is strewn with Roman stone. The walls of the great cisterns are still standing, consisting of 15 galleries, each being 116 feet by 13 feet 9 inches, and about 20 feet deep. The dividing walls are 2 feet 9 inches thick, built of rubble, but carefully constructed. These great reservoirs are a peculiar feature in North Africa, being found, some in fairly perfect condition, on the outskirts, or frequently within the walls of nearly every town. Those at Carthage, for instance, known as the smaller cisterns, to distinguish them from the larger series, which may be assigned to Punic times, are even now in good preservation, although built with small and irregular-shaped stone. The hardness of the mortar here, as elsewhere, is very noticeable; and the cement lining, known as *opus signinum* extremely thin, and made of crockery shards, is of so hard a texture as to be broken with great difficulty. The secret of mortar composition appears to have passed from the Romans to the Arabs, who still employ the same ingredients in the construction of arches, terraces, and cisterns. The composition appears to be one part sand, two parts wood ashes, and three of lime. After being thoroughly incorporated, the mixture is beaten for three days and nights with wooden mallets, sprinkling a little water, and at times adding a small quantity of oil, till the whole becomes of due consistency. In the jointings of pipes, also, the Arabs follow the method of the Romans, beating together two, and lime with oil, and without water. The composition speedily assumes the hardness of stone and is impervious to water.

Owing to the shutting down of Western nail mills, pending the settlement of the wages question, nails have become scarce, and the price has advanced. Eastern nail mills are taking advantage of the situation to do a rushing business. One mill recently had to decline an order for 50,000 kegs.—*American Machinist.*

A building was in process of erection opposite a public building in Washington City. One of the clerks who had been looking out of the window for some time, said to another clerk who was reading a newspaper:—

"I have been watching that workman over there for half an hour, and he has not done a lick of work in all that time. I wonder what he gets paid for?"

Just about the same time the workman remarked to a fellow workman:—

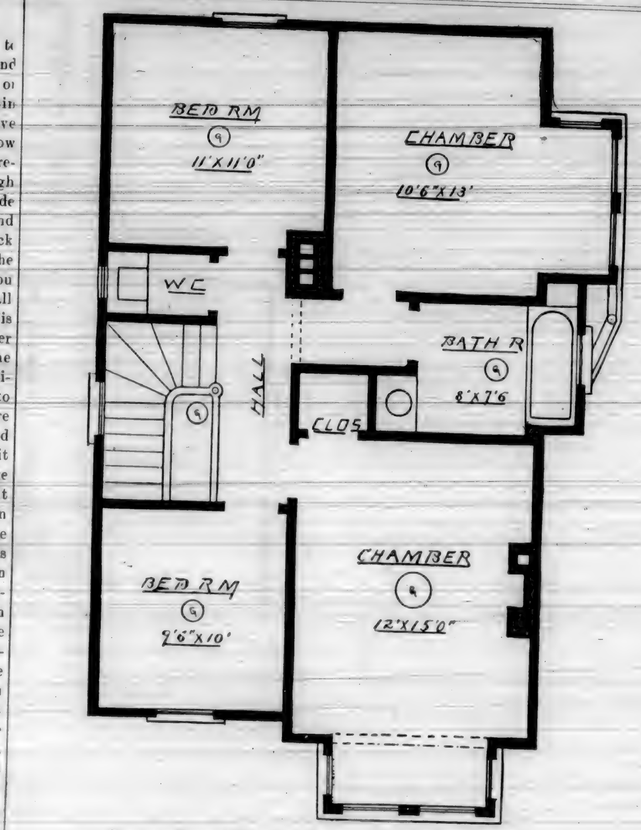
"Just look at that government clerk over there. He hasn't done anything except look out of the window for the last half-hour. No wonder the country is going to the dogs."—*The Wood-Worker.*

To darken light mahogany and cherry, bichromate of potash dissolved in water is excellent, and gives it the appearance of age.

Porcelain Portrait Oil Painting.

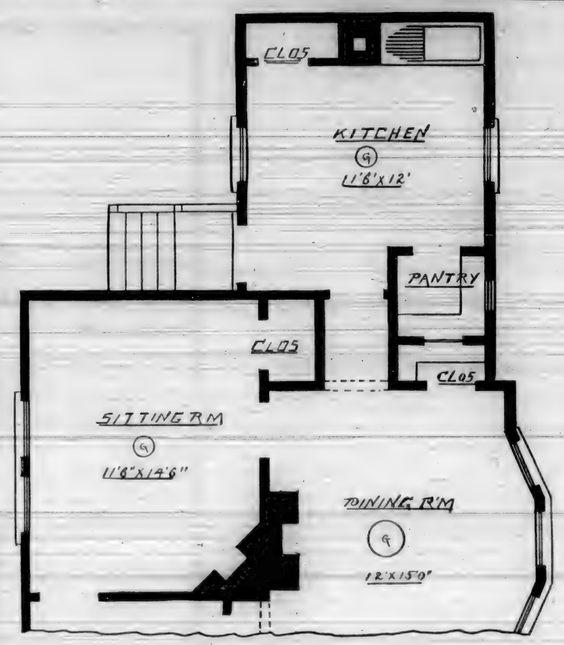
FIRST, procure the portrait that you wish to paint (a bust cabinet picture of the head and shoulders is the best), and lay it in a dish, or pan of soft water, and let it soak until the thin paper that the photo is taken on will remove easily from the card on which it is pasted. Now procure a piece of glass the size of the paper removed and with flour paste (strained through a cloth) paste it on the glass, the print side down; now hold the glass in one hand and with the fingers of the other rub on the back of the print, commencing at the head of the portrait and rub around and around until you reach the edge of the glass, rubbing out all blisters and surplus paste. When the paste is thoroughly dry, take a piece of fine sandpaper or emerypaper and sandpaper as much of the paper from the back of the print as you possibly can, without cutting through the print to the glass on which it is pasted. Now procure a little Cosmoline from your druggist, and rub this over the back of the print and hold it over a stove and warm it in, until you make the photo transparent so that you can see it as well from the back of the glass as you can from the front. Now it is ready to commence painting: procure two or three small camel's hair brushes with hair about one-eighth of an inch long and about as large around as a knitting needle. First mix a little white lead with boiled oil, two parts, and Japan dryer, one part (use oil and dryer to mix all of your colors with), with your small brush and a little of the white paint just make a little dot on the small white spot that is found in the sight of the eye of the photo (this is called the high light); mix a little black and paint the sight of the eye around the little white spot that you have made; if the eyes are blue black, brown, or gray, mix a little paint as near the color of the eye as possible and paint the rim or circle that surrounds the sight of the eye with it; now mix a little vermilion red and white together and paint the lips. If there is any jewelry represented in the photo, paint it yellow. Now procure another piece of glass the same size as the one you have and clean it off well; now cut four pieces of blotting paper each one-eighth of an inch wide and two inches long, paste one of these on each edge of the glass, the same side that your photo is pasted on; paste the top of these papers and lay on your other glass so that the edges are even; cut four strips of writing paper about three-fourths of an inch wide and two inches long, paste one of these and stick it to the upper glass allowing about one-third of its width to lap on the glass, press it closely over the ends of the glass and lap the remainder on the under glass; paste one on each end of the glasses. This will bind the two glasses together. Royal Glue for sticking and binding the glasses together is recommended. Now with a little white paint paint on the back of the (in painting hold the glass toward the light) last glass the white of the eyes; mix a little burnt Sienna and Naples yellow and white together, making a flesh color, paint all the flesh that is shown in the photo. With a little vermilion red paint the cheeks right on top of the flesh color just put on and rub this with your brush until it shows to suit your taste from the front of the glasses. Now mix up colors to match the hair or beard and clothing, and paint them. Paint the background any color to suit your taste. When done, if the colors do not suit, you can rub them off with a rag, and mix and try again. When completed place in a velvet frame and you will have one of the nicest oil paintings you ever saw.

A singular building operation is now in progress in Boston, where the old Masonic Temple, recently occupied by the United States Court, is in process of being replaced by a modern dry goods store. The structure stands at the corner of two of the principal streets, one of which, after the usual Boston fashion, had been widened through its whole length, except at the corner in question, where, either on account of the ownership of the land by the United States, or by reason of the cost of altering the old building, the city authorities had been unable or unwilling to change the original line. As the building thus projected three or four feet into the street, constituting a disagreeable obstruction, the new owners, who bought the property from the United States, reflected that if they were themselves to demolish the old Temple, which was perfectly useless to them, the city government, seeing the land cleared, would probably seize the opportunity, while there was no building on it, to condemn enough of it to complete the widening of the street. Although they would, of course, be compensated for the land taken, the reduction in the size of the intended store would be a serious detriment to their business, while the very widening of the street would deprive them of the benefit of that advertising which a store prominent enough to block the way in a crowded thoroughfare always gets; and they resolved to manage their building operations in such a way that there should be constantly on the



SECOND FLOOR PLAN OF A SUBURBAN DWELLING.—PLATE 4.

land a structure so large and costly that the city authorities would hesitate before incurring the expense of demolishing it. With this idea the work was begun by piercing the walls of the old Temple near the ground, and inserting needles, with shores outside and inside sufficient to take the whole weight of the superstructure; and removing the foundations, to replace them by the foundations for the new building. As these approached the sidewalk level, it became necessary to commence the second and more hazardous portion of the undertaking, which consisted in raising the Temple about fifteen feet, so as to allow the work of the new building to be carried on under it. Boston is somewhat noted for the skill of its building-movers, and although the old Temple was by no means a credit, in point of construction, to the masons who built it, having walls of rather incoherent rubble, faced with the "saw-tooth work" which pleased the unscientific fancy of our grandfathers, the contractor in this case contrived, by putting timbers across the windows, and tying them together, to convert the shell of the building into a reasonably rigid box, under which were placed 300 jack-screws, resting on the piles of timbers, which by this time had replaced the shores. The work of lifting was then intrusted to six men, whose duty it was to go steadily around the building, giving each screw, as they reached it, a quarter-turn. When the screws had been turned to their full length, about fourteen inches, more timbers were inserted, and the screws were reset for another lift. So far, the work has gone on with perfect success, and by the time the old Temple has ceased to be of service in protecting its owners against the economical city authorities, the new building will be far enough advanced to take its place.—*American Architect and Building News.*



ADDITIONAL PLAN, FOR FIRST STORY, SUBURBAN DWELLING.—PLATE 5.

Book Learning.

PROFESSOR HUXLEY says: "I do not say that knowledge is not an extremely good thing; but if a man is to make a good workman, or to do anything in practical life, you must give him an education that fits him for the conditions of life with which he has to deal, and you will give him an education by filling his head with a number of intellectual abstractions, or even by giving him the largest acquaintance with scientific principles. And I think it is a profound mistake, considering the career to which the majority of artisans or persons in that class of life are necessarily bound, ever to take them out of the wholesome discipline of practical contact with the realities of life, for the mere sake of giving to them a greater or less amount of knowledge. A man who is inclined to do so may always pick up knowledge, and he may do so at the same time that he is getting his education, in the highest sense of the word, out of his contact with the realities of his daily life; but if you make a book-worm of him, if you take him away from all that contact with reality and turn him back afterwards into it, he has lost touch of life. I have had to do with mankind in many stations in life, and it seems to me that what is wanted in a foreman is a man of energy, punctuality, business habits, and power of dealing with men, all of which things are not to be got out of books or laboratory work. These qualifications are the most essential qualifications in a foreman, and what you want besides in such a man is not book learning, but an intelligence sufficiently trained to be able to deal with new conditions, and an amount of knowledge sufficient to enable him to know where to go and find more if he wants it."

Facts Worth Knowing.

A CUBIT is 2 feet.
A pace is 3 feet.
A fathom is 6 feet.
A span is 10⅞ inches.
A palm is three inches.
A great cubit is 11 feet.
A league is 3 miles.
There are 2,750 languages.
Oats, 35 pounds per bushel.
Bran, 35 pounds per bushel.
Barley, 48 pounds per bushel.
A day's journey is 33⅓ miles.
Two persons die every second.
Sound moves 743 miles per hour.
A square mile contains 640 acres.
A storm blows 36 miles per hour.
Coarse salt, 85 pounds per bushel.
A tub of butter weighs 84 pounds.
Buckwheat, 52 pounds per bushel.
The average human life is 31 years.
A barrel of rice weighs 600 pounds.
An acre contains 4,840 square yards.
A firkin of butter weighs 56 pounds.
A barrel of flour weighs 196 pounds.
A barrel of pork weighs 200 pounds.
Slow rivers flow five miles an hour.
Timothy seed, 45 pounds per bushel.
A hurricane moves 80 miles per hour.
A rifle ball moves 1,000 miles per hour.
Rapid rivers flow seven miles per hour.
A hand (horse measure) is four inches.
Electricity moves 288,000 miles per hour.
The first lucifer match was made in 1829.
Gold was discovered in California in 1848.
The first horse railroad was built in 1826–27.
A mile is 5,280 feet, or 1,760 yards in length.
Corn, rye, and flaxseed, 56 pounds per bushel.
The first steamboat plied the Hudson in 1807.
A moderate wind blows 7 miles an hour.
Wheat, beans, and clover seed, 60 pounds per bushel.
The first use of a locomotive in this country was in 1829.
The first almanac was printed by George Von Purbach, in 1640.
The first steam engine on this continent was brought from England in 1753.—*American Inventor.*

The Boston Society of Architects have held council in the matter of more nearly equalizing the rates of profe-sional compensation, by increasing charges on all work costing less than $10,000. The proposition is a fair and just one, as the expense of preparing plans, specifications, and details for buildings of moderate cost very nearly equals those costing more than the sum named; and the work of superintending is but little greater in the more costly than in the cheaper class buildings. Certainly the expense to an architect in preparing plans, specifications, and details for three separate and distinct buildings, costing an aggregate of $20,000, is very much greater than those for a single building costing the same sum, and the value of time consumed in superintending the three, is infinitely more than for the single building. Consequently at five per cent in both cases, the compensation in that of the three would fall, comparatively, far below that of the single building. And five per cent being no more than should be paid by owners in any case, the regular fee of five per cent would be a hardship upon the architect.

The responsibilities and duties of architects are greatly undervalued, and the importance to owners of securing the services of a competent, experienced, and qualified man, overlooked. The miserable idea of economizing in the matter of architectural services, is a mistake that has caused thousands of owners to regret their folly. And it is a firmly established fact that the practical damages sustained by owners, to more or less valuable property through this sort of false economy, amounts to millions of dollars each decade of time. The shortages in rentals, loss of time in renting, the inferiority of the class of renters, and the diminished selling value of the property, on account of wretched planning and bad construction, in buildings planned by and erected under the superintendence of second to tenth rate architectural pretenders, in thousands of cases, amount yearly to several times more than would have paid the full schedule rates to competent architects. The owner who, for one moment, permits the consideration of economy to intervene in the selection of an architect, does a very unwise thing.

POLISH FOR MARBLE.—One-half ounce of magnesia; two ounces oxalic acid; one pint of warm rain-water. Use a white woolen cloth.

METHOD OF DEADENING SOUNDS IN BUILDINGS.—General M. C. Meigs, writes to the *Sanitary Engineer* as follows in reference to an article on deadening the sounds from water-closets, which appeared in a late issue: "I have found it impossible to make myself heard by a person on the other side of a large window, double glazed, interval between panes seven-eighths of an inch. Glass is very elastic, and should, I suppose, therefore, be a good sound-conductor. But the voice cannot be heard through two sheets of ordinary French window-glass separated by seven-eighths of an inch of air. In this, I think, may be found a hint for shutting off sound."

LEAD POISONING FROM A PAINTED WATER TANK.—Dr. Bartley, chemist to the Brooklyn Board of Health, reports an interesting case of lead poisoning which was caused by using water from a tank on shipboard, which had been painted nine months before with red lead.

The case was that of a Norwegian vessel which reached the port of New York with all the officers and crew more or less seriously ill from lead poisoning. They were removed to the Long Island College Hospital, where one of them subsequently was seized with convulsions and died. The curious element in this case is the fact that the water tank, which had been painted while the vessel was at Copenhagen, should have been used without any evil consequences during several voyages, having been several times filled at certain ports at which the vessel stopped. It was only after having the tank refilled at Cadiz, and after having proceeded on her voyage for some time, that the symptoms of sickness began to manifest themselves, when one after another of the crew sickened, until all were affected, with the result previously mentioned. Meantime the vessel had touched at several South American ports, where the tank had been again refilled several times. No less than nine months, as above mentioned, had elapsed between the time of painting the tank and the first outbreak of the malady, the tank in the interval having been in constant use.

To account for this anomalous circumstance, Dr. Bartley supposes that the first few times the tank was filled, it was with hard water—containing carbonates—the result being the formation of an insoluble film of carbonate on the surface, which protected the lead beneath from solution and the water from contamination. Later a softer water was probably used—containing nitrates and nitrites—which are known to have a marked influence on the corrosion of lead pipes, and which would act in a similar manner upon the lead paint.

The circumstance is instructive, as exhibiting very strikingly the danger of using lead paints for such a purpose as that herein described.—*Manufacturer and Builder.*

OLDEST HABITATIONS IN AMERICA.—Major Powell, Chief of the Geological Survey, who has been about a month in the field, has discovered in New Mexico, near California Mountain, what he pronounces to be the oldest human habitation upon the American continent. The mountains in this vicinity are covered with huge beds of lava, in which the prehistoric man and his comrades excavated square rooms, which were lined with a species of plaster made from the lava, and in these rooms were found various evidence of quite an advanced civilization, among them a species of cloth made of woven hair, and a large number of pieces of pottery. In the sides of the rooms cupboards and shelves were excavated. In one room, sticking out of the bare face of the wall, was a small branch of a tree. When this was pulled out, it was found that there was a hollow space behind the wall Colonel J. H. Stephenson, Major Powell's assistant, broke this with a pick and found a little concealed niche, in which was a small carved figure resembling a man done up in a closely woven fabric, which with the touch of the hand turned to dust. It was blackened and crisp, like the mummy clothes of Egypt. In all, some sixty groups of these lava villages were found, there being twenty houses in each group. The evidences of civilization were similar, but removed by their crudity and evident want of skill a good deal from the articles found in the cliff houses which have been so fully written up in the reports of the geological surveys.—*Santa Fe New Mexican.*

DISCOVERY OF A ROMAN RACE-COURSE AT NANTES.—Archæological researches have recently revealed in the neighborhood of Nantes the existence of a race-course of presumably Roman origin. The foundations of the hippodrome occupy an area of about 223 by 174 meters. Further discovery has been made in the vicinity, of an ancient roadway leading to the Loire, near the banks of which river traces of a number of villas prove the existence of a buried city, inasmuch as a theater capable of accommodating 4,000 persons has been brought to the light of day. A quantity of ornaments, jewels, and pottery has been recovered among the ruins. Thus far the absence of coins has frustrated the endeavors of savants engaged in unearthing the relics to establish the epoch of this most-recently-found city of the Roman occupation.—*New York Evening Post.*

BROWN STAIN FOR WOOD.—A brown stain for wood for the imitation of oak, walnut, and cherry-tree wood is obtained by thinning ordinary tincture of iodine with alcohol, more or less being added of the latter according as a lighter or darker shade of brown is desired. The stain should be applied with a broad brush or a rag. After it has dried, the work should be polished. It is possible, however, to dispense with ordinary French polish by adding white shellac to the stain. One or the other of these processes of polishing is indispensable to give permanency of stain.

Nothing definite has yet been reached regarding a proposed cable street railway at Washington, D. C. The route embraces the central, southeastern, and northeastern sections of the city. It will be a cable road about seven miles long, and the estimated cost is $536,000. The road is to begin from the Bank of Washington, and will take in the museum, the Soldiers' Home, the new Catholic University, Glenwood Cemetery, Government Printing Office, the jail, workhouse, the Congressional Cemetery, the navy yard, etc. The commissioners were favorably impressed with the measures proposed by the company at a recent meeting.

BOOK NOTICES.

Suburban Cottages—Designs and Construction. By W. B. Luthill, A. M.; published by W. T. Comstock, N. Y. *Sent by mail, free of postage, to any part of the world.* To be had at this office, at publisher's price. Contains useful, practical information and plates; 101 pages, 6x10 inches, neatly bound in cloth. Price, $1.50.

A Hand-Book of Legendary Art. By Clara Erkskin Clement. A very interesting and instructive book of 575 pages. Price, $3.00.

American Stair Builder's Guide. By S. D. Gould. Contains 39 original plates and descriptive sheets. Price, $2.50.

Builders' Guide and Estimators' Price Book. By Hodgson; published by the Industrial Publishing Co., N. Y. 331 pages. A book of great value to the contractors and builders. Price, $2.00.

Steel Square and Its Use. By Hodgson. One of the most valuable little books published. Thousands of them have been sold on this coast, and to meet the great demand, have secured a large supply. Price, $1.00.

AN EXTRAORDINARY OFFER.

To All Wanting Employment.

WE want Live, Energetic, and Capable Agents in every county in the United States and Canada, to sell a patent article of great merit, ON ITS MERITS. An article having a large sale, paying over 100 per cent profit, having no competition, and on which the agent is protected in the exclusive sale by a deed given for each and every county he may secure from us. With all these advantages to our agents, and the fact that it is an article that can be sold to every house owner, it might not be necessary to make an "EXTRAORDINARY OFFER" to secure good agents at once, but we have concluded to make it to show, not only our confidence in the merits of our invention, but in its salability by any agent that will handle it with energy. Our agents now at work are making from $150 to $600 a month clear, and this fact makes it safe for us to make our offer to all who are out of employment. Any agent that will give our business a thirty days' trial and fail to clear at least $100 in this time, ABOVE ALL EXPENSES, can return all goods unsold to us and we will refund the money paid for them. Any agent or general agent who would like ten or more counties and work them through sub-agents for ninety days, and fail to clear at least $750, ABOVE ALL EXPENSES, can return all unsold and get their money back. No other employer of agents ever dared to make such offers, nor would we if we did not know that we have agents now making more than double the amount we guaranteed; and but two sales a day would give a profit of over $125 a month, and that one of our agents took eighteen orders in one day. Our large descriptive circulars explain our offer fully, and these we wish to send to every one out of employment who will send us three one-cent stamps for postage. Send at once and secure the agency in time for the boom, and go to work on the terms named in our extraordinary offer. We would like to have the address of all the agents, sewing machine solicitors, and carpenters in the country, and ask any reader of this paper who reads this offer, to send us at once the name and address of all such they know. Address at once, or you will lose the best chance ever offered to those out of employment to make money.

RENNER MANUFACTURING CO.,
116 Smithfield St., Pittsburg, Pa.

MASONS' AND BUILDERS' EXCHANG
OF SAN FRANCISCO
Room 11, 314 Montgomery St

BELOW will be found a list of the members composing this Exchange. Boxes are provided for each member, so that architects, owners, or others desiring the services of any particular member, or those having boxes who are not members, and yet whose business is directly connected with that of the Exchange, can readily secure the attendance of the party sought, by leaving a note in the respective boxes.

"NONE SUCH"
CHIMNEY TOP VENTILATOR

See Cut in this Place next Month.

THIS VENTILATOR is especially valuable for regulating draft (upwards and downwards) made by the light, unstable atmosphere of the Coast Range of Mountains. The hundreds of tall stovepipes erected on the chimney tops of houses indicate inconvenience and trouble in the kitchen, the parlor, and chambers below.

SAN FRANCISCO, October 26, 1885.

To whom it may concern:

I take pleasure in stating that the "None Such" Chimney Top and Ventilator, which was put upon the smoke-stack of the Baldwin Hotel about two months ago, has given complete satisfaction.

It has increased the draft to such an extent that there is a perceptible saving in the amount of coal consumed; smaller fires than heretofore will now answer to keep up the steam, thus causing a great saving of the boiler also. We have heretofore had much difficulty in keeping up the amount of steam steadily required, owing to the lack of draft, all of which is now remedied by the use of the "None Such" Chimney Top and Ventilator. I heartily recommend its use to all persons, where a strong draft is required.

PEARSON & ARNOLD,
Proprietors the Baldwin.

JOSEPH BUDDE'S

PATENT

WATER CLOSETS

WITH TRAP.

The Golden Gate Plug Closet.

WITH OFFSET.

This Closet is the best of its kind, having been so far constructed, it has the following advantages:—

1. It has a simple, strong valve, suitable for any pressure.

2. It has a real sanitary overflow, a copper float attached to a bell of the same metal resting on face of the brass overflow pipe, operated by the rising of the water in the closets above its level, thus absolutely preventing any escape of sewer gas, even the closets being without water.

3. It has no dead corner, consequently no foul water will be left in the closet after the lifting of the handle. A constant rush out of the flood chambers will keep the closet and trap perfectly clean.

This Closet takes the lead; it has been sold since February, 1885, in large quantities to the best satisfaction.

THE COMBINATION HOPPER.

Side View, Combination Hopper.

This hopper is constructed to take 2 2-inch pipes, one to the right and one to the left and a 4-inch leader in the center. It has also a movable strainer on top to take the surface water. The lower part of the hopper with side outlet is to be connected with the sewer pipe, either right or left. The upper part is independent from the lower, and is made to swivel, therefore it will suit either position of pipe. This hopper can be used only for surface, for waste, or for leader; either inlet will be stopped up with iron caps if so desired.

PACIFIC PAN CLOSET.

This Closet is superior to all others, every working part and bolt being made of brass, closet and valve extra heavy casting. Particular attention is called to No. 4. This Closet has an oval basin fastened to the cover by brass clamps and bolts. No breaking of putty joints required to renew a pan. The loosening of two large brass nuts will separate cover with basin from the receiver. It has a heavy nickel plated cup and pull and solid brass rod.

These Closets have been in use since February, 1888. Plumbers and wholesale dealers give them the best recommendation.

Square Slop Hopper. Square Waste Hopper. Basket Hopper.

Basket Hoppers are made in one piece with Movable Strainer.

SCIENCE OF ARCHITECTURE	6

WHOSE who labor to make human actions harmonize, find great difficulty in piecing them together and causing them to assume the same gloss; for in general they contradict each other in so strange a way that it seems impossible that they should have issued from the same workshop.—*Montaigne.*

WHEN we truly and earnestly aspire to be, that in some sense we are; the mere aspiration, by changing the frame of the mind, for the moment realizes itself.—*Mrs. Jameson.*

ONE principal point of good breeding is to suit our behavior to the three degrees of men—our superiors, our equals, and those below us.—*Swift.*

RECTITUDE is the first law of the gentleman: When he says "Yes," it is law; and he dares to say the valiant "No," at the fitting season. The man of rectitude will not be bribed, it is only the low minded that sell themselves.—*Smiles.*

SCIENCE has been well defined to be knowledge reduced to order; that is, knowledge so classified and arranged as to be easily remembered, readily referred to, and advantageously applied.—*C. Davies.*

The Year Begins Well.

SUMMARY OF BUILDING INTELLIGENCE FOR JANUARY, 1886.

62	Frames, total cost	$265,150
4	Brick " "	247,000
13	Alterations and additions	111,100
79	Total cost	$623,250

FOR SAME MONTH IN 1885.

62	Frames, total cost	$236,850
2	Brick, " "	314,000
9	Alterations and additions	39,300
73	Total cost	$590,150
	Less errors in published statement, Jan., 1885	12,435
	Correct totals for January, 1885	$577,715

By the above it will be seen that the building activities for the month ending with present issue leads the same period of 1885 by $45,535.

Its Seventh Volume.

WITH present issue commences the seventh volume of this journal as a monthly, and its eighth, including the quarterly of 1879. As will be noticed, the enlargement, commencing with present number, increases the length of the book two inches, thus adding 576 inches of additional printed matter each month, the number of pages being as heretofore, thirty-two.

Early in its history it was recognized, and by action of San Francisco Chapter confirmed as the official organ of the profession on the Pacific Coast, which enviable recognition it continues to enjoy, and no effort in the future, within possibilities, shall be wanting in rendering it worthy of that distinction.

Situated as we are, far distant from the great principal centers of commerce, manufacturing, building, and other great interests and enterprises of the country, and at the extreme westerly terminus of communication across the American Continent, with not a foot of territory between us and the setting sun, short of the shores beyond the broad waters of the Pacific Ocean, other than the intervening islands; with mountain ranges and vast spreading, barren plains, separating us from advantages at easy command to all our Eastern contemporaries; with entire lack, or high cost of many facilities and things necessary in making up an acceptable journal, its great success is phenomenal.

Sir F. Buxton has well said: "The longer I live, the more I am certain that the great difference between men—between the feeble and the powerful, the great and the insignificant—is *energy*, invincible determination, a purpose once fixed, and *death or victory*. That quality will do anything that can be done in the world, and no talent, no circumstances, no opportunities, will make a two-legged creature a man without it."

It was the spirit of the above quotation that influenced the founding of *this*, the first journal published upon the Pacific Coast, in the interest of architectural and building sciences, and that too under the most forbidding and unauspicious circumstances and conditions, within and without—has sustained it, lo, these seven years, and will be its inspiration in the years to come.

Whatever of abilities or talent may have been lacking in the past, there has been no absence of honest purposes and desires. The great ambition has been to establish permanently, a class publication devoted to the interests represented in this journal, and such has been accomplished to an extent magnificently beyond the expectation of thousands who, in the days of its beginning, doubted the possibility of permanency. But it has been done, and, all things considered, fairly if not handsomely done, and, although "the future is a great land, a man cannot go around it in a day, cannot measure it with a bound, cannot bind its harvests into a single sheaf, and is wider than the vision, and has no end," its hopes inspire and its promises encourage earnest, persevering effort, the fullest developing possible of which the patrons of this journal may expect to realize during the year just entered upon, of which the present issue is the representative number.

Wishing happiness and prosperity to one and all of our kind readers, we ask a return of the consideration, in a renewal and continuation of subscription and advertising patronage, and the generous support that has heretofore come to us from all quarters.

Lien Law Decision as to Proper Time of Filing Lien.

THE Supreme Court of California has rendered an important decision in the case of Perry, Woodworth & Co. *vs.* Brainard, which definitely settles a feature of the lien law which has been a subject of innumerable disputes, some holding that the maturity of claim, by delivery of materials, or the completion of a sub-contract was sufficient without regard to the completion of the building or works; an error also entertained by lawyers not well posted in this department of legal practice, as was manifestly the case with the legal minds who advised and misled the plaintiffs in the above action to file a lien

prior to the proper time, and then further inducing their clients to reject the common-sense and logical decision of the Superior Court Judge, and still further advise an appeal to the court of last resort, only to meet defeat and heavy cost, which in such cases are generally considerably weighty.

The decision of the lower court was that the lien sought to be enforced by the action had been filed *prior to the completion of the building*, and was therefore prematurely filed. Such being the case, judgment was rendered in favor of the defendant and against the lienors. This not being satisfactory, the case was appealed to the Supreme Court, which tribunal confirmed the judgment of the Superior Court.

In support of the decision, Justice Ross—Justices Myrick, McKee, Sharpstein, and Thornton concurring—quotes from the lien law: "Every original contractor within sixty days after completion of his contract, and every person save the original contractor, claiming the benefits of this Chapter, must, within *thirty days after* the completion of any building, improvement, or structure, or after the completion of the alteration or repairs thereof, or the performance of any labor in a mining claim, file for record," etc., and make the "within thirty days after completion," the groundwork of the decision. Other cases of similar import are mentioned, denying the existence of "privity of contract between the owner of the building and the sub-contractor, but the sub-contractor's rights are based simply and solely upon his contract made with the contractor."

The decision further says, by the contract, the owner agrees to pay a certain sum and "this sum is a fund which may be held under the statute for the payment, *so far as it will go*, of all the various sub-contractors, for work and materials furnished by them to the contractor, who is the principal and head of all; and all the parties entitled to payment or contribution out of this fund should be able to reach the fund and get their *proportionate shares*." "One contractor ought not to be able to reach this fund and appropriate it to the extent of his claim before another sub-contractor should reach it, for if the fund *should not be sufficient* to pay the claims of all the sub-contractors, then each should be paid only a *proportionate share thereof*." "The amount of all the claims of all sub-contractors can be ascertained only after all the work and materials have been furnished, and after the building has been completed, so far as the contractor is required to complete the same; for the whole of the work may in fact be done by sub-contractors only, or the last item of work performed or materials furnished may be performed or furnished by a sub-contractor. The building in such a case will be completed by a sub-contractor, and the sub-contractor completing the building or furnishing the last item of work or materials therefor, is entitled to his proportionate share of the general fund, equally with the sub-contractor who furnished the first item of work or materials, or any intermediate portion thereof."

Building Prospects—1886.

AS a matter of course, all statements reaching beyond the present hour, are more or less speculative and hypothetical. But well trained human judgment may safely venture to step a little beyond the limits that hold the future in abeyance, and surmise the probabilities that are to be. The past and present are the measures by which the future may be measured and weighed, and upon which results yet unborn may reasonably be predicated and predicted.

There have been but few years since the organization of this State, in which all the conditions have been more favorable at the commencement of the year, for general prosperity throughout the State.

Timely and abundant rains have gladdened all hearts, in cities and country districts, and the common feeling everywhere prevailing is buoyant and cheerful. Large crops and harvestings are confidently anticipated, and the promise of abundance in all directions seems assured. As a natural sequence, confidence and hope abound in all circles of active life, and the opening of the year 1886 is full of prospective blessings.

Among the prominent good influences affecting and producing this desired state of things, is the turn matters have taken in regard to the Chinese labor question. The monster evil had settled down in our midst, taken strong root, and was fast sending its tendrils into every field of labor, trade, and commerce, until it became bold and defiant, and put forth its shoots in an arrogant strike, demanding the discharge of white men, and asserting the Mongolian right to control at least the cigar manufacturing trade. The serfs and slaves of the six companies felt that they had their fingers firmly fixed upon the throat of labor, with power to crush out all opposition, and master the situation. But the daring, aggressive move made was a grand mistake against the invaders of labor rights, and resulted in the overthrow of a gigantic Mongolian combination. And the outlook to-day for Chinese labor is more gloomy to them than it has been at any period in the history of the State.

The feeling inspired by the results in this connection is of the most pleasing character, and one of the immediate effects is the substitution of several hundred of our own race, some of them with families, as permanent, congenial fellow-citizens, instead of a like number of human beings having no sympathy with the laws, institutions, or welfare of our common country, beyond the mercenary purposes and perversions ever present with that people.

These facts in this connection are material only so far as they bear an influence upon the future of San Francisco, which they do in this wise: that every white person added to population, as against a Chinaman, is a gain in a general sense, as each individual so added becomes a consumer of American product, while the Chinaman spends nothing that can be saved and carried away to his foreign home.

But the more desirable feature of the case is the influences that flow from this improved condition of things; the healthful feeling incited, not only among the working people, but among employers and manufacturers, who feel a relief in the break that has been made, which foreshadows a redemption from the thraldom that has rested upon them, and the prospect of freedom from that cruel competition which so sternly threatened destruction to honest white effort in legitimate pursuits.

Following the movement of the cigar-makers will be the other branches of manufacture, so much demoralized by the invading hordes of Chinamen. The boot and shoe trade, from men and women's fine work, down to common slippers, is largely in the hands of Chinese operatives, and together with many other branches of manufacture, demands the pruning knife of reformation. And as one by one, the white men, girls, and boys reassert their rights to perform such labor, and purify the present polluted streams of operations, a more healthful state of affairs will arise, and, with the Mongolians gone, a bettered condition of things will come to pass, and brighter skies will span the heavens of manufacture and labor upon the Pacific Coast, and lead to numerous building improvements.

All this foreshadows the better future, and points to increased wealth among the working classes, and increased demands for white men's homes. Aside from all this, with the large amount of building done during the past five years, there are comparatively few houses to rent. This fact presents encouragement, and with the low price of all kinds of building materials, and the abundant supply of mechanical labor, it is fair to anticipate a prosperous year in building pursuits.

Without committing the unwarranted error indulged in by some of our daily contemporaries, of inflating prospects by statements of "contemplated work," much of which, as published, not likely of consummation, we may state the assured fact that a goodly number of plans are in preparation in architects' offices, and the outlook for spring is good.

Royal Institute of British Architects.

THE journal of proceedings is regularly received at this office, and contains much of interest, as showing the earnest interest taken by the members in matters pertaining to architectural sciences. The fact cannot be successfully controverted that all such organizations, properly conducted, are a source of special profit to every active member, of general benefit to the profession, and from which the building community derives great advantage.

Stand by the California Journal; Besieged But Not Dismayed.

WITHIN the past sixty days, the Pacific Coast cities and towns, especially San Francisco, have been *fairly flooded* with thousands of sample copies of Eastern class journals. They have been sent from every section of the United States where such journals are published, done up in best possible style, and with every attention to appearances, so as to render them attractive, and catch subscribers.

A host against one. Singly and alone, we are called upon to combat this mighty avalanche of competition—this well-drilled and equipped host of competitors, who come not with modest mien awaiting a welcome, but with bold effrontery and aggressive strides, entering not only workshops, offices and business places of all kinds, but private residences, soliciting patronage and support, and seeking to allure to their subscription net all who can be reached through the devices incorporated in Christmas numbers.

Unparalleled efforts. The number of Eastern journals represented this year, and the mass of sample copies distributed, exceeds, ten times over, those of any former year, from which it is fair to infer that heretofore California has been considered an unpropitious field, or the recognized great success of the CALIFORNIA ARCHITECT AND BUILDING NEWS has influenced a changed sentiment toward this coast among our contemporaries, who, after having failed for so many years to adequately supply the wants of the Pacific States in class literature, are now generously willing to divide with us the crop produced from our planting.

Overdoing. If each succeeding year from the present time shall continue to develop corresponding increase, enlargement and improvement in class journals, that has characterized the past five years, a full decade of years will not have passed ere their patrons will receive monthly issues as large as Webster's Unabridged.

Don't understand. Eastern contemporaries may not be able to comprehend the situation, because their pathways lie through much larger and broader fields, where competition is scattered through scores of adjacent States; but the dumping down in San Francisco of several tons of "sample copies," makes a very decided impression upon the "sample copy" market, and floods it. *But* "he that wrestles with us strengthens our nerves, and sharpens our skill; our opponent is our helper." So we consider it, and not only propose to hold our own in the face of the avalanche of interlopers, but to so far excel them in supplying a journal specially adapted to this coast, that their presence will be *eminently immaterial.*

Support the home journal. Every individual in any manner id entified with, or interested in building matters, whether as architect, owner, contractor, material men or otherwise, should subscribe for this journal.

The Cohesive Strength of Stone.

IN all cases which have come within my notice, the stone possessing the least cohesive strength, or that which will crush with less pressure than any other, is nevertheless strong enough, when once fixed, for almost all practical purposes. No architectural members have to sustain greater pressure, in proportion to their size, than the mullions of large Gothic windows. The tracery in the great north window of Westminster Hall is now executed in Bath stone, which is remarkable for having the least cohesive strength of all the specimens experimented upon and described in the report on the stone for the new House of Parliament. Some of the mullions of that window are less than 9 inches wide and more than 50 feet high, sustaining not only their own weight, but also the whole of the tracery beneath the arch.

The eastern window of Carlisle Cathedral, built of a friable red sandstone, is 50 feet high; the mullions are smaller and the tracery much heavier than in that at Westminster, yet in neither of these examples are there any symptoms of crushing. The cohesive strength of stones is never more severely tested than during their conversion by workmen from the rough state to being fixed in their final situation in a building. During these operations, iron levers, jacks, lewises, and various other implements, are applied, frequently without judgment, and with but little regard to the mechanical violence which a stone will bear; therefore, it may be considered a useful practical rule that, however soft a stone may be, if it resists the liability of damage until out of the mason's hands, there can be little doubt of its possessing sufficient cohesive strength for any kind of architectural work.—*C. H. Smith.*

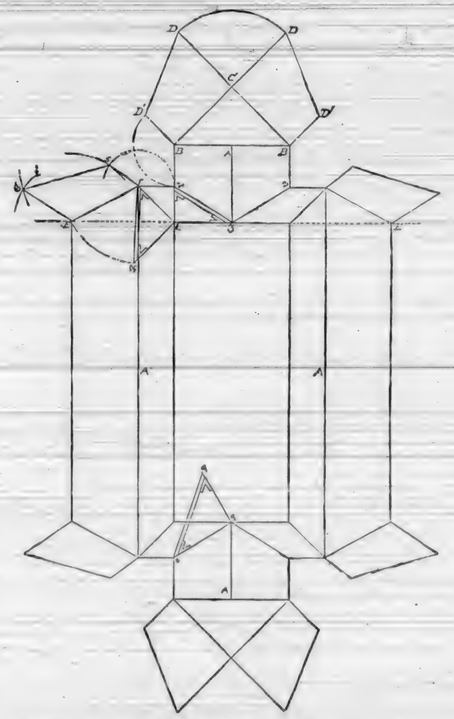
A Graphic Illustration of Roof Framing.

THE following article introduces to the readers of this journal a contributor well and favorably known upon this coast, and in many of the Eastern cities, as one possessing special abilities in the delineation and exemplification of acute and difficult geometrical, mathematical, and mechanical problems, in domes, roof framing, ground arches, and constructural works generally. His monthly contributions will prove instructive and valuable to every architect and mechanic.—ED.]

A GRAPHIC DESCRIPTION AND ILLUSTRATION OF THE METHOD OF STANDING HIP AND VALLEY RAFTERS IN POSITION OVER GROUND PLANS.

Although the science of roof framing and kindred mechanical sciences have for generations received the attention of hundreds of able minds, its simplification is still a matter to be more fully developed. Innumerable methods have been introduced, many of which possess merit, and must be regarded as good. The object of the present and succeeding articles is not to set aside any of the good things done in the same line, but to still further assist in rendering plain, and simplifying, to the clear understanding of the most ordinary mechanical intellect, the matters treated upon.

The method of determining the length and cuts of the members of a structure, by the air of "graphic" diagrams, is practical, accurate, and reliable, and commends itself especially to the student of architectural, engineering, and mechanical sciences. By its simplicity and conclusiveness, and the absence of technical phrases and algebraic symbols, the uneducated and less learned cannot fail, with but little study and application, to understand and comprehend its intricacies.



The usual process of calculation when applied in detail, becomes laborious and wearisome even to the professional mind. Hence the ease and accuracy with which the general result is reached by the graphic method, commends itself even to the less cultured, as superior to any system that requires long calculations and mental effort. The method of graphic diagrams offers better facilities—those denied by the more complicated principles—and enables the reaching of results by a simpler and less difficult process.

Explanation: Draw ground plan, A A A A; draw the elevation, B C B; square out from the back of the common rafter, B C, both sides, C D and B D, as shown; take B 2 in the compass, describe the curve, 2 D, cutting line, B D. Now take the distance A 3, line from face of gable to line of deck on the level; set compass to the distance A 3, and stand in C with it, describing the curve, cutting the lines squared from the back of common rafters, at D D; connect D D^1; now we have the length of valley rafter to stand in position over 2 3.

Now to get the length of timbers and cuts in the deck of the building, continue the deck lines, E E; make a seat line, 1 1; square up to 4; 1 to 4 is the height of elevation; 4 ^{1}1 is the length of deck rafter; take the distance ^{1}1 4, and describe curve, cutting deck line at E; ^{1}1 E is the length of rafter to stand in position over 1 ^{1}1. Now we come to the more difficult part of the cuts to be found. Examine the ground plan, and connect the line 2 I, and square up to 3; make 1 3 equal to the height of the elevation; now take 2 3 in the compass, and stand in E with it; describe the curve, X X, from E; now take another compass, and take the distance ^{1}1 2, and from ^{1}1 describe from 2; cutting curve,

X X, from E, the point now found, 5, is an important one, as it finds the direction and lean of timber when in position.

Now to find the point 6 is all that is needed to get at all of the cuts and lengths of timbers; move to the other end of plan; draw line, 7 8; square up to 9, 7 9 being the height of elevation; connect 8 9, and take it in the compass; come back to 5; stand in 5; describe curve, cutting at 6; now take the distance 1 3 in the compass, and stand at E and draw the curve 2 2; when they cut at 6, connect E 6; then 6 E is the distance that will lay level in position over 1 3 in the ground plan. Repeat that same rule on the four corners, and cut all around the outside edges; hinge and stand up, and you will have a model showing every timber in position. Weaken with the back of a knife or compass, on each hinge line, and stand up on the ground plan line; cut all around the outside of the figure, and there can be no possible mistake. In the next diagram another form of roof will be treated. Models in card-board, illustrating the foregoing, can be seen at the office of this journal.

M. J. Marion.

Mr. Garrett's Porch.

In our November issue we gave a brief account of the unfortunate litigation between Messrs. Robert Garrett, President of the Baltimore and Ohio Railroad, and his neighbor, Henry Janes, the millionaire merchant of that city, by which the latter has sought to prevent Mr. Garrett's erection of a certain porch in front of his palatial residence, now building on Mt. Vernon Place; and we remarked upon the ambiguities and puerile contradictions which are so apt to characterize our building ordinances. The latest intelligence is that Mr. Janes has announced, that in case his suit fails to stop the erection of Mr. Garrett's porch, he will relieve himself of its obnoxious proximity by moving out of his own residence, which he will then donate to the Colored Orphans' Association of Baltimore for use as an asylum for their dusky *proteges*. Here's a "how-d'ye-do," unquestionably, of a very pronounced type, and one that affects not only Messrs. Janes and Garrett, but all the other residents of this especially aristocratic section of Baltimore. It suggests remark upon the great desirability of so amending our legislation against nuisances as to protect public-spirited citizens, who have erected costly homes, from wanton spoliation by the recklessness or malice of a neighboring owner. It is plainly a crying outrage if all the other residents in Mt. Vernon Square must have the value of their investments in that section, amounting to many hundreds of thousands of dollars, imperiled by a quarrel between neighbors Janes and Garrett, in which the neighbors have no part and which they are helpless to control. It is a well-understood principle that no man has a right to use his property so as unnecessarily to injure that of his neighbor, and in all cities there are laws which in this view prohibit the erection of slaughter houses, rendering establishments, and other unhealthful nuisances.

But the law fails to recognize the fact that there are many erections which cannot be strictly defined as injurious to health, which yet destroy the value of adjacent property just as completely. Such is the case above cited. If Mr. Janes establishes his colored orphan asylum next to Mr. Garrett, the result cannot fail to be a disastrous depreciation in all the property on Mt. Vernon Square. In St. Louis, recently, a livery stable proprietor drove a profitable trade for several years by purchasing lots in a choice residence section and advertising his purpose to build a stable there. In a number of cases he was bought off only by the payment of a large bonus from the adjacent property owners, whereupon Mr. Russell would immediately select another lot and repeat the transaction. For a while this fellow established a sort of reign of terror among property holders in the finer parts of the city and earned the title of "livery stable fiend," and he recently had an imitator in Chicago. Of course we cannot here outline the necessary enactment to protect the community from such outrages, but it will doubtless provide for a considerable enlargement of the definition of the term nuisance so as to cover injury to property as well as to health.—*Inland Architect and Builder.*

Toughening Timber.—An exchange says: It is claimed that by a new process white-wood can be made so tough as to require a cold chisel to split it. The result is obtained by steaming the timber and submitting it to end pressure, technically "upsetting" it, thus compressing the cells and fibers into one compact mass. It is the opinion of those who have experimented with the process that wood can be compressed 75 per cent, and that some timber which is now considered unfit for use in such work as carriage building, could be made valuable by this means.

Real Estate Transactions, 1885.

Nothing more clearly indicates the degree of prosperity prevailing in any city or locality than the number of real estate transactions, and the prices paid for building lots and land, under a well-balanced market uninfluenced by either depressed or excited conditions.

The real estate circular furnishes the following items of facts: Sales in 1884, 3,874; value, $13,374,207. In 1885, 3,650; value, $13,250,000. City hall lots have increased in value, twenty per cent within twelve months, the present prices being from $850 to $1,000 per front foot, for a depth of one hundred feet. The cable road street-cars have been instrumental in retarding increase in values in the older districts of the city, and increasing those in the outlying sections, where, a few years ago, and until the extension of the cable roads, they remained at nominal prices. The difference in time required to reach localities ten blocks beyond the old limits is a matter of small consequence, requiring less than one minute per block.

Two years ago a lengthy article appeared in this journal, advising the immediate improvement of all lots on Market Street, inside of Ninth Street, with substantial first-class buildings. If this had been done, there would now be clustered around the city hall center, the natural centering point in this city for large retail stores for generations, if not for all time, one hundred or more prosperous business firms. All this is destined to be at a not remote period. The pioneers in this direction are the new Odd Fellows' Hall, with its fine stores, and the Murphy Building now occupied by one of the most enterprising and progressive dry goods firms in the city. The three-quarter million dollars spent in the erection of these two edifices simply reflect the character of future improvements in that neighborhood; in fact, those who own property having a market value of $1.000 to $1,500 per front foot, cannot afford to do less than erect very fine, *first-class* structures.

Mr. Magee, of the *Circular*, most excellent authority in all matters connected with real estate, says: "All of Market Street, as far out as Valencia, would now be fine retail store property, if the owners would only build suitable stores on their land. The city hall lots should have been built on five years ago." So it was strongly urged and argued by us two years ago, and we appreciate endorsement from Mr. Magee, even at the present time.

It is but a matter of time when this will be done, and business pushed *solid* out to Ninth Street. "Out to Valencia Street," about four blocks further westerly, might properly be improved with frame structures to last a few years and then give way to more permanent buildings.

Business for architects. The foregoing foreshadows future prospects for architects. Even the older portions of the city present a large field of work to be done in the removal of old and worn-out buildings, and the substitution of new edifices of greater or less cost; in addition to which will be all the growth in residence improvements which follows business enlargement and progression, and the erection of large brick buildings on principal streets, will necessarily stimulate improvements on all cross and adjacent streets, and in neighborhoods where some must locate to obtain lower rent rates.

Fall of a Brick Wall—One Man Killed.

While the December number of this journal was being worked off, a rather sad affair happened on Seventh Street, in the city of Oakland, resulting in the death of a human being, who was standing idly upon what proved to be a fatal spot.

A brick building, twenty-two feet frontage, and three stories in height, was in course of construction, and so far advanced as to be up to the level of the third floor joist. A cast-iron girder was placed at the proper point to provide for the store front openings. About the girder, and resting thereon, were the two side wings or sections of brick-work, the center portion of the front wall being omitted to provide for building a bay-window through each story, twelve feet wide.

Without any sign or warning, the iron girder dropped to the ground floor, and with it fell in a mass all brick work resting on the casting, and a portion of the westerly wall, the easterly wall being a party wall. The man killed was standing directly under the girder and front wall, at the time of the occurrence, and was badly crushed.

There are two reasonable accountings for the let-down: one, that the girder was defective, and yielded under the superincumbent weight placed upon it; the other, that the

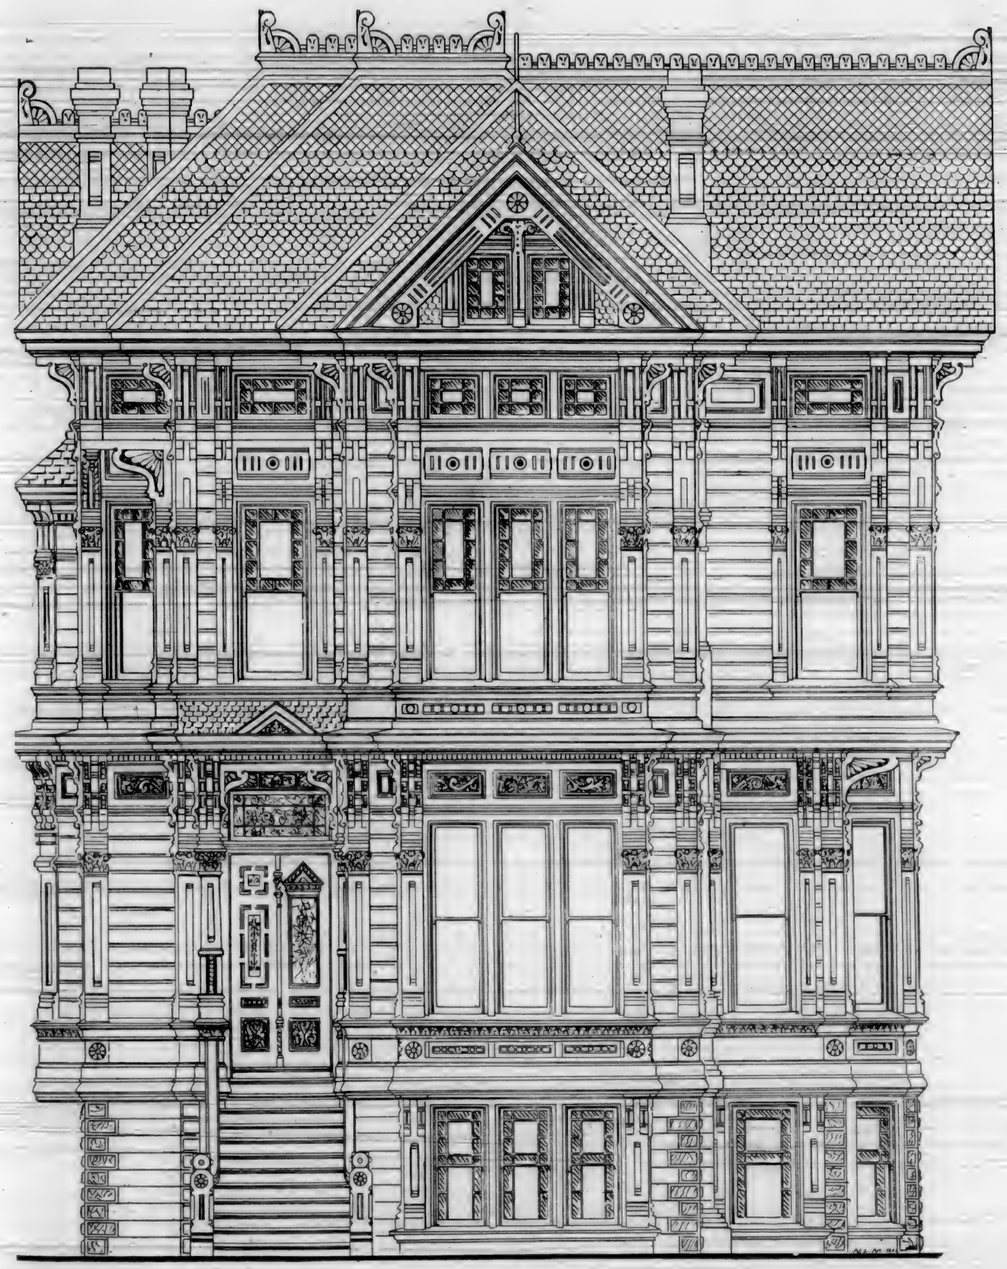


PLATE I.—FRONT ELEVATION.

brick seating on which the westerly end of the girder rested, gave way, owing to the soaked condition of the bricks from the heavy rains, and the soft mortar in the joints, the cement in which had not set sufficiently to produce any hardening effect. The wall that fell, facing the heavy rains then so copious and continuous, very naturally kept the new brick work very tender, and added greatly to the general weight; and it is altogether likely that the secret of the tumble was in these suggestions.

The girder was defective, in that there was a flaw in the bottom plate, which, although 1¼x14 inch, was rendered of no value by the flaw. But the center rib, 1x24 inch, with a top or crown flange, 1x5 inches, was more than sufficient to carry safely all the load imposed, with no more than five feet of front wall at the sides of the building.

S. F. Chapter of Architects.

OWING to the regular meeting night falling on New Year's, no session was held for the month of January. It is to be hoped that the members of the profession will re-double their interest in the Chapter work the current year. There are possible results which should call forth the united energies and efforts of every architect upon the Pacific Coast.

Commingling and friendly intercourse is necessary to a healthful life, and every hour spent in developing that which may be attained by fraternal association is as seed sown in good ground.

Self-preservation, if no higher purpose, should induce every reputable practicing architect to unite in right effort to preserve the integrity of the profession, which of late years has suffered so much from the innovations of the scale bugs, teredos and other ruinous and destructive professional insects.

P. S. A called meeting of the Chapter was held on the 8th, but being out of the regular order of time, but few were present. After reading of minutes, ordering payment of bills, and receiving the application of Mr. Seadler, of Sacramento, to become a fellow, the Chapter adjourned to meet the first Friday in February.

Nature and Art in Arboriculture.

IT does not need the arguments of Hazlitt to convince anybody who will give five minutes' consideration to the subject," remarks the *Daily News* of Monday last, "that we have no source but nature from which to borrow ideas of real beauty, and nature never yet gave us a single example of a flower-bed laid out with geometrical figures, or a flowery bank cut up by zigzags and straight lines. Nature abhors a straight line almost as much as she does a vacuum, and all her operations in woods and fields are a perpetual protest against formal regularity. No doubt it is our right and our privilege to prune and pinch, to tie and train 'the growth of the luxuriant year,' and if we insist upon it, nature will fall into line, but only under protest. We may plant and prune as we please, but if we want really beautiful effects, we must, after all, be guided by the principles on which nature works in all her loveliest achievements. 'The art itself is nature,' as Shakespeare profoundly expresses it, and we must conform to nature's laws, or all the beauty we shall attain to will be of a bad and bastard type, however much we may admire it for a time. It will be but of the type which Pope so neatly satirizes when he speaks of the garden where grove nods at grove, each alley has a brother, and half the platform just reflects the other. This is the journeyman artificer's style of garden planning—the cunning of the compass and the straight edge. We have had enough of this sort of thing and are tiring of it. What we want is a new style, in which the freedom and irregularity of nature are combined with the neatness and order that should characterize the garden plot—the order which is Heaven's first law, not the order which delights in clipping shrubs into exact spheres, which always will have tulips planted in beautiful straight lines, and exactly so many inches apart, and which year after year has, for the sake, we suppose, of a neat and orderly appearance, nipped and clipped all our embankment planes into sprouting scaffold poles, utterly destroying the natural characteristics of these fine free-growing trees. The 'mixed border,' as at present managed, is not altogether satisfactory, though it is pretty safe to predict that it will be in the direction of the mixed border combined, perhaps, with the massing of color shown in the formal beds that future developments of flower-gardening will be effected. We have in some of our parks and public gardens many an odd corner in which nature and art are combined with exquisite effect; but as yet these odd corners are the minor features of our public gardening, and stars and garters, stripes, circles, squares, gridirons, bootjacks, and hot-cross buns, are still predominant, and very often they are worked out in colors that strike the cultivated eye as the squeak of an ungreased wheel assails the ear. Now is the time to brood over these things, and plan something better for the ensuing year."—*Timber.*

Science of Architecture.

[Special for this Journal. By F. Hillert, Architect and Mechanical Engineer.]

(Continued.)

THE purpose of the expansion apparatus is to take the increased volume of water, increased by the expansion capacity of heat. For the size of the apparatus, see the same for water heating, which is located at the highest point of the arrangement. Since the water is heated to 200° *celsius*, the highest point must be closed. By reason of this condition the expansion apparatus is a pipe closed and filled with air (expansion pipe), or is a suction and compressing valve (expansion valve) surrounded and closed in by the expansion reservoir.

The expansion pipes have a width of 60 to 70 mms. ($2\frac{5}{16}$" to $2\frac{11}{16}$"), and its length is from $\frac{1}{40}$ to $\frac{1}{50}$ of the whole string of pipes. The expansion pressure valve must be so loaded by weight (inclosed in the reservoir) that at a pressure of about 15° atmospheric the same opens, and the expanded water by heat flows into the reservoir; the expansion suction valve at the cooling of thearrangement permits the water (contracted in the pipe) to run in and fill up the system from the reservoir.

III. MEAN OR MIDDLE PRESSURE WATER HEATING.

This system can be deducted from the warm (low pressure) water as well as from the hot (high pressure) heating.

From a warm water (low pressure) heating arrangement a middle pressure heating can be made, when, as in the high pressure heating, the highest point of the pipe is closed by a pressure valve, furnishing the possibility of heating the water above 100°.

From a high pressure heating apparatus we obtain a mean pressure heating arrangement, so soon as the first is calculated, that the required heat in the room is so arranged that the water in the fire-coil is not heated above 120°.

The advantage which the warm water middle pressure heating apparatus has over the warm water low pressure arrangement is in the somewhat smaller first cost. The disadvantages are, in the higher pressure all the parts have to sustain by the insertion of the pressure valve.

The advantage which the middle pressure heating apparatus has over the high pressure, consists in the smaller tension in the fire-coil, and in the lower temperature of the water, giving a milder and less strong radiating heat, a larger reserve of hot water. The disadvantages are only in the first higher cost of the arrangement.

Apparently, in general, for warm water heating the form of low pressure is the most recommendable, and for hot water heating that of mean pressure.

STEAM HEATING.

The same depends on the extraction of the so-called latent heat of the steam. In a similar manner, as with water heating, steam is conducted to heaters placed in rooms to be warmed. In the heater the condensation of the steam to water sets free the latent heat to be given over to the walls of the heater, and by the same distributed to the surrounding air.

The important parts of the steam heating arrangement are: (*a*) the steam boiler; (*b*) the conducting pipes for the steam and for the condensed water; (*c*) the condensation apparatus.

The steam boiler for steam heating is constructed on the same general principles as a steam boiler for industrial purposes. Important for boilers for heating purposes is the volume of water and the tension of the steam. The first (water) is selected in large quantities, since the use of steam is very irregular. The use of steam is large at the starting of the heating, before a constance of heat distribution in the system is arrived at. Tubular boilers are, in general, less to be recommended than smoke-flue boilers Under certain conditions it may become necessary to use tubular boilers, which may be the case when the same is placed under rooms which are occupied, a municipal regulation forbidding the putting up of common constructed boilers in such places, which may be avoided by using the tubular boiler (so-called inexplosives). They all agree in this respect, that, through the small quantity of water and steam in them, a considerable large damage by explosion is excluded.

The use of such boilers calls for a very careful attendance, and a larger measure of water-feeding capacity, since by the small volume of water in the tubular boiler and the large

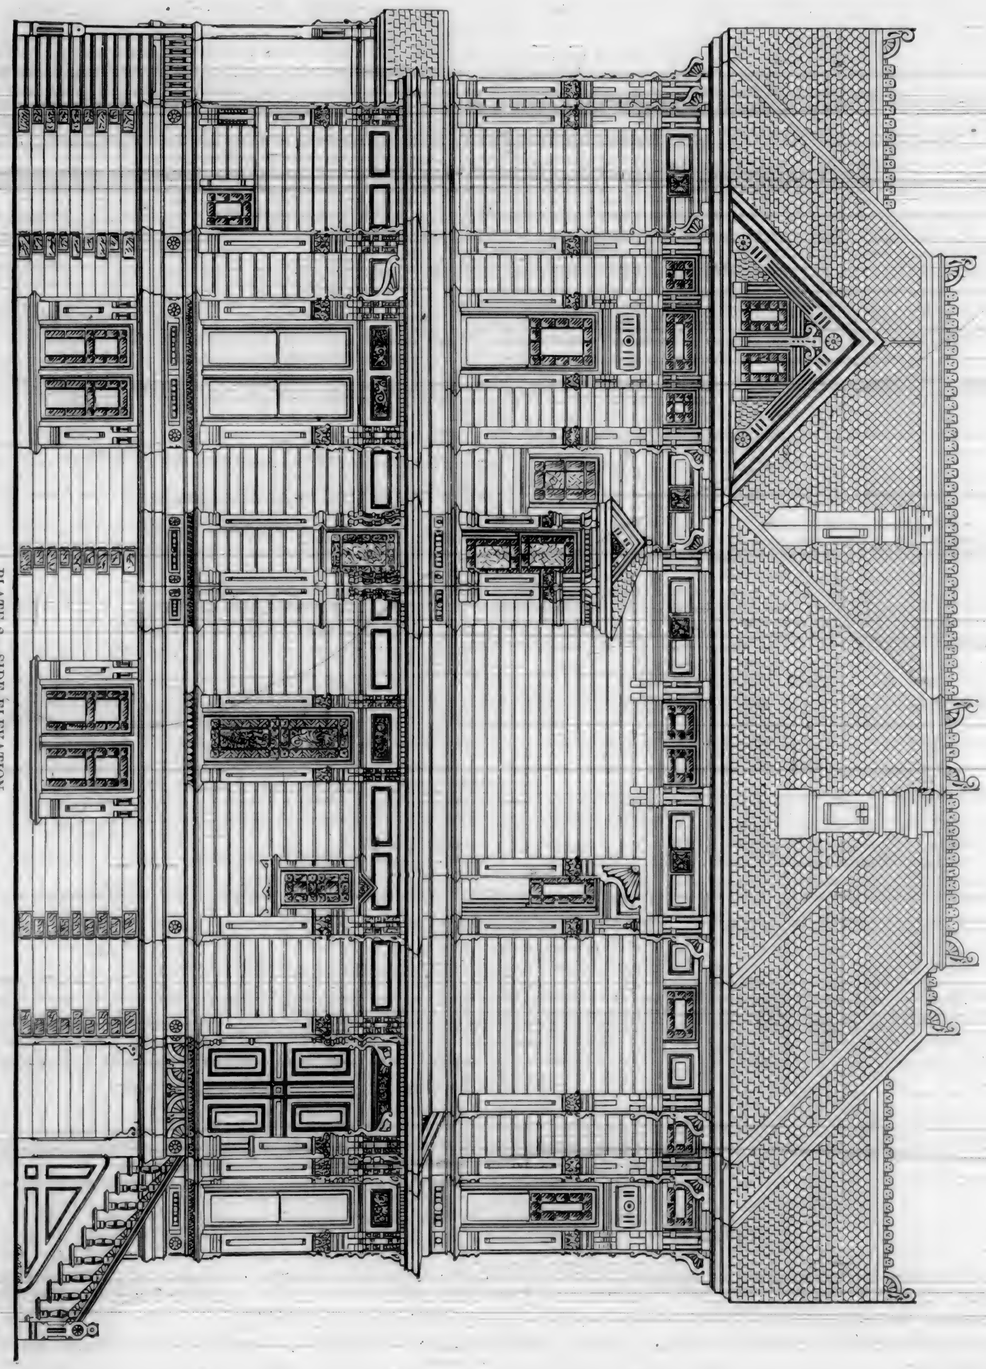

PLATE 2.—SIDE ELEVATION.

heating surface of the same, it may happen, at the beginning of the firing, to be impossible for the feed-pumps to supply—by the fast creation and use of the steam—the loss of water in the boiler as fast as required.

The feed apparatus for tubular boilers, according to those circumstances, have from two to three times the capacity of those for boilers with a large quantity of water.

For the pressure in the boiler, if possible 3 to 4 atmospheres can be taken; for pipes and heater, not above 2° atmospheres. The reduction of the pressure is made by a so-called reduction valve. For feed water for the boiler the condensed water of the heaters should be used as much as possible.

In the disposition of the steam conducting pipes special care must be taken to avoid a cooling off of the pipes as much as possible, and the condensation water to run off with the direction of the steam. The best manner is to lead the steam in a main pipe direct to the highest point of the arrangement, and from there conduct the same by the shortest route to the heater. Is this method of conducting impossible by local reasons? And when there should be a necessity to place the main conduit of the steam lower than the heater, then the conducting pipes in all cases must run ascending, the incline to be in the direction of the motion of the steam; also, care must be taken that the condensing water has an outlet at its lowest point. All branching off for steam must be made at the upper circumference of the main steam conducting pipe.

When more heaters are to be placed in the different stories above each other, the common steam-conducting pipe can be used for the condensing water conduit from the heater, by connecting the admitting and discharge pipes from each heater with the steam pipe, and insert in the connecting pipe of the discharge a "back-lift valve," which must be so balanced that, when the surface of the condensation water in the heater reaches a certain height, this column of water will open the same, giving an opportunity for the water to escape. The steam pipe, arranged for the common use of steam and water, is not recommendable; it is difficult to remove the air accumulated from the heater, the action of the back-lift valve making a disturbing noise all along the pipe. It is therefore better to arrange separate steam and condensing water pipes, and insert in each of them, with the boiler, a valve.

The section of the steam pipe should be taken at least as large as the section of a safety valve required for a boiler, to furnish the needed amount of steam. For long conducting pipes this manner of calculating—taking from praxis—is insufficient, and it is then to be recommended, to make correct calculation, considering all the losses of pressure and resistances.

Pipes not used for the emitting of heat should be protected by surrounding them with non-conducting material, and care must be taken that by the interpolation of "compensators" and movable bearings, the expansion of pipes does not produce untightness and leaking.

The condensation water—draw off—pipes, which must also be run with care, must descend continually to the end. The diameter of the same—steam having a 1696 larger volume than the formed condensation water—can be much smaller than the steam pipes; but it also must be considered that the condensation water conduits, at the beginning of the heating and before the state of continuance is established, the condensation being more intense, must carry off quick all the condensed water.

The heater applied for steam heating is similar in form as the warm water heater described before. In the construction of the same, precaution must be used to prevent any untightness and leakage by the sudden start and letting on of steam. All tightening of joints, etc., must be made with metallic or mineral stuff; all organic matters are, therefore, to be excluded.

For the calculation of the heater the previous formulas for warm water heating can be used; as an average figure may be taken, that a wrought-iron steam heater can condense in the state of continuance—the temperature of the surrounding air being 20° 1.5 kg. (3.31 lbs.) of steam per square meter (10.76 sq. ft.) in an hour's time, emitting about 800 units of heat, provided that the surface being washed by the steam is like the heat-emitting surface. With other heaters a corresponding lower (heat-emitting) figure must be brought in account. Special precaution must be taken, and means provided for the removal of the atmospheric air from conducting pipes and heaters; also when the system is placed out of work, and air to be admitted. For this purpose air valves are to be put in, to be opened and closed by hand, or self-acting arrangements being attached to do this hand work effectively in the proper time.

The three systems of central heating first discussed may be combined to the forms (1) Water air heating; (2) Steam air heating; (3) Steam water heating.

The two first combined heating arrangements are to be constructed by uniting the calculations for air and water respectively steam heating. With both kinds all the warming apparatus can be placed in one heating chamber, and from the same conduct the warm air, as with air heating, to the rooms to be heated. Or, right square under the rooms to be heated is placed a heating chamber, and led to the same from a common fire-place, the warm water representing the steam. By the last method we have the advantage, that the warm air can ascend perpendicular, and that for large horizontal distances a single fire-place is sufficient.

The steam water heating arrangement can either be executed as a warm water heater, by which the water is not heated direct by the fire, but by steam; or an oven for a steam heating apparatus is constructed, containing and holding a larger quantity of water which is heated by steam, thus supplying a large reserve for heating after the steam has been shut off. It may be recommended to name an apparatus after the first arrangement "Steam warm water heating.' This system is, on account of its expensiveness, only at such single instances to be recommended where the different warm water heating arrangements shall be served from a single fire, and the horizontal extension does not permit a concentration of the heating boilers. The second combined system, properly called "steam water heating," has of late been frequently applied for rooms where a quick warming with a longer "after heating," as with warm water, is desired.

The heaters for steam water heating, which do exist in many various constructions, can be classified in the direct and indirect. The direct water heaters contain a space filled partly with water, the other part with steam, heating gradually the water. By the indirect steam water heaters, the space for the water and for the steam is separated, and the transmission of the heat from the steam to the water is done through a common surrounding wall.

Saw and Hatchet Carpenters.

THEY are getting to be pretty plentiful of late. They always appear in great numbers when times are dull and regular skilled mechanics are slack of work. But it may be necessary to explain to some of our readers what a "saw and hatchet" carpenter is. He is a man who has no regular trade or business, but has learned to use a hand-saw and hatchet so as to be able to put up a tolerably passable rough board fence. He then considers himself a jack-at-all-trades, and is around in season and out of season making bids on all sorts of jobs, from a chicken-coop up. There is nothing he will not undertake to do, and if he can arrange to get the material on credit he don't allow any such slight consideration as the price of the job to prevent his getting it. His hatchet is not the genuine G. Washington brand, and generally serves a better purpose in beguiling the unsuspecting citizen into giving him a job, or the accommodating lumber dealer into furnishing him the material, than in the actual execution of the work.

To an inquirer not personally acquainted with the skill of carpenters of the city, business in the building line would appear phenomenally dull. It is the saw and hatchet gentlemen who make nearly all the complaint. It is true that many worthy and competent carpenters are slack of work, and the price of their labor fluctuates with the demand for their services. It is impossible to fix uniform prices on small rough jobs or house repairs, where the saw and hatchet man abounds. They are nuisances to the retail lumber dealer and the dealer in building material. They ruin the business of the honest, skilled mechanic, who has served his time and mastered the trade, and produce unsightly "puckers" around the mouth of the retail lumber dealer, who so very often has to "whistle for his pay." An instance very recently was brought to our notice where an unsophisticated property-owner—a widow—asked for bids on some cheap building. The bills for the material aggregated $570, and the bids ran all the way from $800 down to $500. Of course the saw and hatchet man got the job, and made whatever he got for it off the lumberman and the employés, and it is natural to suppose that the widow got a poor class of cheap work. We have reason to believe that the class of workmen we allude to is not confined to any particular locality, but prevails over the entire country to the great detriment of the skilled mechanic and annoyance of the lumber dealer, besides being an imposition on the citizen. A reform in this matter is much needed. If a citizen has work that is needed at all it is worth doing well, and ought to be worth a fair living price.—*Southern Lumberman.*

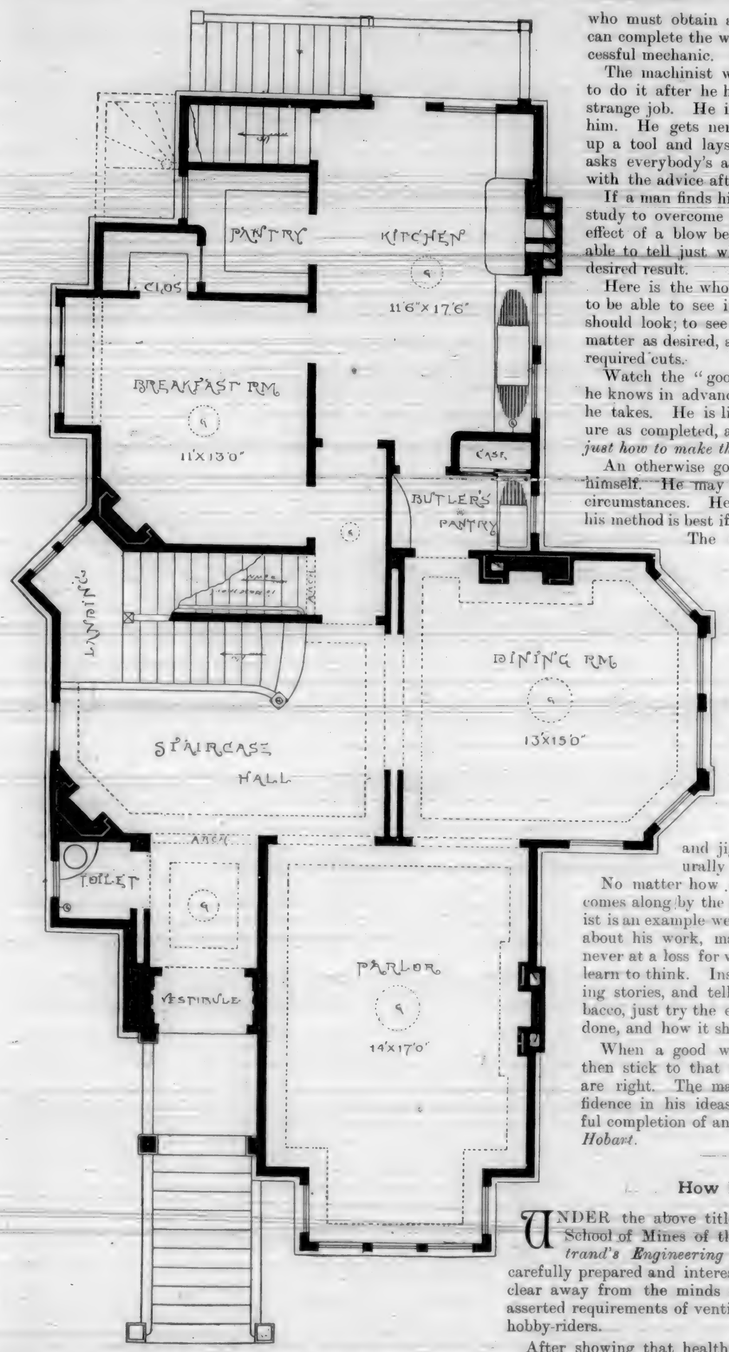

PLATE 3.—MAIN FLOOR PLAN.

Confidence.

CONFIDENCE in one's self goes far toward success. The machinist who is able to go about an ugly job feeling sure that he can devise ways and means for successfully completing the work, is the man who is valuable to his employer. A man who knows how to think, is apt to be such a man, while the man who must depend upon some job he has done before, or who must obtain an idea from his neighbor before he can complete the work, is not the man to make a successful mechanic.

The machinist who don't know what to do, or how to do it after he has got a hint, is a sorry chap on a strange job. He is in misery, and so are all around him. He gets nervous, jumps here and there, picks up a tool and lays it down again without using it; he asks everybody's advice, and don't know what to do with the advice after he gets it.

If a man finds himself in this condition he ought to study to overcome it. Let him learn to think out the effect of a blow before he strikes, and he will soon be able to tell just what kind of a blow will produce a desired result.

Here is the whole secret of being a good mechanic: to be able to see in advance just how a finished job should look; to see what cuts are needed to shape the matter as desired, and to know just how to make the required cuts.

Watch the "good machinist" and you will see that he knows in advance exactly the effect of every action he takes. He is like a good artist. He sees the picture as completed, and knows what marks to make and *just how to make them.*

An otherwise good man may have no confidence in himself. He may be too easily led by surrounding circumstances. He may underestimate himself, when his method is best if he only had the nerve to stick to it.

The other extreme is often met with. The "self-sufficient" workman is the man.

What he doesn't know about a job, never ought to be known. This man is another who doesn't know how to think. He sees or hears of a certain way of doing, and advocates that method without thinking why and wherefore, or if the method he advocates will have the desired effect.

The thinking machinist is neither of the above men. He is between them, and never reaches either extreme. He thinks when he is not aware of it, and methods and jigs suggest themselves to him naturally

No matter how ugly the job, a way to do it always comes along by the time it is wanted. Such a machinist is an example well worth following. He goes quietly about his work, makes no fuss or confusion, and is never at a loss for ways and means. Let us, therefore, learn to think. Instead of running our brains on telling stories, and telling which is the best brand of tobacco, just try the effect of thinking out how work is done, and how it should be done.

When a good way of doing a job is thought of, then stick to that way, and have confidence that you are right. The man who thinks is apt to have confidence in his ideas, and can go ahead to the successful completion of any job that comes to him—*James F. Hobart.*

How Much Ventilation?

UNDER the above title Mr. James L. Greenleaf, of the School of Mines of this city, has published in *Van Nostrand's Engineering Magazine* for November, 1885, a carefully prepared and interesting paper, designed, as he says, to clear away from the minds of some people a feeling that the asserted requirements of ventilation are made by enthusiasts and hobby-riders.

After showing that healthy men are constantly vitiating the air in which they live, and that the dangerous and unpleasant impurity thus added to the air is mainly the organic matter given off from the lungs and skin rather than the carbonic acid, he goes on to discuss the practical question, "How much air is necessary per individual to keep the impurities down to a safe limit?" His conclusion is that if we are content with a somewhat tainted air, from 1,500 to 1,800 cubic feet of fresh air per head per hour will answer, but that if we wish the air in our rooms to be entirely free from traces of mustiness, and to be perfectly fresh

to the senses, the supply must be from 3,000 to 4,000 cubic feet per head per hour. The paper is one that should be read by all architects and by all who are interested in the subject of ventilation.

Finishing.

WOOD finishing is the process of applying to the surface after it has been prepared, by filling and smoothing, or otherwise, a thin coating of varnish or other substance, to render it durable, enhance its beauty, or change its appearance. There are numerous methods of finishing, and a variety of materials are used, the varieties of varnish being the principal. The distinctive qualities of these varieties are treated under their proper headings.

In their natural state all woods are more or less porous, consisting of bundles of hard fibers, with interstices filled with a softer substance. These constitute the grain, and as the hard or soft parts predominate, the wood is said to be hard, fine, or close-grained, or soft and open-grained. To fill these softer parts, or pores, and give to the whole an even, uniform surface, hard, and capable of a brilliant polish, is the object of the finishers' art. This hard, firm surface was formerly gained by the successive application of several coats of varnish, at least three preliminary coats being required to fill the pores; the inequalities were then reduced by fine sand or glass-paper, and several additional coats laid on, the last, after becoming thoroughly hard, being polished if desired. In this operation, however, a great quantity of varnish is absorbed by the open pores of the wood, and it is consequently so expensive that it is now seldom used. Recourse is therefore had to various plans to render the wood non-absorbent before applying varnishes, and certain compounds called fillers are largely used for this purpose.

Richness of effect may be gained in decorative wood-work by using woods of different tone, such as amaranth and amboya, or inlaying and veneering. The Hungarian ash and French walnut afford excellent veneers, especially the burls or gnarls. A few useful notes on the subject are given by a recent American authority. In varnishing, the varnishes used can be toned down to match the wood, or be made to darken it, by the addition of coloring matters. The patented preparations, known as "wood fillers," are prepared in different colors for the purpose of preparing the surface of wood previous to the varnishing. They fill up the pores of the wood, rendering the surface hard and smooth. For polishing mahogany, walnut, etc., the following is recommended: Dissolve beeswax by heat in spirits of turpentine until the mixture becomes viscid; then apply, by a clean cloth, and rub thoroughly with a flannel or cloth. A common mode of polishing mahogany is by rubbing it first with linseed oil, and then by a cloth dipped in very fine brick-dust; a good gloss may also be produced by rubbing with linseed oil, and then holding trimmings or shavings of the same material against the work in the lathe. Glass-paper, followed by rubbing, also gives a good luster.

Logwood, lime, brown soft-soap, dyed oil, sulphate of iron, nitrate of silver exposed to the sun's rays, carbonate of soda, bichromate and permanganate of potash, and other alkaline preparations, are used for darkening the wood; the last three are specially recommended. The solution is applied by dissolving one ounce of the alkali in two gills of boiling water, diluted to the required tone. The surface is saturated with a sponge or flannel, and immediately dried with soft rags. The carbonate is used for dark woods. Oil tinged with rose madder may be applied to hard woods like birch, and a red oil is prepared from soaked alkanet root in linseed oil. The grain of yellow pine can be brought out by two or three coats of japan, much diluted with turpentine, and afterwards oiled and rubbed. To give mahogany the appearance of age, lime water used before oiling is a good plan. In staining wood, the best and most transparent effect is obtained by repeated light coats of the same. For oak stain a strong solution of oxalic acid is employed; for mahogany, dilute nitrous acid. A primary coat or a coat of wood fillers is advantageous. For mahogany stains, the following are given: two ounces of dragon's blood dissolved in one quart of rectified spirits of wine, well shaken, or raw sienna in beer, with burnt sienna to give the required tone; for darker stains, boil half a pound of madder and two ounces of logwood chips in one gallon of water, and brush the decoction while hot over the wood; when dry, paint with a solution of two ounces of potash in one quart of water. A solution of permangate of potash forms a rapid and excellent brown stain.

True and False.

THE statement of building intelligence for 1885, as appearing in December number of this journal, and in the *S. F. Chronicle Alta, California*, and other journals that used our table of facts, were correct. The statement in an evening journal, making the sum of expenditures $7,858,110 was not true, except in this,—to take the total sum of reports appearing in this journal, and upon general principles adding thereto ten per cent, which gives the exact figures of $7,858,110. But this was not honest journalism, as the figures given by our contemporary were presented to the readers of that journal as *original facts*, while in truth the reports of this journal were taken as a basis, and the ten per cent added, without one word of credit to us for the pilfering done from our columns.

The attempt of the journal referred to, to furnish weekly building reports in *imitation* of our monthly, are lamentable failures. To make up large lists and delusive showings, our files of two months or more back are sometimes resurrected and paraded to swell up the list; cases are reported which have no existence in fact; small jobs of a hundred or two dollars are magnified into respectable operations, and extravagant exaggerations utilized to swell appearances and bolster up appearances beyond fair and legitimate facts.

For several years, and until a few months since, this was the only journal that attempted to furnish reports of building activities, which were depended upon monthly by the city press generally, most of whom gave due credit, including the evening journal in question, until it fell upon the idea of a *new stroke of enterprise in imitating and patterning after us*, and fixing up weekly reports.

One thing is certain, the grand flourish of $7,858,110 for the year was not derived from any original data in possession of the *Evening Bulletin*. It was borrowed capital without acknowledgment.

Yellow Pine.

IN places where wooden floorings or trimmings undergo severe or constant use the valuable Southern yellow pine has become almost indispensable. In ship work its durability has been long acknowledged, but it is only within a few years that its usefulness for house purposes has been appreciated. In former times it was tedious stuff to work by hand, but its tediousness is now overcome by improved tools and steam dressing, and the increased call for hard pine wainscotings and ceilings that have attended the active building operations of late has been readily supplied. No wooden flooring that is used bare is superior to narrow strips of Georgia yellow pine. A well-laid surface of the wood improves with age and friction; its resinous quality hardens for it a sort of natural varnish. Art, too, has recently touched this sturdy old timber. Thin door panels are sawed out of planks containing thick deposits of resin. When these panels are placed in doors that the sun can strike, the effect produced is a rich, red wine color, showing inside the room. There is a process of artificially seasoning pine. There is also one of steaming it, so that the resin will show uniformity in the board, but the naturally veined surfaces are handsome enough when properly smoothed.

The supply of this timber seems exhaustless. A large fleet of schooners and other craft is devoted exclusively to its transportation from Virginia, North and South Carolinas, Georgia and Florida. The latter State is renowned for the long boards that are cut from its trees. Georgia owns the standard of quality, but any untapped stock rates high. Trees from which the pitch has been partly removed in the manufacture of turpentine turn out lighter wood, but such cuttings have not the wearing merit of sawings from virgin trees. Since the war, owing to better railroad facilities, large tracts of new forests have been opened to commerce. Europe, especially England, is a large buyer of this wood. Its excellence in railroad work on account of toughness and comparative lightness, is becoming recognized abroad as well as in this country.

When yellow pine vessels become dismasted or capsized at sea, they form most dangerous wrecks, and at night are an especial terror to navigators. Their buoyant cargoes prevent them from sinking, and they become, so to speak, a floating reef. Several abandoned schooners have been known to drift about the ocean from six to eighteen months. Not long ago one appeared on the coast of France. Captains report these drifts to the Government. The Government in turn spreads the information, but the danger is only partly provided against, as currents or driving winds can vary the situation indefinitely.

A LITTLE girl of two and a half years burnt her finger for the first time the other day. She placed her finger on a hot potato, and suddenly drew it back, exclaiming, "O der's a pin in it!"

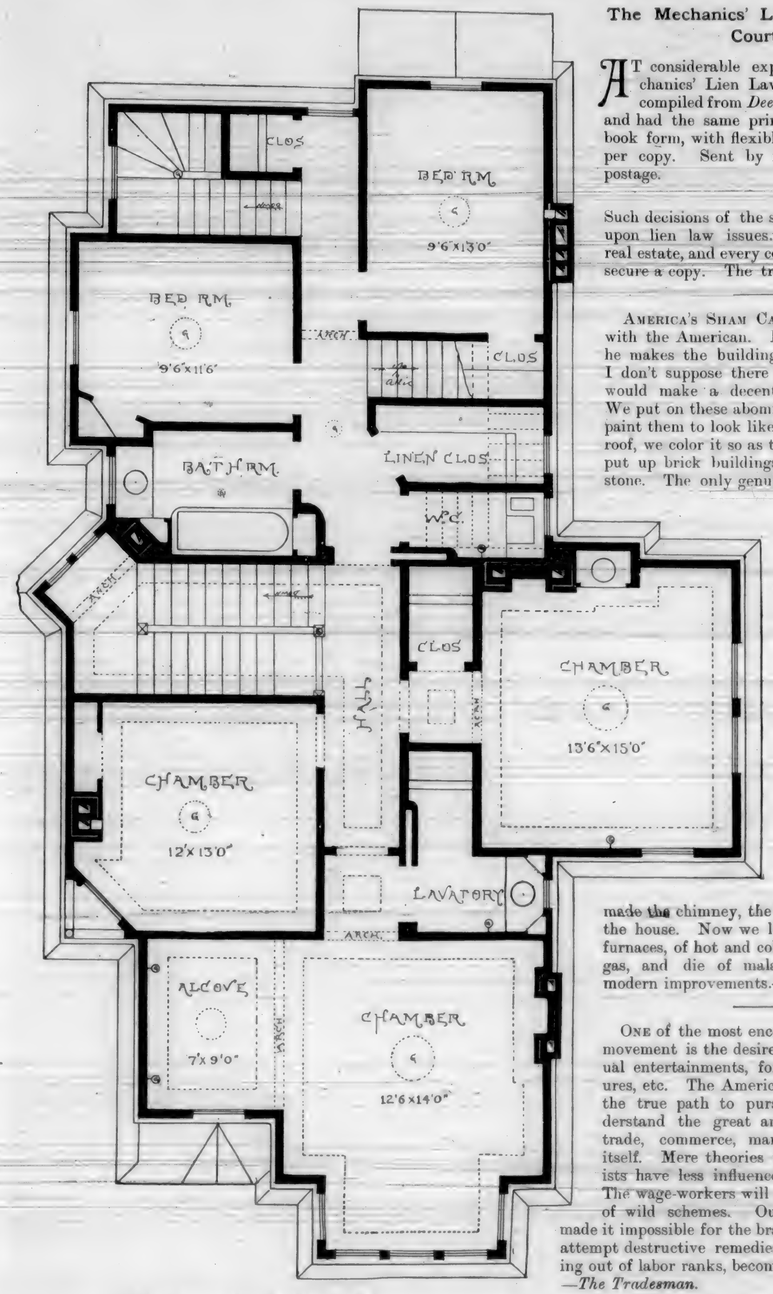

PLATE 4.—SECOND FLOOR PLAN.

THE London plumbers and gas-fitters are adopting a system of registration, for protection against incompetent workmen, who assume to do work on their own account and, by botching it, injure the reputation of the trade.

IT is stated that the Pennsylvania Railroad Company has under consideration the Frost gasoline light as a means by which to furnish illumination for its passenger coaches. The Frost light has an illuminating power equal to seventy-five candles, or nearly as much as a 6' Lungren burner.

The Mechanics' Lien Law, and Supreme Court Decision.

AT considerable expense, we have had the Mechanics' Lien Law of the State of California compiled from *Deering Code of Civil Procedure*, and had the same printed and bound in convenient book form, with flexible cloth covers; price, 50 cents per copy. Sent by mail to any address, free of postage.

ALSO,

Such decisions of the supreme court as bear directly upon lien law issues. Every architect, owner of real estate, and every contractor and workman should secure a copy. The trade supplied.

AMERICA'S SHAM CASTLES.—There is the trouble with the American. If he has $100,000 to spend, he makes the building look like a $200,000 house. I don't suppose there is a building in Detroit that would make a decent ruin. We build for show. We put on these abominable sheet-iron cornices, and paint them to look like stone. If we have a shingle roof, we color it so as to look like slate or tiles. We put up brick buildings and thinly face them with stone. The only genuine thing, as well as the only original thing about American architecture is the pioneer log-house of the backwoods. There the logs were logs with the bark on, and the roof was of clapboards split from the oak blocks, the chimney was built of clay, and stood boldly and generously out as if it were not a thing to be hidden, but the warmest and most inviting thing about a house. The floor was uncovered boards, and the blackened beams overhead stood boldly out in the grateful light of a hickory fire blazing on the huge, ample hearth. The log-house was a product of the immediate land around it. The clay dug from the well made the chimney, the logs cut in the clearing made the house. Now we live—or try to—in an age of furnaces, of hot and cold water, of shoddy and sewer gas, and die of malaria and diphtheria and all modern improvements.—*Detroit Free Press.*

ONE of the most encouraging features in the labor movement is the desire for arbitration, for intellectual entertainments, for laborers' night schools, lectures, etc. The American workingmen recognize that the true path to pursue is to know more, to understand the great and vital questions underlying trade, commerce, manufacturing and government itself. Mere theories take very little hold. Socialists have less influence than ever with the masses. The wage-workers will not be led into the adoption of wild schemes. Our public school system has made it impossible for the brain and brawn of a country to attempt destructive remedies. Men and women are arising out of labor ranks, becoming fair writers and lecturers. —*The Tradesman.*

SOME investigations made relative to the heat of combustion of stone coal have led to the conclusion by Meunier and others that during the formation of coal a certain quantity of heat must have been absorbed, since the theoretical heat of combustion was always less than that actually observed. From want of knowledge, however, as to the real constitution of coal, it is regarded as impossible to determine the nature of this absorbtion. It is also a fact that, from want of knowledge as to the composition of coal, the heat of combustion cannot be calculated. It is well known that two coals of precisely the same chemical composition may and do afford very different degrees of heat in combustion.

Child and State.

PUBLISHED by, and in the interest of, the Boys' and Girls' Aid Society of this city, contains the elevation design for the contemplated building, and many interesting facts and statements. Through the generosity of Senator Fair, the society was enabled to secure an eligible lot, and the timely gift of Mr. Crocker, of $31,000, supplies the greater part of the fund necessary to active operations.

It is hoped that before the advent of 1887 the society will not only have a "roof over its head," but a completed and fairly, if not thoroughly equipped home for hundreds, who, but for the doings of the society, might remain upon the currents of life leading to unhappiness and a bad ending.

The $4,000 from the late Mr. Sharon will still further help on the work; and pre-supposing some things not yet made known, it is fair to set down, in the list of *likely things*, considerable sums from others moved by innate nobility of soul, or by the example of the few millionaires and wealthy men who have, by their grand gifts to deeds of charity and public benefaction, reared monuments of fame, which will perish when, and not until, good deeds shall no longer be considered meritorious.

HOUSING OF THE BERLIN POPULACE.

A flood of light is let in on the singular spread of socialism in the German capital by statistics showing that in Berlin no less than 94,000 families, comprising nearly 400,000 individuals, have to live, sleep, and often work in suites of a single room. In 3,000 of these rooms there is neither stove nor fire-place. One-fourth of their tenants are poor lodgers. Twenty-five thousand families live in cellars under sanitary conditions that are characterized as absolutely shocking. Such meager accommodations as our despised New York tenements afford, with their two or three rooms to each family, are at a premium, and would be accounted a great boon by thousands. Only of the poorest and the best classes of dwellings—those renting at 10,000 reichmark a year or over—is there abundance, for the Berlin builder is a speculator, not a philanthropist. The poor have not even the chance of going to church of a Sunday, to meditate on better things to come, were they so minded; for all the Protestant churches and chapels in Berlin have together hardly seats for 50,000, while the servant girls alone number over 60,000.—*New York Tribune.*

THE BRONZE BACCHUS FROM THE TIBER.

—The chalky incrustation which covered the bronze statue lately found in the bed of the Tiber has been removed, and the admirable modeling of the statue has thus been fully revealed. It is one of the most beautiful works of the kind, and with the exception of some damage to the legs and left hand, is in a capital state of preservation. The statue, about six feet, is doubtless that of the youthful Bacchus. In the left hand is the usual staff, while the right probably held a drinking-cup, in the attitude so often seen in pictures of the god at Pompeii. The soft and feminine form, the ivy wreath on the head, the luxuriously waving hair, which is modeled in the manner of the hair of Apollo, are other proofs that the statue was meant for Bacchus. It seems to belong to the first century of the Roman Empire, when Rome was illuminated by the last rays of Greek art. The lines and surfaces of the statue in all the uninjured parts are as fresh and pure as if the work had just left the master's hand. The figure was only half buried, head downward in the bed of the river, so that the action of the water has roughened the lower parts. The eyes inserted are of ivory and give extraordinary vitality to the expression.—*London Daily News.*

SOME Pittsburg men who looked for a leak in a natural gas pipe, with a lantern, found the leak, and then went to the hospital.

Our Illustrations.

ATTENTION is directed to the illustrations given in this issue. Plates 1 and 2 represent the front and side elevation of a very comfortable private residence, suitable for either city or country. Plates 3 and 4 show the two floor plans, which sufficiently explain themselves. As will be seen, the arrangements are complete for a comfortable home, with possibilities for additional rooms and enlargement. Plates 5 and 6 are the two elevations for a convenient, moderate cost, suburban cottage. There are but few journals, even during the holiday season, which have produced illustrations of greater practical value than those in present number.

(From an address by Professor Thurston, of Cornell University.)

AT Bloomfield, New Jersey, the authorities are introducing most successfully a course of instruction of both boys and girls in the use of tools into their public school system. A manual training school affords a means of rewarding merit at Girard College, where the best students and most promising youth are admitted into the wood-working and machine shops under instruction, and there, under the careful and skillful tuition of expert mechanics, I have seen boys of twelve doing work at the vise with hammer and chisel and file that many an old workman might be glad to rival. The city of Chicago has a manual training school; at St. Louis, Washington University is doing excellent work in well-appointed shops. Boston, in her great Institute of Technology, besides the classes of aspirant mechanical engineers, has organized other classes of boys ambitious to learn the use of tools, and is cultivating the special Yankee talent in a systematic and fruitful manner; and all over the country these primary technical schools are springing up.

"A year or more ago, I received a letter from a capable and successful superintendent of schools in a Western city, saying that he had seen plainly the approach of the new era in primary education of the people for the work and life of the people, and desired to be ready for its advent in his own city, and asked to be instructed that he might intelligently direct the changes of method and system inevitably to come in his own organization.

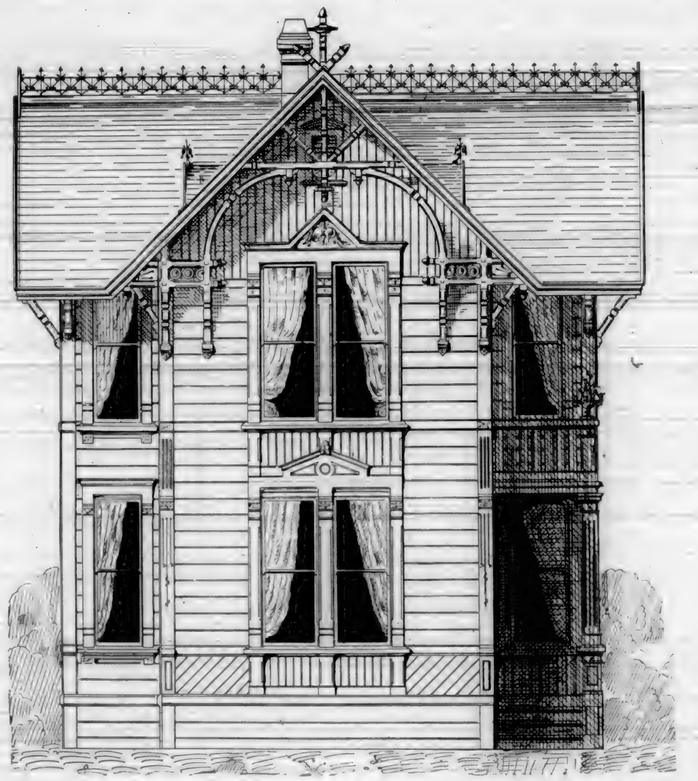

PLATE 5.

He came East and worked in the shop and studied under instructors all summer, to obtain the requisite knowledge and skill. Fortunately, he proved a natural mechanic, and an extraordinarily capable man, and he is now ready to lead in the movement when the looked-for time shall arrive.

"Trade schools now form a part of every school of engineering, and schools of engineering are springing up all over the land."

ANCIENT SANITARY LAWS.—That sanitary regulations are not wholly the invention of the present generation, is evidenced by the historical fact, which perhaps is not generally known to most people, that more than two centuries ago the father of Shakespeare was fined by the authorities of Stratford-on-Avon for depositing garbage in the street in front of his cottage.

Building Report from Woodland, Yolo County.

MESSRS. GILBERT & SON kindly furnish us the following facts relative to building improvements in that part of the State:—

"The private residences taken alone are decidedly better, and show a marked improvement over the majority of those of former years, and confidence is felt that the buildings and improvements for 1885 will compare favorably with any town of same size in Northern California in number of buildings and aggregate value.

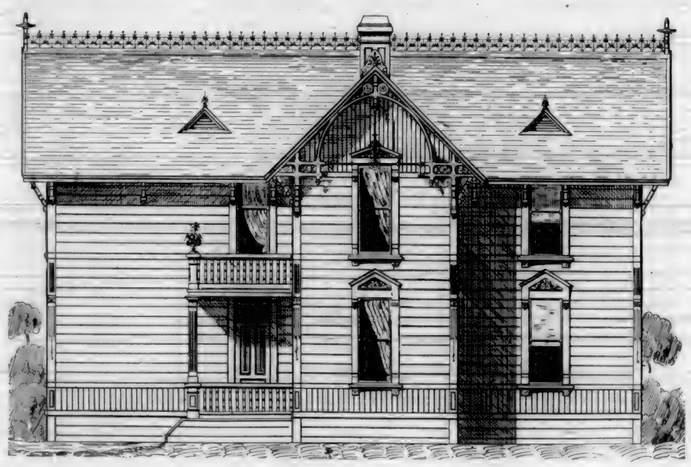

PLATE 6.

"The two months showing smallest returns were January and May—25 buildings at $34,700, and the two largest months, September and November—61 buildings at $157,375."

1885.			WOODLAND CITY.						YOLO COUNTY.				
Month.	No. per month.	FRAME BUILDINGS.		BRICK BUILDINGS.		ADDITIONS & IMPROVEM'S.		FRAME BUILD NGS.		BRICK BUILDINGS.		TOTAL VALUE PER MONTH.
		No.	Value.	No	Value.	No	Value.	No.	Value.	No.	Value.	
Jan	12	2	$ 2,200	..	$.....	4	$3,800	4	$ 5,400	2	$ 2,000	$13,400
Feb	12	3	3,100	1	1,400	3	6,300	2	3,000	3	13,000	26,800

Jne	19	13	39,100	..	.....	4	5,000	1	2,100	1	12,000	58,200
J'ly	15	10	25,100	..	.....	..	.....	3	3,600	2	10,000	38,700
Agt	12	6	33,100	..	.....	2	2,000	4	5,000	..	.....	40,100
Sep	31	20	44,800	..	.....	..	.....	9	22,275	2	15,000	82,075
Oct	27	12	21,200	2	2,500	..	.....	12	24,400	1	2,500	50,600
N'v	30	10	14,000	7	19,100	1	1,000	10	33,700	2	7,500	75,300
Dec	18	8	11,700	2	16,000	1	1,500	7	12,000	..	.....	41,200
Total	224	105	$246,500	18	$81,500	21	$26,300	67	$134,775	13	$62,000	$551,075

Total number of buildings in Woodland, 144; value, $354,300. Total number of buildings in Yolo County, 80; value, $196,775. Total number of buildings for City and County, 224. Final aggregate, $551,075.

While the preceding statement shows 224 buildings and improvements for Woodland and Yolo County, at a value of $551,075, it would be safe to add to this amount 10 per cent for engagements costing less than $1,000 (minor improvements, barns, carriage-houses, out-buildings, etc., not reported), $55,107.50, making the final value invested in 1885, $606,182.50. This presents a gain over 1884 of 91 buildings and $251,628.50 capital.

For comparison, we give a recapitulation of the annual statistics for six years, from 1880 to 1885 inclusive, presenting the number of buildings, aggregate value, average value, and largest single engagement each year:—

YEAR.	NO. OF BUILDINGS.	AGGREGATE VALUE.	AVERAGE VALUE.	LARGEST NGAGEMENT.
1880	54	$126,720	$2,346	$28,000
1881	59	140,640	2,382	34,580
1882	71	169,950	2,393	15,500
1883	84	204,519	2,434	52,000
1884	133	359,544	2,702	28,000
1885	224	606,182	2,461	25,000
Total for 6 years	625	$1,607,605	$2,448	$52,000

Woodland, twenty-five years ago, contained within present city limits one dwelling. At the present time it is one of the prettiest inland cities, with rows of brick stores and structures, churches, school houses, hotels, theater, and other evidences of modern life and prosperity, besides many fine residences and the earlier constructed buildings, and the less costly cottages of more recent construction. The future outlook is good.

TO TEMPER TOOLS.—The quality of the steel should be uniform throughout; indeed, it is always better to have them tempered rather too hard than soft, for use will reduce the temper. If at any time it is necessary to perform the operation yourself, the best method is to melt a sufficient quantity of lead to immerse the cutting part of the tool in. Having previously brightened its surface, plunge it into the melted lead for a few minutes, till it gets sufficiently hot to melt a candle, with which rub its surface; then plunge it in again, and keep it there till the steel assumes a straw color, but be careful not to let it turn blue. When that is the case, take it out, rub it again with the tallow, and let it cool. If it should be too soft, wipe the grease off, repeat the process without the tallow; and, when it is sufficiently hot, plunge it into cold spring water, or water and vinegar mixed. By a proper attention to these directions, and a little practice, every workman will have it in his power to give a proper temper to the tools he may use. If a saw is too hard, it may be tempered by the same means; but as it would be not only expensive, but in many cases impossible to do it at home, a plumber's shop is mostly at hand, where the process may be repeated when they are melting a pot of lead. But here observe that the temper necessary is different to other cutting tools; you must wait till the steel just begins to turn blue, which is a temper that will give it more elasticity, and, at the same time, sufficient hardness.

Glass Flooring.

THE substitution of glass flooring for boards continues to increase in Paris, this being especially the case in those business structures in which the cellars are used as offices. At the head-quarters of the Crédit Lyonnais, the whole of the ground is paved with large squares of roughened glass, imbedded in a strong iron frame, and in the cellars beneath there is sufficient light, even on dull days, to enable clerks to work without gas. The large central hall at the offices of the Comptoir d'Escompte has also been provided with this kind of flooring, and it is said that, although its prime cost is considerably greater than that of boards, glass is, in the long run, far cheaper, owing to its almost unlimited durability.

IF you go about telling people you have an inheritance worth a million worlds, and yet get out of temper about the loss of a nickel, they will not believe you.

MASONS' AND BUILDERS' EXCHANGE OF SAN FRANCISCO.

ROOM 11, 314 MONTGOMERY ST.

BELOW will be found a list of the members composing this Exchange. Boxes are provided for each member, so that architects, owners, or others desiring the services of any particular member, or those having boxes who are not members, and yet whose business is directly connected with that of the Exchange, can readily secure the attendance of the party sought, by leaving a note in the respective boxes.

AN EXTRAORDINARY OFFER.

WE want Live, Energetic, and Capable Agents in every county in the United States and Canada, to sell a patent article of great merit, ON ITS MERITS,—an article having a large sale, paying over 100 per cent profit, having no competition, and on which the agent is protected in the exclusive sale by a deed given for each and every county he may secure from us. With all these advantages to our agents, and the fact that it is an article that can be sold to every house owner, it might not be necessary to make an "EXTRAORDINARY OFFER" to secure good agents at once, but we have concluded to make it to show, not only our confidence in the merits of our invention, but in its salability by any agent that will handle it with energy. Our agents now at work are making from $150 to $600 a month clear, and this fact makes it safe for us to make our offer to all who are out of employment. Any agent that will give our business a thirty days' trial, and fail to clear at least $100 in this time, ABOVE ALL EXPENSES, can return all goods unsold to us, and we will refund the money paid for them. Any agent or general agent who would like ten or more counties and work them through sub-agents for ninety days, and fail to clear at least $750, ABOVE ALL EXPENSES, can return all unsold and get their money back. No other employer of agents ever dared to make such offers, nor would we if we did not know that we have agents now making more than double the amount we guaranteed; and but two sales a day would give a profit of over $125 a month, and that one of our agents took eighteen orders in one day. Our large descriptive circulars explain our offer fully, and these we wish to send to every one out of employment who will send us three one-cent stamps for postage. Send at once and secure the agency in time for the boom, and go to work on the terms named in our extraordinary offer. We would like to have the address of all the agents, sewing machine solicitors, and carpenters in the country, and ask any reader of this paper who reads this offer, to send us at once the name and address of all such they know. Address at once, or you will lose the best chance ever offered to those out of employment to make money.

RENNER MANUFACTURING CO.,
116 Smithfield St., Pittsburg, Pa.

Market Reports.

Hereafter we will give, as far as practicable, the Market Report (monthly) in the following manner:—

LUMBER—Nothing doing in cargo lots, and prices for same are $1 50 to $2 below the following rates, which are for retail lots:

Rough Pine, merchantable	per M feet,	$14 00
" " No. 2	" "	11 00
" Redwood, No. 1	" "	17 00
" " No. 2	" "	13 00
1x6 T. & G. No. 1 Pine	" "	26 00
" " " No. 2 Pine	" "	21 00
1x4 and 1¼x4x6 T. & G. No. 1 Pine	" "	28 00
" " " No. 2 Pine	" "	23 00
Stepping, Pine	" "	37 50
Surface Redwood, No. 1	" "	30 00
1x4 T. & G. Redwood, 12 ft. and over	" "	28 00
1x6 " " " " "	" "	25 00
1x4 and 6 T. & G. Redwood, No. 2	" "	20 00
Siding, ½ inch	" "	22 50
Fancy Pickets	per M,	25 00
Rough "	"	15 00
Rough Square	"	14 00
Shingles	"	2 00
Laths	"	3 25
Battens, ½x3	per lineal foot,	¾ ct.

NAILS—Rates were recently reduced to:—

20 keg lots	$3 15
100 keg lots	3 20
Smaller quantities	3 25

(The reduction in above rates is caused by Eastern factories unloading again on this market.)

PAINTS AND OILS:—

Pioneer White Lead (local factory)	6c @ 6½
Cal. Linseed Oil, raw (single bbl lots)	45
" " " boiled " " "	47½
Turpentine, per gallon	50

(There is a lively competition between Eastern Linseed and Home Manufactures.)

BRICK—California Building Description, soft, per 1,000 ..... $6 50
" " " red, " " 7 50
" " " hard, " " 8 50

Building Intelligence.

Where owners' names are left blank, it is so done in most instances by special request.

B

Brush, bet. Montgomery and Sansome. Five-story and basement brick.
O.—Charles Crocker.
A.—Edward R. Swain.
Total of contracts awarded for brick, carpenter, iron, granite, stone, steel, beam and vault work amounts to $180,000. Painting, plumbing, plastering, and other portions of the work not yet let.

Broderick, cor. Water. Three two-story frames.
O.—G. B. Beale.
A.—Townsend & Wyneken
C.—H. B. Hosmer.
$13,500.

Broadway, nr. Leavenworth. Alteration.
O.—H. Mahoney.
C.—M. Murray.
$1,500.

Brannan Place, Green, bet. Dupont and Stockton. Three-story frame.
O.—Joe Vacarro.
Day work.
$5,000.

Bay, NE cor. Dupont. Factory.
O.—J. Mayer.
A.—H. D. Mitchell.
C.—W. E. Wellbye.
$10,000.

C

California, bet. Larkin and Polk. Three-story pressed brick.
O.—H. Campbell.
C.—W. B. Bradbury.
$25,000.

Clay, cor Franklin. Two-story frame.
O.—P. N. Lilienthal.
A.—Pissis & Moore.
$30,000.

Church, corner Dorland. Two-story frame.
O.—C. B. Williams.
A.—C. Geddes.
C.—J. Wilson.
$5,500.

Chattanooga, bet. Twenty-second and Twenty-third. Four one-story frames.
O.—J. Bolger.
A.—Huerne & Everett.
C.—Doyle & Son.
$6,100.

California, above Montgomery. Additions and alterations.
O.—Spring Valley Water Works Co. J. Schussler, sup't of building.
Day work.
$5,000.

Clipper, corner Church. Two-story frame.
O.—H. Bernhardt.
A.—J. Hoffman.
C.—A. Klahn.
$8,500.

D

Devisadero, nr. Page. One-story frame.
O.—Miss E. O. Darrow.
C.—H. Darrow.
$800.

Dupont, bet. California and Sacramento. Additions and alterations.
O.—Joe Goetz.
A.—T. J. Welch.
C.—J. L. Binet.
$5,000.

Dolores, bet. Duncan and Twenty-eighth. Frame church.
O.—German Methodist Episcopal Church.
C.—A. Klahn.
$1,000.

Dorland, nr. Seventeenth. Two one-story frames.
O. C. Coulson.
C.—G. M. Salisbury.
$2,000.

E

Eddy, nr Mason. Additions and alterations.
O.—C. H. Twombly.
C.—C. M. McDonald.
$5,000.

Eddy, nr. Devisadero. Two-story frame.
O. and B.—F. Buckley.
A.—Huerne & Everett.
$2,000.

Ellis, nr. Gough. Two-story frame.
O.—M. Foley.
A.—T. J. Welch.
C.—Emgerson & Gore.
$5,500.

F

Fair Oaks, bet. Twenty-fourth and Twenty-fifth. Three-story frame.
O. and B.—J. L. Binet.
Day work.
$5,000.

Franklin, cor Golden Gate ave. Three-story frame.
O.—J. A. Borgerot.
A.—W. A. Bayless.
C.—J. A. Leonard.
$10,000.

Fulton, bet. Franklin and Gough. Three-story brick, United States Brewery.
O.—F. Keonenberg & Co.
A.—H. Geilfuss.
C.—Bulk work, T. Haaf; carpenter, W. Pluns.
$80,000.

G

Geary, nr. Octavia. Two-story frame.
O.—A. M. Goldsmith.
A.—J. Marquis.
C.—H. Tibbets.
$7,500.

Green, bet. Kearny and Dupont. Additions.
O.—J. Picceroni.
C.—J. Foster.
$1,200.

Gough, cor. Post. Two-story frame.
O.—Mrs. J. V. Elvert.
A.—Kennitzer & Raun.
C.—F. Klatt.
$6,500.

H

Hyde, bet. Greenwich and Lombard. Two-story frame.
O.—Mrs. Libby.
A.—Townsend & Wyneken.
Day work.
$800.

Haight, near Broderick. Two-story frame.
O.—M. Riley.
A.—J. J. Clark.
C.—J. W. Smith.
$3,000.

Hampshire, nr. Twenty-first. One and one-half story frame.
O.—W. Coons.
A.—J. B. Williams.
$1,800.

Howard, bet. Thirteenth and Fourteenth. One and one-half story frame.
O.—J. O'Connor.
A.—M. J. Welch.
C.—M. D. Creman.
$1,900.

Howard, bet. Thirteenth and Fourteenth. Two-story frame.
O.—Maria Quinn.
A.—S. and J. C. Newsom.
C.—D. B. Spangler.
$2,250.

Haight, nr. Broderick. Two-story frame.
O.—M. Riley.
A.—J. J. Clark.
C.—J. W. Smith.
$7,500.

Hyde, bet. Sacramento and Clay. Two-story frame.
O.—M. Wunch.
A.—Kennitzer & Raun.
C.—H. Meyne.
$7,500.

J

Jackson, nr. Van Ness. Two-story frame.
O.—Eliza R. Dingerfeld.
A.—Percy & Hamilton.
C.—B. F. Ellis.
$2,000.

Jackson, cor. Van Ness. Two-story frame.
O.—S. Tanen.
A.—Percy & Hamilton.
C.—B. F. Ellis.
$6,000.

Jackson, nr. Van Ness. Two-story frame.
O.—Mrs. E. Daningfield.
A.—Percy & Hamilton.
C.—B. F. Ellis.
$2,000.

L

Lombard, nr. Jones. Two-story frame.
O. and B.—J. P. Hunter.
Day work.
$3,500.

M

Mission, bet. Fifth and Sixth. Repairs.
O.—J. W. Brown.
Day work.
$2,500.

McAllister, cor. Franklin. One-story frame.
O.—B. Williams.
A.—H. Geilfuss.
C.—J. Fuchs.
$1,700.

Market, nr. Fifth, south side. Additions and alterations.
O.—J. McCauley.
Day work.
$3,000.

Mason, cor. Guerrero. Two-story frame.
O.—Sarah B. Farackerley
A.—M. J. Welch.
C.—C. Buckley.
$2,800.

Montgomery Avenue, junction Stockton. Two-story frame.
O.—
C.—A. Alexander.
$2,500.

N

Nineteenth, cor. Lapidge. Two-story frame.
O.—J. Thompson.
A.—T. J. Welch.
C.—J. Blake.
$6,500.

O

O'Farrell, cor. Gough. Two-story frame.
O.—I. Selig.
A.—J. Marquis.
C.—R. Parker.
$14,000.

Oak, bet. Scott and Devisadero. Two-story frame.
O.—P. Duffy.
Day work.
$2,500.

Oak, bet. Devisadero and Broderick. Two-story frame.
O.—N. Schlessinger.
A.—M. Donnall & Son.
C.—J. A. Leonard.
$4,800.

Oak, bet. Scott and Devisadero. Additions.
O.—and B.—J. Weigner.
Day work.
$1,500.

P

Pine, nr. Broderick. Two-story frame.
O. and B.—W. F. Lewis.
Day work.
$3,700.

Polk, bet. Fulton and Grove. Two-story frame.
O.—B. Bowman.
A.—T. J. Welch.
C.—J. Blake.
$4,500.

Polk, nr O'Farrell. Three story frame.
O.—H. Slessinger.
A.—P. R. Schmidt.
C.—H. Keenan.
$8,000.

Pine, nr. Stockton. Additions.
O.—Miss Prine.
C.—S. M. Hills.
$2,000.

Pine, nr. Larkin. Additions.
O.—Chicago Brewery Co.
Day work.
$30,000.

Pine, nr. Devisadero. Two-story frame.
O.—Mrs. Myrick.
A.—T. J. Welch.
C.—A. McElroy.
$8,500.

S

Seventeenth, bet. Noe and Sanchez. One-story frame.
O. and B.—L. Sauer.
A.—Salfield & John.
$2,000.

Sacramento, cor. Baldwin. Two three-story frames.
O. and B.—Thomas Holt.
Day work.
$8,000.

Sutter, bet. Scott and Devisadero. Two-story frame.
O. and B.—James Geary.
Day work.
$3,000.

Seventeenth, nr. Collins wood. One-story frame.
O.—W. Thomas.
Day work.
$1,500.

Seventeenth, nr. Noe. One-story frame.
O. and B.—A. Sauer.
Day work.
$1,700.

Seventeenth, nr. Noe. One-story frame.
O.—
C.—F. Bohnenberg.
$2,000.

Stevenson, near Nineteenth. Additions.
O.—H. Walsh.
C.—J. W. Powers.
$1,800

Second, near Frederick. One-story frame.
O.—N. Treadwell.
C.—B. Treadwell.
$1,200.

Shotwell, cor. Twenty-sixth. One-story frame.
O. and B.—C. O. Smith.
Day work.
$2,000.

Shotwell, near Twenty-sixth. One-story frame.
O.—A. Wadwell.
C.—McCormack & Elam.
$1,500.

T

Twenty-first, cor. Guerrero. Alterations.
O.—E. G. Denningston.
A.—Percy & Hamilton.
C.—B. F. Ellis.
$2,000.

Twenty-sixth, cor. Treat ave. One-story frame.
O.—W. Halpin.
Day work.
$1,000.

Twenty-third, nr. Bartlett. Additions.
O.—H. Fitzgerald.
Day work.
$800.

Twentieth, bet. Valencia and Guerrero. One and one-half-story frame.
O.—F. Mettmann.
C.—F. C. Kleebauer.
$2,000.

V

Van Ness Avenue, cor. O'Farrell. Work on the Roman Catholic Cathedral has been commenced. Contract to the amount of $12,000 has been let to O. E. Brady for grading and fence work.

Vincent, cor. Green. Two-story frame.
O.—C. Munsanti.
Day work.
$2,300.

Valencia, cor. Twenty-first. Three-story frame.
O.—J. T. Poheim.
A.—B. E. Henriksen.
C.—Moore Bros.
$21,500.

"NONE SUCH"
CHIMNEY TOP AND VENTILATOR

THIS VENTILATOR is especially valuable for regulating draft (upwards and downwards) made by the light, unstable atmosphere of the Coast Range of Mountains. The hundreds of tall stovepipes erected on the chimney tops of houses indicate inconvenience and trouble in the kitchen, the parlor, and chambers below.

SAN FRANCISCO, October 26, 1885.

To whom it may concern:

I take pleasure in stating that the "None Such" Chimney Top and Ventilator, which was put upon the smoke-stack of the Baldwin Hotel about two months ago, has given complete satisfaction.

It has increased the draft to such an extent that there is a perceptible saving in the amount of coal consumed; smaller fires than heretofore will now answer to keep up the steam, thus causing a great saving of the boiler also. We have heretofore had much difficulty in keeping up the amount of steam steadily required, owing to the lack of draft, all of which is now remedied by the use of the "None Such" Chimney Top and Ventilator. I heartily recommend its use to all persons, where a strong draft is required.

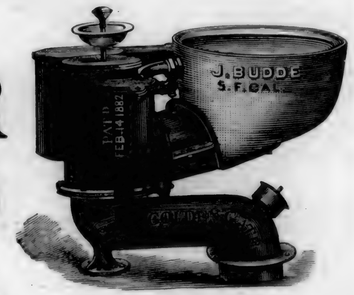
JOSEPH BUDDE'S

PATENT WATER CLOSETS

WITH TRAP.



WITH OFFSET.

The Golden Gate Plug Closet.

This Closet is the best of its kind, having been so far constructed, it has the following advantages:—

1. It has a simple, strong valve, suitable for any pressure.

2. It has a real sanitary overflow, a copper float attached to a bell of the same metal resting on face of the brass overflow pipe, operated by the rising of the water in the closets above its level, thus absolutely preventing any escape of sewer gas, even the closets being without water.

3. It has no dead corner, consequently no foul water will be left in the closet after the lifting of the handle. A constant rush out of the flood chambers will keep the closet and trap perfectly clean.

This Closet takes the lead; it has been sold since February, 1885, in large quantities to the best satisfaction.

THE COMBINATION HOPPER.

This hopper is constructed to take 2 2-inch pipes, one to the right and one to the left and a 4-inch leader in the center. It has also a movable strainer on top to take the surface water. The lower part of the hopper with side outlet is to be connected with the sewer pipe, either right or left. The upper part is independent from the lower, and is made to swivel, therefore it will suit either position of pipe. This hopper can be used only for surface, for waste, or for leader; either inlet will be stopped up with iron caps if so desired.

Side View, Combination Hopper.

PACIFIC PAN CLOSET.

This Closet is superior to all others, every working part and bolt being made of brass, closet and valve extra heavy casting. Particular attention is called to No. 4. This Closet has an oval basin fastened to the cover by brass clamps and bolts. No breaking of putty joints required to renew a pan. The loosening of two large brass nuts will separate cover with basin from the receiver. It has a heavy nickel plated cup and pull and solid brass rod.

These Closets have been in use since February, 1883. Plumbers and wholesale dealers give them the best recommendation.

No. 4.

Square Slop Hopper. Square Waste Hopper. Basket Hopper.

Basket Hoppers are made in one piece with Movable Strainer.

No. 43 FREMONT STREET, ...SAN FRANCISCO, CAL.

The California Architect and Building News.

VOLUME VII. ENTERED AT POST-OFFICE, SAN FRANCISCO, AS SECOND-CLASS MAIL MATTER. ESTABLISHED JANUARY, 1879. NUMBER 2.

THE

California Architect & Building News.

A MONTHLY JOURNAL,

Devoted to Architecture, Decorating, and Furnishing.

PRICE, $2.00 PER ANNUM.

The official organ of the Pacific Coast Association of Architects. Published by the SAN FRANCISCO ARCHITECTURAL PUBLISHING CO. No. 240 MONTGOMERY STREET, Rooms 11, 12, 13.

Congratulations and Compliments.

THESE have come to us freely, from all quarters, since the January issue of this journal, for which we return hearty thanks. The improvements made have met with universal admiration and favor, and if dollars equal in number to the words of compliment expressed had been received, our exchequer would have become plethoric, and tax bills on ten million dollars' worth of real estate been items of small moment. This is gratifying, and we trust that action—*the prompt payment of subscriptions*—will express more substantially and practically, if not louder than words, the genuine sympathy of thousands for the success of this—California's first and only class journal published in the interest of architectural and building sciences.

Building Prospects.

THE total results, as shown by the following totals, would indicate unfavorably as against February, 1886. But it must be borne in mind that the present season has been extraordinarily unpropitious for building operations, while in 1885, the early months were altogether favorable. Otherwise, nothing appears to change the probable results as stated in our last issue. The continuous rains and storms have been a great drawback to active operations.

SUMMARY FOR CURRENT MONTH.

56 Frame buildings, at total cost of	$258,297
3 Brick buildings, at total cost of	93,000
13 Alterations and additions, at total cost of	25,900
72 Total for February, 1886	$377,197

FOR SAME MONTH IN 1885.

121 Buildings, at a total cost of	$660,397
Present month	377,197
February, 1886, less than February, 1885	$283,200

Notwithstanding this odds against present month, architects report a large number of plans in preparation, and prospects good.

The purpose of the reports in this journal is to give as nearly as possible the exact state of facts, whether stimulating or depressing, leaving it to the good sense and judgment of our readers to draw their own conclusions. We shall at no time seek to follow the example of journals who attempt to collate building facts, and for the sake of appearances, and to make large showing at any hazards, parade figures that do not represent facts. We claim, and know that the building reports appearing in this journal are more nearly correct than any other, and more reliable.

Our Promise Redeemed.

THE patrons of this journal were promised enlargement and improvement. As to how well this promise has been observed and fulfilled, it is only necessary to refer to the present, as compared with former issues. In typography, illustrations, matter, general make-up and appearances, the changes speak for themselves; and considering the great disadvantages we labor under, of limitedness of local field and facilities, distance from the densely populated sections, where teeming life and business is in perpetual flow from State to State, and from city to city, and innumerable facilities and advantages surround our Eastern contemporaries, our present claim to comparative excellence with the best class journals published in same interests, will meet the approval of all who review the situation.

OTHER IMPROVEMENTS WILL FOLLOW.

Changes and improvements are always attended with greater or less cost and expense, and as in the present instance in this journal, large outlay; but these become immaterial considerations, when

THE SUSTAINING HAND OF PATRONAGE

Is freely extended. And to us, a grand success of this pioneer California journalistic enterprise is more desired than the money profits returned from its publication.

LET IT BE HEARTILY SUSTAINED

By large increase in both its subscription and advertising patronage. The terms and rates are within reach of all, and none should fail to add their mite.

Architects, contractors, owners, mechanics, artisans, material men, house furnishers and decorators, and all interested in building pursuits, should realize that a journal of this kind and character is an essential and important auxiliary and medium of thought and practical information, and, as such, should meet a warm and hearty subscription indorsement.

Profits on $30,744,861—Building Contracts.

IT is always fair and reasonable to presume in business transactions, where large sums of money change hands, and the conditions surrounding operations are animated and active, that the average results would show fair gains and profits to the operators. This proposition is applicable in all cases, and specially so to the building trades of the Pacific Coast during the past six years.

From 1880 to 1885, inclusive, the amount of money known to have been expended in building-improvements in San Francisco, alone, amounts to $27,949,874, and allowing that the unreported transactions would add ten per cent to the sum stated, the total amount changing hand among contractors, material men, subcontractors and others, would reach $30,744,861. Had this large expenditure yielded the moderate profit of *ten per cent*, the aggregate of earnings to those engaged in the *erection* of buildings alone would have been $3,074,486, a sum sufficient to have shown itself conspicuously in many individual cases, over and above ordinary, personal, and family expenses.

This sum of $30,744,861 has all passed through the hands of *original contractors* in the various branches of building constructions, exclusive of the cost of lots, lands, furniture, fixture, and numerous decoration, ornamentation and other expenditures. It is fair to judge and measure the magnitude of business successes in cities and communities, by the results developed among those engaged in general or special enterprises and operations. If many millions of dollars change hands, as in the matter under review, and those who have handled the money have but little or nothing to show at the ending of transactions as profits, the inference is fair that bad judgment, reckless venture or incompetency has ruled; while on the other hand, if wise and prudent conception of values, and good management have prevailed, general appearances will clearly indicate, in various ways, that the active participants have done well. Advantageous and profitable transactions enrich and add to community as well as individual wealth; while undertakings with no more than bare living profits in them, added to the frequent cases entailing actual loss, humiliates, demoralizes, and empoverishes.

All this is applicable in the matter under discussion, and the facts of the case serve to show that the parties engaged in the various building pursuits, have enjoyed splendid opportunities, during the past six years, to improve and advance their financial condition; and if the business was one of fair average profits as a rule, the results naturally manifesting themselves would sustain the presumption that the laborer has reaped the value of his hire. That some few have done well is unquestionably true, and deplorable indeed would it be, if among the host of contractors in San Francisco there were none sufficiently wise, prudent, competent, and intelligent to handle their business with profit to themselves. But the much greater proportion have but little to show as accumulations of profits from the undertakings of the period named, and safe to say, a very large proportion—reasonably stated—fully one half of the whole number, have barely subsisted, *i. e.*, paid their way, living moderately, but with nothing left to show as gains and profits for time, labor and skill employed and expended; while very many who have rated themselves competent contractors, especially in the carpenter's department, have made sad havoc of most or all their hands have touched,—living upon moneys belonging to their creditors, extracted from the payments handled during progress of operations, and piled up, loss upon loss, to very large amounts, ending in pro ratio settlements ranging from ninety-five, fifty, forty, twenty, ten, and sometimes not one farthing per cent.

The irresistible conclusion from this condition of things is, that fools still live, and, unfortunately for the intelligent classes of contractors, there is no law under which they can be estopped plying their stupid follies. For a man who estimates and agrees to perform and furnish material and labor for one dollar, which is reasonably worth and will cost a dollar and two, five, ten, or twenty cents, is a fool without qualification, or a dishonest creature, who should be dealt with as rogues of other kinds are. But the point sought to be maintained is this: that, while a very large sum of money has flowed in building channels, the profits, if averaged among first contractors as a whole, would be far below any business standard of fairness; and the man who would assume the risk of balancing accounts between the losses and gains of the business for the six years mentioned, with the actual total balance to the credit of the $3,074,486, would need no very large money-bag to carry the sum of difference in gold coin. If the shortages could be ascertained, and were deducted from the gains, the balance would be small indeed in favor of the latter.

A very limited number of contractors, as compared with the whole, might be named as being well fixed; not rich, but in a fair way to reach a point where contracting will lose its charms, and that ease and luxury of financial competency be enjoyed which enables one to choose his comforts outside the vexations of business care and anxieties. But, of these few, while they have done well in their contracting ventures, their accumulations are more the result of investment in property and speculation, and special business advantages, than from the margins on contracts. Aside from these more favored ones, the examples of success average exceedingly small, and sustain, beyond question, the fact, that, *with the exceptions out*, the profits on house-building contracts have been far, very far, less than they should have been, the amount of money involved, considered; not averaging two per cent, and quite as likely the percentage being on the loss side; this most assuredly is true, if the few engagements that have paid—say ten in each one hundred of the whole number—be withdrawn. "Fat" contracts are occasionally, but rarely obtained; but for each one such, there are fifty that are exceedingly lean, and scores with neither fat, flesh, nor marrow in them, and creditors at completion have to content themselves with the pickings from dry bones—pro ratio settlements.

Allusion to contractors in this connection could not be avoided, as they are the mirrors through which the points in argument are reflected; for it is an indisputable fact that the parties engaged in any pursuit reflect the conditions and results of action, in their mode, style, and manner of living; in their investments, personal expenditures, and otherwise. By these the approximate magnitude of earnings and resources may be estimated, and appraisement placed upon the profitables of transactions. Accepting and applying this as a maxim of judgment, it must be admitted that not even the most successful and prosperous of the contractors in San Francisco are extravagant spendthrifts and high livers, nor those who have done fairly well and maintain good standing and credit; but to the contrary, as a rule, they are men of moderate display and economical habits; while hundreds who have misdevoted their time and personal energies to contracting, have neither a roof over their heads, nor a foot of ground to call their own. All these things considered, and the facts and comparisons applied, the proofs are irresistible that the building-contracting business has been one of exceedingly small average profit to contractors, and of large gains to owners in securing the erection of buildings at nominal prices, or no excess over actual cost of labor and material.

Master Painters' Association.

REGULAR meeting held 5th inst. E. M. Gallagher, President, presiding; J. A. Donovan, Secretary *pro tem.* Committee to confer with architects reported progress. L. Dwyer proposed, and Samuel Hurdis elected unanimously to membership; E. M. Gallagher elected President, and Thos. Downing, of San Francisco, and J. A. Wiswell, of Alameda, Vice-presidents; election of Secretary laid over until next meeting; B. L. Brandt re-elected Treasurer, and M. J. Donovan, Sergeant-at-arms.

The following members compose the Executive Committee for ensuing term: C. A. Bernard, J. S. Mellon, J. F. Sullivan, J. A. Donovan, and H. White, of San Francisco; and F. M. Farwell and P. W. Keiss, of Alameda County, with the President and Secretary as members *ex officio*.

Mr. J. F. Sullivan offered the following:—

Whereas, It has become necessary on the part of the Master Painters of the Pacific Coast, to protect themselves against the innovations and abuses which have been imposed upon the painting art, by the acts, methods, and customs of men not actuated by a high and honorable sense of right and duty to themselves nor their clients; therefore,

Resolved, That no member of the Master Painters' Association of the Pacific Coast will employ any one who, as journeyman painter, shall, from and after the present time, work for those who use admixtures commonly known as "slumgullion" or "dope," instead of pure paint stock, thereby abusing the confidence of architects and owners, and bringing disrepute upon the painters' art; for it is a well-known fact that the misdeeds of individuals operate to the disadvantage of all engaged in the business.

Respectfully submitted,

J. F. Sullivan.

Under the order of communications, the above resolution was adopted. Thanks, by rising vote, was tendered the President, for official competency and impartiality.

The first case of reference by architects.

The Committees of Measures and Values were called upon for the first time since their appointment, to examine and report upon a case of unsatisfactory painting, and reported as follows:

We, the undersigned Committee of the Master Painters' Association of the Pacific Coast, at the request of Messrs. Curlett & Cuthbertson, architects, have examined the painting work of a building on Sixth Street, bet. Broadway and Franklin Streets, Oakland, Alameda County, and find the same not in accordance with the specifications. Approved,

E. M. Gallagher, *President*,
J. A. Wiswell,
F. T. Hall,
J. F. Sullivan,
H. G. Jarmin,
A. Wason,
J. A Donovan,
M. J. Donovan,
Committee.

A curious argument is advanced that the burglar, so far from being a curse, is a blessing to society. It is argued that the fact of his existence gives employment to many men as detectives, and that artisans and inventors are constantly employed in devising means of circumventing him.

The Growth of San Francisco.

IN the July number of this journal, 1879, the following article appeared. The hue and cry then was that the building business was overdone, and the loss of rentals predicted for all those then venturing to invest money in the further improvement of real estate. The caption and substance of the article read:—

"too many idle houses."

"This is the old stereotyped expression among many owners in discussing the feasibility of improving their real estate. Every 'to let' sign noticed by them, becomes a scarecrow, and hundreds of building lots lie idle from year to year, which, if *properly* improved would produce uninterrupted income from rentals. If it is a fact that the total number of vacant tenements is large, that fact is no argument against the building of more houses in desirable locations. All facts should be considered in determining results or averages in all cases, and when the above argument is used, to it should be added—'but a large proportion of the unoccupied places are old, ill-contrived, inconvenient and undesirable places.' And the reason why many new buildings remain untenanted, is because they too are illy planned, are destitute of necessary conveniences, are badly located, with equally undesirable surroundings, etc. Of good, convenient, well-equipped houses, there are but few in San Francisco unrented to-day. If owners commit or permit errors in the planning and erection of buildings on their property, the mistake is their own, and they should not cry out, 'Too many houses to rent,' because their own are defective and undesirable They should take the blame home to themselves, and charge the non-renting to errors of their own mistaken judgment."

This was six and one-half years ago. Then, as now, the croakers declaimed and prophesied, predicting depreciation in both improved property and rentals; they said that men who, under the conditions then existing, would tie up their coin in the further improvement of their land, would play the part of simpletons, and fix for themselves sources of regret and loss; that the tenement market was overstocked with more houses on hand than sufficient to supply demand for years to come. But then, as now, there were those who heeded not the wail of discouragement, nor listened to the words of the would-be wise; but, relying upon their own more advanced ideas and better judgments, they chose to be guided by the signs of promise that omened better things, and pointed to that which has followed. Since then all of

7,000 building improvements

Have been made in San Francisco alone, and hundreds of owners are reaping the benefits resultant from a right conception of the then prospective needs and requirements, and the near future demand for more buildings. And although the voice of the croaker has been more or less continuously heard, from then until now, and still daily vexes the ears of those who have faith in the future of our great city, and the princely State of the Pacific Coast—California—the great building interests of this city falter not, as if, in addition to the growing wealth and the wholesome and promising condition of business, and matters and things generally, some powerful, irresistible hand or force of destiny was influencing, impelling and directing the minds of the whole people to permanent investment in houses, lands, and realties.

are more houses needed?

Some will answer, No. So it has been said every year during the past twenty-five, and every day of that quarter of a century. But experience proves the fact that, excepting the period made dark and gloomy by the horrors of sand-lot-ism in its day of prowess and glory, there has been no time when tenement property was a drug in the market; and judging from all the signs of the times, past, present, and prospective, building may go on as it has done during the recent past years, and 1890 will find, perhaps, ten thousand houses added to the present number in San Francisco, with demand equal to supply, and proportionately no more "to let" signs out than there are to-day.

The Sugar Pine of California

IN every practical sense and working quality it is equal to the white pine of the Eastern States—Susquehanna, Albany, etc., with the if's herein noticed. It derives its name from the sugar-like substance that exudes to its surface upon exposure. It also contains considerable pitch and gum, which is the *if* referred to, inasmuch as their presence is somewhat detrimental, in that they cause shrinkage, and the pitch, unless held back by shellac or similar preparations, will force its way to the surface, through any number of coats of paint, and in special pieces containing an excessive quantity of the resinous matter, it is almost impossible to prevent blistering. This works bad when china gloss finishes, or grained or polished work is instituted.

fresh water seasoning

Is all that is required to make this product of the forests of California equal to any white pine produced in the United States. We have demonstrated this fact, and state it from personal experience. The more thorough and continuous, within reason, the water seasoning is to each separate piece, the more complete will be its effect in the removal of the superfluous, natural components of the wood. Rafting and soaking in fresh water and transporting the rafts down rivers and streams to tide water, is about the best that can be done when the fresh water sources are available; but in California this auxiliary to seasoning is not possible. Our sugar pine grows inland, and is conveyed to market by teams or rail, or shipped on small vessels at certain points. Were it even possible to float it in the Sacramento or other fresh water rivers, there would be thirty miles of ocean salt water to cross, and the strong ebb and flow of the tide of San Francisco Bay to encounter, before it could reach the market in this city. But even such rafting and floating, while it would improve the lumber to a considerable extent, would not wholly remedy the difficulty, for the reason that the large quantity of gum and sap in it can only be entirely removed by thorough soaking and friction. The bath process would nullify but not wholly dissipate the objectionable substance—still the benefit that any application of fresh water would be to sugar pine, would be worth all it would cost, where sugar pine is used for specially fine work or finishes. Reduced to its possible condition, the sugar pine of California would rank high among the white pines of the world.

Size of Rooms and Halls—Width of Carpets.

EDITOR California Architect: I wish the architects, builders, or whoever is responsible for the size of rooms and halls in the average house, had to buy and fit the carpets. If so, I am sure they would soon learn a very useful lesson; a lesson they should all know and practice, that is to make rooms the right size for carpets. Let me illustrate what I mean. It has been my fortune or misfortune to occupy many rented houses.

One on S Street, with four carpeted rooms downstairs and the same up-stairs; every one of these rooms was 12 feet, 4 inches wide. In length they varied, but five of them were from four to six inches too long for even widths of carpet. The hall was 56 inches wide. To carpet this house cost at least from $20 to $30 more than if the builder had given a thought to the fact that carpets are always 27 or 36 inches wide. The hall was eight yards long; so, you see, it took 24 yards to carpet it. At least that is what I had to pay for, when, if the hall had been 54 instead of 56 inches wide, 16 yards would have done. Two inches taken off the hall would have saved a great deal of bother, besides from $5 to $20 on every new carpet, and in no way marred the usefulness or beauty of the hall, and the same with the other rooms. Had the parlors been made 5 inches wider, and the other rooms that much smaller, all would have been improved, as the parlors would have been 4¼ yards wide, and the other rooms 4 yards, less one inch. It is easy to cut off or turn under a few inches of carpet, but expensive and bothersome to add that much. Even where a room is one inch too wide for a carpet, it is very annoying and expensive. In most cases a moment's thought on the part of the architect would remedy these defects, at least I regard them as defects, and quite expensive defects too. Take a room 4 by 5 yards, and even 20 square yards covers it. But suppose this room 4 yards and 3 inches, by 5 yards and 3 inches, and your carpet of a large and showy pattern, and from 25 to 30 yards are required. As Brussels carpets are most used, and Ingrains are more easily patched, the principal rooms should be made to fit the even sizes of Brussels. You have nice double parlors, and you choose a nice Brussels and find your center width just one or two inches too narrow to meet your borders, and even one inch compels awkward patching and perhaps from $20 to $50 extra expense. This cannot in all cases be avoided, but in the vast majority of cases, rooms and halls can be made the right size for carpets, and ought to be.

Another point—try to fit a carpet around a door casing with heavy moulding, and you have to cut and fold and twist, and then you leave an unsightly, dust-catching corner, as you cannot make the carpet fit neatly around such mouldings. Now, Mr. Architect and Carpenter, let a woman give you a very useful lesson: Do not let such mouldings touch the floor; leave about a quarter of an inch space, and then the carpet can be neatly slipped under them. Nearly all rooms have to be carpeted, not once, but every few years; and carpets have to be put down at least once a year, and many economical housewives have to change the carpets so as to equalize the wear and tear, and the architect or carpenter that compels them to add inch strips and fit around awkward mouldings, adds 25 per cent to their cost, and is very ignorant of an important practical point in his business.

Mrs. R.

Alameda, Jan. 12, 1886.

Professor Trilobite (eloquently)—"Yes; all things came by chance, and the great globe itself, like a mushroom, sprang up in the night." *Little Bessie Brighteyes*—"I should like to know, please, sir, where the seed came from."

Skilled Labor in San Francisco.

ALL departments in the building line are well supplied in numbers, with many at present unemployed. Those out of work, of course are the less qualified workmen, the first-class men finding constant employment. Should the season just opened up, and the year 1886 as a whole, develop activities as large as is hoped for and anticipated, there will be work for all, and a scarcity of really good hands. In fact, at the present time it would not be an easy matter to engage a full force of *competent*, wood-working mechanics to start up a first-class building of any considerable value, there being but very few reliable, good men disengaged. And with the increase of good to costly buildings under contract or day work, the present force of No. 1 men will scarcely be sufficient to meet the necessities. This, per force of circumstances, combined with the less important constructions, on which the lesser class of workmen can be utilized, will provide employment for all those worthy the name of mechanics. So that, while there is lack of employment for all just now, as the season advances there may not, nor is it likely there will be any surplus of house-building operations, and it is possible that during the busier period there may be a demand for more workmen in this city, particularly as Los Angeles, San Diego, Oakland, San Jose, Sacramento, and other cities and sections of the State are likely to require, collectively, a large building force, which will more or less draw from San Francisco.

RATES OF WAGES.

Bricklayers, $4 to $5, and for extra men, $5.50; carpenters, $2.50 to $3.50; mill hands, $3.50; painters, $3; plumbers and gas-fitters, $4; plasterers, $4 to $5; roofers, $3.50; galvanized-iron workers, $3 to $4.50; moulders, $3 to $4; tinsmiths, $3; hod carriers, $3.

The Gale and Rain in California.

THE severest wind storm that has been experienced in this State, or on this coast, in ten years, occurred during the week ending January 23. It was so unusual that people generally magnified it up to something frightful; yet, as compared with the storms, gales, cyclones, etc., we read about as occurring in the various parts of the United States, ours was but a moderate breeze, not to be mentioned in the same connection.

The unroofing of a portion of the Mechanics' Pavilion was the most natural result imaginable. Its general construction was never intended for extraordinary contingencies. Covering as it does about two-thirds of an entire block, with a total depth of 412 ft. 6 in., and nearly the whole of that entire space being one large apartment; and although the construction is but fair-weather and usual-California-storm strong, with its longer dimension to the storm side, it would have passed through the late blow unharmed had not an opening been made at the weather side of the building, which admitted a volume of wind under the roof and into the building, which again freed itself by lifting off a section of the roofing on the opposite side.

Numerous fences were blown down. Yes, and what wonder is there in that? Built with 4x4 in. posts, planted from 2 ft. to 3 ft. in the ground, and located from 5 ft. to 10 ft. apart, with two rails, each 2x4 in., the upper rails being simply nailed on top of the top ends of the post, with *two* or *six* nails, as the case may be, and the bottom rails cut in between posts and the ends nailed, often with no more than two, and sometimes with four or six nails. If the wind had been really *severe*, every fence exposed to the force of the storm would have gone down, particularly as the ground had been soaked with water for weeks, and the post-hole resistance was very soft. But many of the fences blown down and quoted as arguments in proof of the occurrence of a storm, were mere lightly constructed affairs put up by "bill posters" at their own expense, with privilege of use for posting show bills. These, of course, were exceedingly fair-weather affairs, and the fact that many of these remain unharmed, reduces the idea of *violence* of storm very much.

A number of the principal rafters on the Donohoe Building rocked and fell, some turning upside down, the king post swinging below the strain beam, instead of being erect on top of same. And why? Because the storm was "fearful"? No. The braces applied to hold the rafters in place were no more than those usual in such cases, with no special preparation against a high wind. If there had been a genuine *storm* the whole roof would have been lifted and destroyed, as the entire block of constructions were open on three sides, and a portion of the roof sheathed in.

Signs were blown down by the "storm," and the wonder is that the majority of them have withstood the trade winds of summer. A baby blow ought to have been sufficient to tear off the cloth from many of them, and to throw down others, the fastenings of which were never strong and sufficient.

There are many qualifying considerations like the foregoing serving to correct the idea that any terrible storm has occurred in California, as far as wind was concerned. If it had been as severe as some of the newspaper reports make it appear, the destruction to life and property would have been tenfold greater than what it really was.

The most sad and disastrous occurrence reported is that at Los Angeles, from the rush of water from a cloud-burst, or otherwise. But, taken as a whole, the "great storm" was a moderate affair, and not the great monster that some reports set up. The total losses by damages throughout the entire coast is very insignificant, considered as the result of a "devastating gale." At the same time, we admit considerable losses in certain localities by washouts and overflows, not specially from the late storm, but the result of the continuous heavy rains of the winter.

Damaged and "Caved-in Sewers."

EACH successive "rainy season" demonstrates the insufficiency of the street sewers of San Francisco. They are emphatically so, for the reason that they do not perform the purposes of their construction *fairly well*. As the annual period for the commencement of rain comes around, more or less anxiety is felt at the Street Superintendent's office and by citizens generally. The anticipation of rain acts as a premonition of danger—a warning to "look out for squalls," a sort of accepted certainty on all sides that breaks and caves are sure to follow the first rain of any consequence, and each succeeding down-pour from the clouds; and dread and fear always accompany the prospects of a storm, as no one is so silly as to imagine that the sewers of San Francisco are sufficient in either engineering or mechanical construction to "bridge over" even a moderately severe pressure without yielding at numerous points; and so the facts and experience of years prove.

FEARFULLY MISTAKEN—CIVIL ENGINEERING.

In general terms, the engineering that gave to this city the system of grades and sewers as they exist, is a specimen of short-sightedness, inexperience, bad judgment, or something worse, seldom if ever equaled with natural advantages anywhere near as great as those left by the hand of Nature as a basis of operations. Nor is it to be wondered at that

BREAKS AND CAVES ARE COMMON,

For at all times the outlets—the discharging ends at the city fronts, east and south, where eight-tenths of the discharges empty—are choked with debris or dead water; *i. e.*, from one to two thousand feet of the sewers lie at *dead level*, and their contents pass out only by reason of the pressure from the flow from higher points. This resistance from solid matter and dead water in the level parts is often attended with damaging effects, as it holds back and piles up in the sewers, to long distances from the outlets, large volumes of water, which frequently relieve themselves by escaping into cellars at weak points, through side sewers, or at the surface by breaks, or through man-holes.

DEFECTIVE CONSTRUCTION.

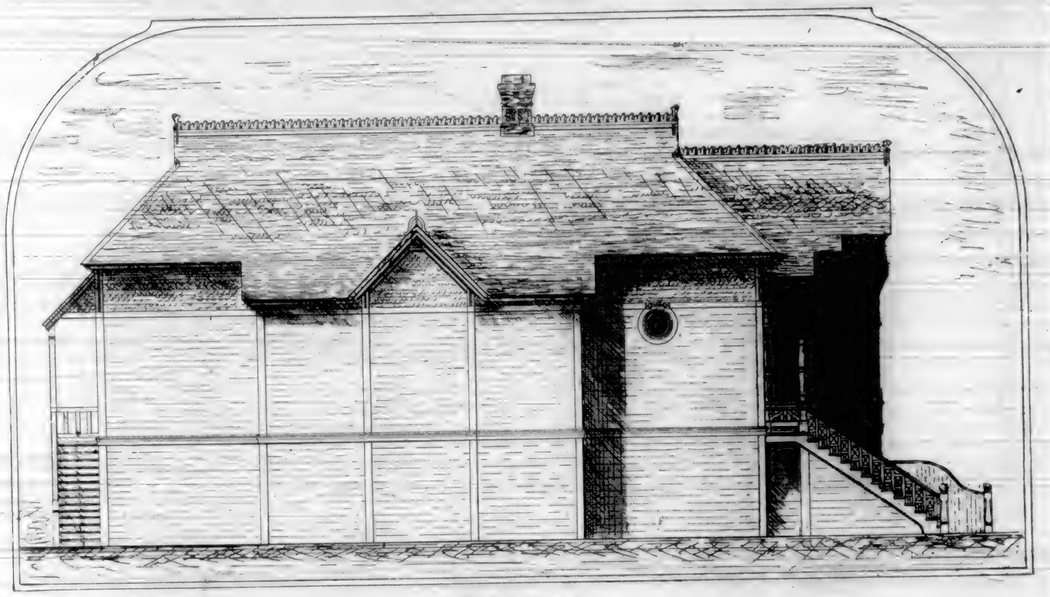
While portions of the sewers are fairly well constructed, it is a fact well known to all who are familiar with the way sewer work is managed, manipulated, and put through, that contracts are very frequently let to men, or the superintendence placed in charge of those who neither understand nor care anything about mechanical skill or good workmanship; or, if knowing, are oblivous to all the obligations imposed by that knowledge, and whose only concern is to make all the money possible out of the undertaking. Fair, right and proper profits are but secondary considerations. "*Get a contract, and make all you can out of it*," is the motto and rule of action, and any act of neglect or omission not likely to develop bad results too quickly is looked upon with indifference and utilized. In many parts the bricks in the sewer work are merely *placed* in position—not laid and bedded in good cement mortar as they should always be. Consequently it requires no very severe pressure of water, nor other test of strength, to make wreck and ruin of such work; and the numerous warning-signs from time to time placed in sewer breaks in various parts of the city, serve also, as a rule, in pointing out the spots where the sewer work is of the more "rascally" character.

These strictures, while strictly applicable to the subject matter in San Francisco, are, doubtless, more or less so in other cities. It would be unkind to claim for San Francisco that all the shrewd and clever artisans in legalized-by-custom, mechanical, mental, and practical rascalities had migrated westward and settled down in the metropolis of the Pacific Coast.

FRONT ELEVATION.

The Architectural Profession in Contract.

In no city or State in the Union, within circles reported by the architectural and class journals of the country, is there less of sterling active and progressive professional life than in San Francisco and California; a reaching out for more than personal gains and aggrandizements; a desire for enlargement of thought and ideas in a general sense, and mutual improvement and advancement in the higher possibilities of the profession. The most apparent thing manifest is, that each member of the profession feels sure in his own capabilities and relies upon his self-sufficiency, without realizing that self-sufficiency grows only on bad soil, and proceeds from inexperience—not necessarily the inexperiences of absent years, youth, but that which is worse, of men who have reached the solid period of manly vigor and prime of life, or, perchance, passed the line dividing the ascending and descending periods of human existence, yet have drawn so few lessons from the practical, living, ever-surrounding events of each day and year, as to remain ignorant of the great actuating, inspiring, advancing, persistent spirit and energy which have developed up and given to the world ten thousand joys and blessings, which have been more successfully, if not exclusively revealed, through and by the



SIDE ELEVATION.

desires of truly great minds and men to be useful to their fellowman. A life of usefulness is glory sufficient to adorn the brow or memory of patriot, statesman, hero or peasant. "The usefulness of a man is not to be estimated by the length of time during which he is employed, but by the character of the resources, powers, qualifications, which he combines and puts vigorously in operation, while he is engaged in any undertaking. Some men will be more useful in an hour than others will be in a year." It is the absence of this more generous trait of noble humanity that places the architectural profession at a disadvantage in San Francisco. The number of intelligent, clever, good architects is sufficient to keep alive measures, and prosecute plans and purposes that would place the profession, as a whole, upon a plane of usefulness far in advance of its present attitude. We clip the following from *Building*, which is but one of many similar cases heretofore presented in this journal, showing the widespread earnestness for professional intercourse and advancement:—

"The following will give an idea of the activity of the English architectural societies: The programmes of the coming session of the architectural societies are being issued. The Leeds and Yorkshire Architectural Society, which is the most energetic of those in the provinces, was opened on Monday, when the President, Mr. J. W. Connon, delivered an address. On the 26th inst. Mr. W. H. White will read a paper on 'The Past, Present and Future of the Architectural Profession,' which is sure to be epigrammatic and suggestive. In the course of the session the following papers will also be read: 'The Artistic Treatment of Ceramics, in Relation to Architecture and Decoration,' illustrated by drawings and examples, by Mr. James Holroyd; 'English Impressions of American Architecture,' by Mr. Arthur J. Gale; 'Points in the History of Collegiate Buildings,' by Mr. W. M. Fawcett, M. A.; 'Architecture of the Thirteenth and Nineteenth Centuries,' by Mr. C. Pebody, editor of the *Yorkshire Post;* and 'Church Architecture, Past and Present,' by Mr. Arthur W. Bloomfield, M. A. Mr. Aitchison, A. R. A., will also read a paper on a subject which has not been announced. One good feature of the meetings is that the principal firms in the town will exhibit designs in succession. This is a better arrangement than the simultaneous exhibition of a large number of designs by different architects. The Dundee Institute has not long been established, but some very good papers have been promised, such as the following: 'Architects, Their Work, and How Viewed by the Public,' by Mr. John Young; 'Smoke Consumption,' by Mr. George Macdougald; 'Egypt and Its Monuments,' by Mr. W. Stephenson; 'Our Gas,' by Mr. J. M'Rae; on 'Environment,' by Mr. W. Mackison. Mr. Browne, the President of the Edinburgh Architectural Association, is to deliver the closing address of the session."

In addition, full accounts are at hand, of the movements of architectural bodies in the various cities and States of America, all demonstrating earnest zeal, on the part of members of the profession, to open up and make perfect a better way than has been in past years. Brethren in California, is not the profession to you worth an effort that will place it in honorable record with those of other parts of the country?

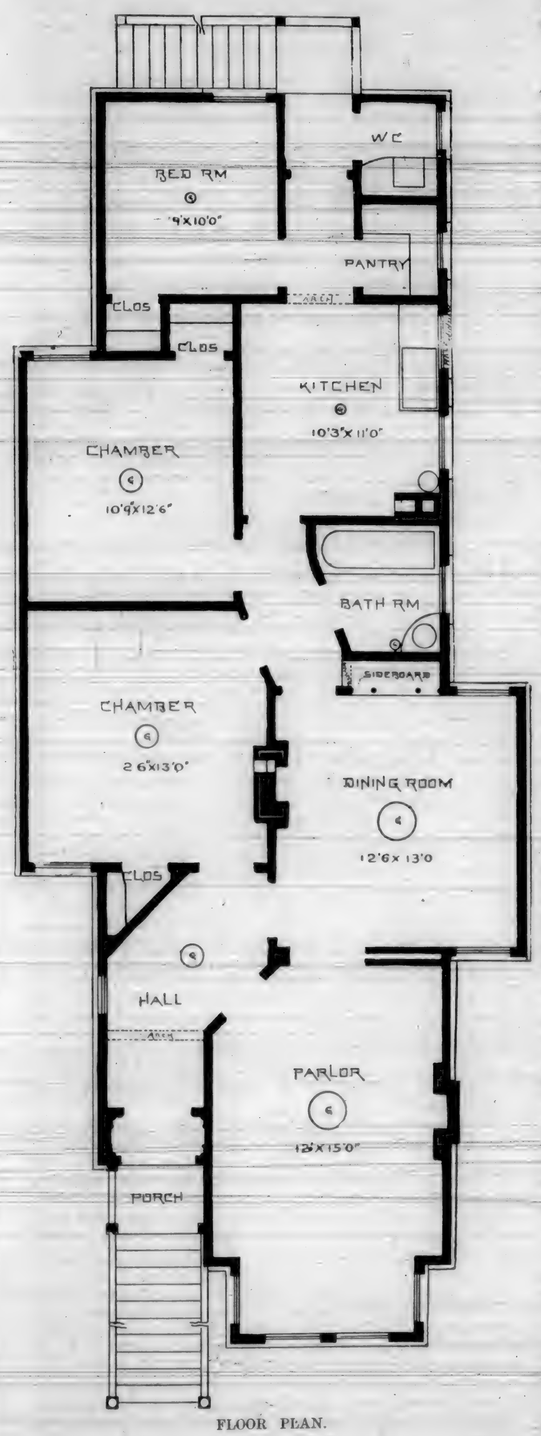
Science of Architecture.

[Special for this Journal. By F. Hillert, Architect and Mechanical Engineer.]

(Continued.)

For the calculation of the heater the previous formula for warm-water heating can be used; an average figure may be taken that a wrought iron steam heater can condense, in the state of continuancy, the temperature of the surrounding atmospheric air being 20°, 1.5 kg. (3.31 lbs.) of steam per square meter (10.76 sq. ft.) per hour's time, emitting about 800 units of heat, provided that the surface, being washed by steam, is equal to the heat-emitting surface. With other heaters a corresponding lower heat-emitting figure must be brought in account. Special precaution must be taken, and means provided, for the removal of the atmospheric air from conducting pipes and heater, when the system is set out of work, and air to be admitted. For this purpose air valves are to be set in, to be opened and closed by hand, or a self-acting arrangement being applied to do this work at the proper time.

The condensation water flows out at the lower end of the pipe,



FLOOR PLAN.

and, that no steam escape, a valve has to be put in and only opened so much that the water escaping is alike to the amount of water condensed; or, better, if this hand-work is done perfectly by a self-acting apparatus.

COMBINATION SYSTEM.

Advantages and defects, applicability, etc., of central heating, or the different systems of the same: The general advantage with central heating over local heating consists in the better using out of the fuel, the development of a more uniform, more lasting heat, in the simplicity of the management in heating, and warming a larger number of rooms or buildings from a single fire-place, and the keeping off of all disagreeabilities connected with the working and heating of single rooms. As a general defect is to be mentioned, viz., that all central heating—especially when first set in use—requires a certain amount of intellect in working the same, more than is ever expected in a plain domestic, the introduction of any of the central heating systems is to be desisted from on this account, which otherwise would find its place if the intelligent servant and the technical help could always be obtainable.

With the selection of different systems, the extent, kind, and amount of pretension to be made, condition of the locality, and the amount of means at disposal for the construction, form certainly the most important factors for consideration.

Before beginning the erection of the building, the heating system should be decided on, and worked out in all its details, the required channels, fire-place, chimneys, etc., to be executed during, and with the progress of the work.

I. AIR HEATING.

Advantages: Cheapness of the first cost, easy attending, strong current of air in the warmed rooms, fast heating of the same, safety of working, no freezing up of the channels in cold climates, and dispensing of heaters in the rooms.

Defects: Small extension of the system in the horizontal direction, when, by any considerable extension, two or more fire-places may be required. In the reconstruction of old buildings, the impossibility of application of the system. With the establishing of many fire-places in the building, the cellar may become so overheated as to render it unfit for many purposes. Irregularity of, or too strong, ventilation, when the building is exposed with more than one side to the wind, having a large cooling surface; in this instance, high cost and irregularities in the working and a small reserve of heat. With an imperfect (becoming imperfect) construction of the heating oven, causing danger of leaking and the consequent entry of smoke in the rooms and the singeing of the dust.

Applicability of air heating is, in general, for buildings of a small, horizontal expansion, where arrangements in the plan are made before the erection of the building. Especially recommendable is air heating for such buildings where cheapness is a consideration, and where the ventilation of the different rooms can bear a change. Air heating is applicable, also, for large halls, churches, etc., and for rooms which are only used periodically.

Very recommendable is air heating for the warming of air for ventilation purposes, when the rooms are heated by another system. Not advisable when, by any want of the good working of the air-heating apparatus in all its parts (even where experiments and changes are specially excluded, as in finer and better executed buildings), the use of the same causes the occupants to feel the inconvenience of some temporary small defect or disturbance. Not recommendable is air heating for large, extensive buildings, by the necessity of building a number of fire-places. Not applicable is air heating in a building in which rooms are heated by an apparatus and at the same time have to be ventilated with a certain strength of air. In such cases, heating and ventilation must have separate arrangements, requiring many channels, and on this account become impracticable in execution.

II. WARM-WATER HEATING.

Preferences and advantages: Agreeable, mild; uniform, and constant heat; capacity of regulating the temperature in each room; a rational and sure management; large expansibility of the heating arrangement horizontally; impossibility of singeing the dust of the room on the heater and conductors; the moderate use of fuel; the wear and tear very moderate; and, with a solid, good execution of the apparatus, safety against disturbances by the management.

Defects: The first outlay in money is considerable. With badly and faultily executed connections of the conducting pipes and heater, looseness and leakage are very possible.

Applicability: Warm-water heating can be recommended for dwelling-houses of any size, executive buildings, school houses,

hospitals, court houses, conservatories, etc.; anywhere where a uniform, constant, and mild heat is demanded, the ventilating apparatus to be put in independent of the heating

Warm-water heating is excluded where cheapness is a special consideration; also for the heating of large and coldly situated rooms only periodically occupied; for theaters, churches, and everywhere where a quick effect is wanted.

Execution: In the execution, attention is to be paid that the boiler permits a quick, high heating, and the whole apparatus have a corresponding proportionate receiver of heating capacity. Dwelling-houses, for instance, require a continuous, durable heat. The size of boiler and heater must be selected in abundant measure, since that an increase of the extent of heating, as in the case with hot-air and high-pressure heating, is impossible with water heating, the water in the boiler not being heated above 100°.

Special care must be taken to the tightening of the joints and to the solid construction of the heating bodies and heater, the latter to have a position in a room easy of access. Heaters must not be placed behind chimneys. Before setting the whole apparatus in operation, the conducting pipes being bricked in in the walls of the rooms, the whole must be tried for its closing up under a pressure of 5° atmospheric, there being a possibility of defects.

During the first days of use the whole should be carefully watched, and any accruing defects remedied. Of special importance is this with middle hot-water heating The bricking up of the lines of pipes in recesses of the walls of rooms, and closing them up, must be done—to lie free—so that the contraction and expansion of the pipes will not destroy the same. The filling of the apparatus with water, and discharging, is to be done at the deepest point, the first either by the pressure of the street main water-pipe, or by a pressure-pump. The apparatus during summer-time should remain filled.

III. HOT-WATER HEATING.

Preferences and advantages: Ease of arrangement, also in old buildings; quick fitting up; small first cost, only one-half to two-thirds of that of water heating; intensive action, therefore quick effect and simple management.

Faults and disadvantages: A very small reserve of heat and fast cooling off; in cold climates danger of freezing up.

Difficulties: Under conditions, the impossibility of holding a uniform temperature in the rooms heated; danger from explosion is not excluded, but not much to be feared. Explosions mostly happen in the fire-coil in the oven.

Applicability: Hot-water heating—if possible, always in the form of middle-pressure heating—is used for single, large rooms which are to be heated daily, meeting halls, restaurants, and, conditionally, for observatories, as well as for subordinate rooms, such as vestibules and stair-houses; also for subsidiary heating where other systems are difficult to be arranged—old buildings. Lately, this manner of heating is used for prisons.

Excluded: Hot-water heating appears to be excluded for rooms situated and exposed to cold, and to rooms seldom occupied; and is not recommendable for buildings in which the rooms requiring a uniform heat, or those requiring the heat to be regulated different and independent of each other, are exposed to different outside temperatures and different directions of the wind.

Execution: In the execution of the arrangement, make the system of pipes as short as possible, and, above all, connect in the distribution of rooms those exposed to the same conditions (size of the exposed surface and the same quarter of heavens), arranging the heating oven for facilities for convenient cleaning. Don't use any tightening material for the screw joints if, after testing the system under a pressure of 150° atmospheric before accepting the work, any looseness is shown. In arranging pipes behind wainscoting, see that the air can circulate around them undisturbed, and that a free circulation is established; make such arrangements that the circulating pipes can be cleaned from the dust lodged on them. In regard to bricking up and inclosing pipes, that said on warm-water heating holds good; pipes passing through brickwork must be inclosed and pass through a muff.

STEAM HEATING.

Preferences and advantages: Large and unlimited extension in a horizontal direction; the possibility of heating a number of rooms and buildings from a single fire; quick, intensive action; easeness of introduction, even in old buildings; easily altered to a combination of hot air, steam, or warm-water heating for single rooms or buildings of a whole arrangement; the possibility of utilizing the exhaust steam, as well as the steam used for other purposes; for cooking, washing, drying, and for heating of water.

Faults and disadvantages: High price of the first cost; a better solidity in the execution is necessary, for with carelessly executed work a looseness and a disturbing noise are created; heat reserve is nothing, since with the shutting off of the steam the action ceases; by the heating of pipes and heater above 100° centigrade a strong radiating heat is produced, by many found inconvenient and disagreeable; the municipal safety control over the boiler, there being danger of an explosion through carelessness, hence requiring a competent and skillful attendant.

Applicability: Steam heating is specially to be recommended, as steam-air or hot-water heating, for large public buildings, legislative buildings, high schools, theaters, insane asylums, hospitals, jails, etc.

Excluded: Steam heating appears to be excluded from dwellings and smaller structures, unless there be an occasion to use the steam for other purposes. The direct steam heating has in its action similarity with that of hot-water heating, and the steam-water heating with that of warm-water heating.

Execution: Steam heating requires in the distribution and arrangement great caution and experience. Special care and attention is to be used in the construction of the boilers, heating bodies, and the mounting of the conducting pipes; in regard to the boiler, what has been said on the quantity of water is to be observed; and to the heater and conducting pipes, attention is to be paid to the distance, and, after shutting off the steam, the admission of air; avoid the use of organic matter for the tightening of all the single parts; care is to be taken for the correct and safe discharging of the condensed water, also that the same never runs contrary to the current of steam; arrange all the supports of the pipes to be movable.

Cold Houses—Cold Feet.

THERE are but few, if any, of the ordinarily built houses, either in California or elsewhere, and only a portion of the pretentious class of private residences, in which the occupants experience exemption from the discomforts of draughts and coldness. Even with fires aglow, and doors and windows closed, it is difficult, during cold or windy weather, to secure equality and uniformity of temperature. From causes not transparent to the uninformed in the true and correct science of house construction, cold and chilling draughts enter and sweep through the apartments, contesting claims and asserting forces with the heat of the fire.

If the fire is sought for its warming and comforting effects, the cold draughts play their part upon the back, feet, or other parts not under the influence of the fire, and to a certain extent compromise personal comfort. Again, rooms may be heated to a temperature beyond healthful, and still in the lower parts be so affected by the inlet of cold air as to inflict the punishment of cold feet, all of which is, of course, detrimental to good health, even in the most hearty and robust constitutions; and in enfeebled and weakly persons, predisposed to ailments and sickness, it is a perpetual source of evil; and hundreds of thousands of cases of illness and death have their *origin* in the facts suggested. The practical questions that follow are, What are the causes, and what the remedies? The causes are many. Prominent and first: an absence of correct, constructive knowledge on the part of those directing construction—whether as architect, owner, or builder; or, if possessing the proper knowledge, then the causes assume the shape of deliberate and willfully wrong acts, which, so far as they go, inflict and impose upon others, harm, sufferings, and discomforts—reflect a degree of criminality upon the party responsible.

To discuss in detail the various mistakes made in house construction would require more space than is at present convenient. The remedy or avoidance agency in such cases is the engagement of an intelligent, practical, trustworthy architect, and to steer clear of that class of professional pretenders whose chief qualification is a nimble tongue, apt at repeating well-studied stories, and building word castles, embellished with all the trickery of misrepresentation.

Gems.

How can the laboring man find time for self-culture? An earnest purpose finds time or makes time; it seizes on spare moments, and turns fragments to golden account.—*W. E. Channing.*

Of the enormous coal deposits recently discovered in China, it is said that the area is greater than that of the coal fields of Pennsylvania, and that the yield is the best grade of anthracite.

A man writes to an editor for $4, "because he is so infernally short," and gets in reply the heartless response: "Do as I do—stand up on a chair."

FRONT ELEVATION.

The Inventor of the Circular Saw.

IN a lonely, secluded spot in the northwest corner of the cemetery, near the ever-beautiful little village of Richmon, Kalamazoo County, Michigan, the reader can find, on a pure white marble slab, nearly concealed from view by a large cluster of lilac bushes, engraved the simple inscription, "Benjamin Cummings, born 1772, died A. D. 1843." And who was Benjam n Cummings? He was the inventor of the circular saws now in use in this country and in Europe. Nearly sixty years ago, at Burtonville, New York and Amsterdam, this man hammered out, at his own blacksmith's anvil, the first circular known to mankind. He was a noted pioneer in Richmond; a first cousin to one of the presidents of the United States; a slave owner in New York State; a leading mason in the days of Morgan, at whose table the very elect of the great State of New York feasted and drank freely of his choice liquors and wines, a vessel owner on the North River before the days of steamboats; a captain in the war of 1812, where, after having three horses shot from under him, with one stroke of his sword he brought his superior officer to the ground for insult, and because he was a traitor and a coward; and after having been court-martialed, instead of being shot, he was appointed colonel in his place. In this lonely grave are the ashes of the man who, nearly seventy years ago, at Albany, New York, took up and moved bodily large brick buildings, and, to the wonder and astonishment of the world, constructed a mile and a half of the Erie Canal through a bed of rock, and who also built, on contract, those first low bridges over the same. He also aided in the construction of the first ten miles of railroad built in the United States, and founded both the villages of Esperence and Bostonville on the old Schoharie, near Amsterdam. The study and aim of this man's life appeared to be to do that which none other could accomplish, and when the object sought was secured, he passed it as quietly by as he would the pebbles on the sea-shore.

The New York *Tribune* suggests that the improvement in the iron trade is partly due to the economy of cost arising from the use of natural gas. Of course, this adds to the profit of producers by diminishing their expenses, but it has had nothing to do with the improvement of prices. The demand for iron is increasing.

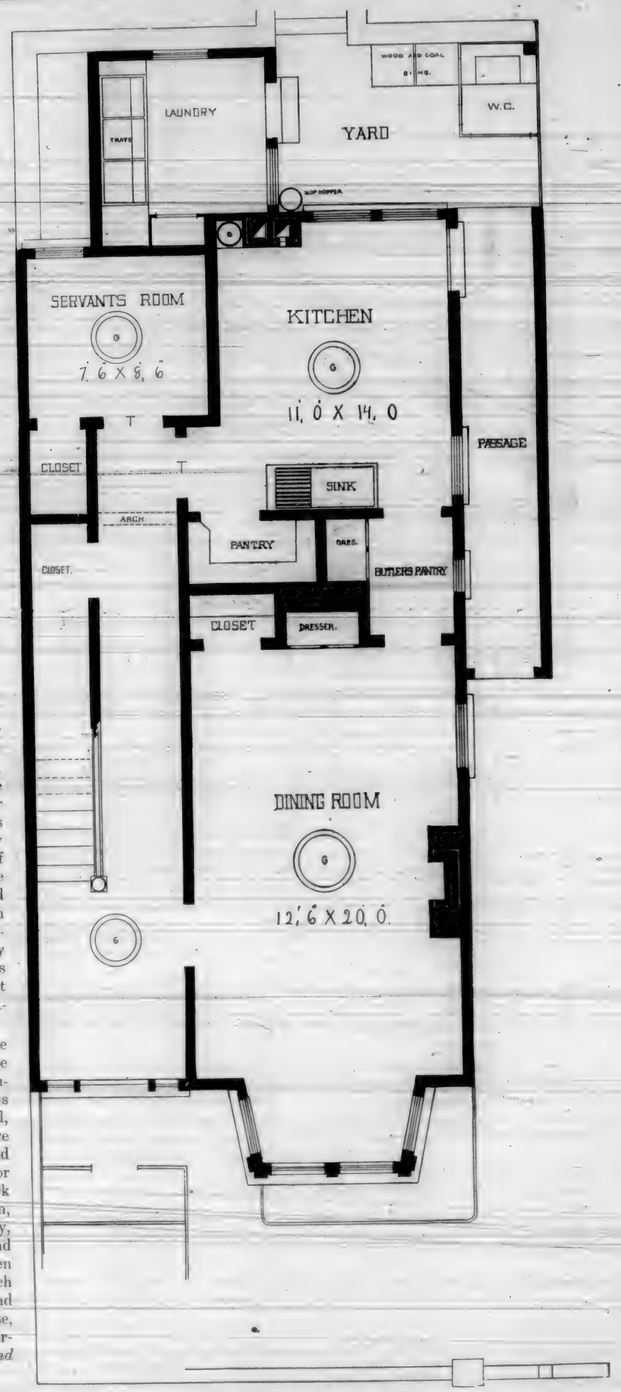
Dry Rot.

A RATHER singular accident took place a few days ago in Chicago, where a four-story brick building collapsed, early one morning, the whole interior falling into the cellar. The weakness of the structure was first observed by a boy, who saw a movement in the wall, and told the engineer, but was laughed at for his pains. Soon afterward, however, an alarm was raised, and all the persons in the building succeeded in escaping before it fell. The cause of the catastrophe is said to have been the dry rotting of the wooden girders, where they rested upon the posts. The building had been examined not long before, and pronounced safe, and it seems possible that the rotting of the timber may have been caused by painting it while green, and that the same coat of paint may have served to conceal the ravages of the fungus from those who inspected the work. Paint, which prevents the drying of the corruptible sap of green timber, is a common cause of decay, while the contact of the end grain of one piece with the side of another, as in the case of a girder resting on a post, is an equally common one, so that the safest way in buildings framed with such timbers is always to rest the horizontal pieces on iron caps or brackets, and to avoid painting until the work has become seasoned by years of use.—*Western Architect and Builder.*

Ornamental Brick.

ORNAMENTAL bricks, in addition to being produced in the ordinary red color, are also manufactured in caustic colors, as buff, brown, chocolate brown, black, etc., and they are also enameled in any desired hue, such as red, yellow, blue, green, etc. For ornamental bricks having caustic colors the coloring oxides are mixed with the clay in quantities usually of seven to ten per cent. The coloring oxide acts as fluxes, and the composition of the body must be altered in some cases to counteract this. Ornamental bricks, like ordinary pressed bricks, are sometimes colored under the glaze. When the color is to be applied under the glaze, the burned bricks are dipped into a slip of colored clay, formed usually of one part colored glass, ground, and two parts of clay, the latter causing adhesion of the slip, and the brick is either then fired, or, after being allowed to dry, is coated with a transparent glaze and then fired; but the bricks should be heated before applying the glaze, in order that all oily substances may be removed. When it is desired to apply the colors in the glaze, the brick is dipped into a transparent colored glaze, usually formed, besides the coloring oxide, of oxide of lead, silicious sand, and salt.

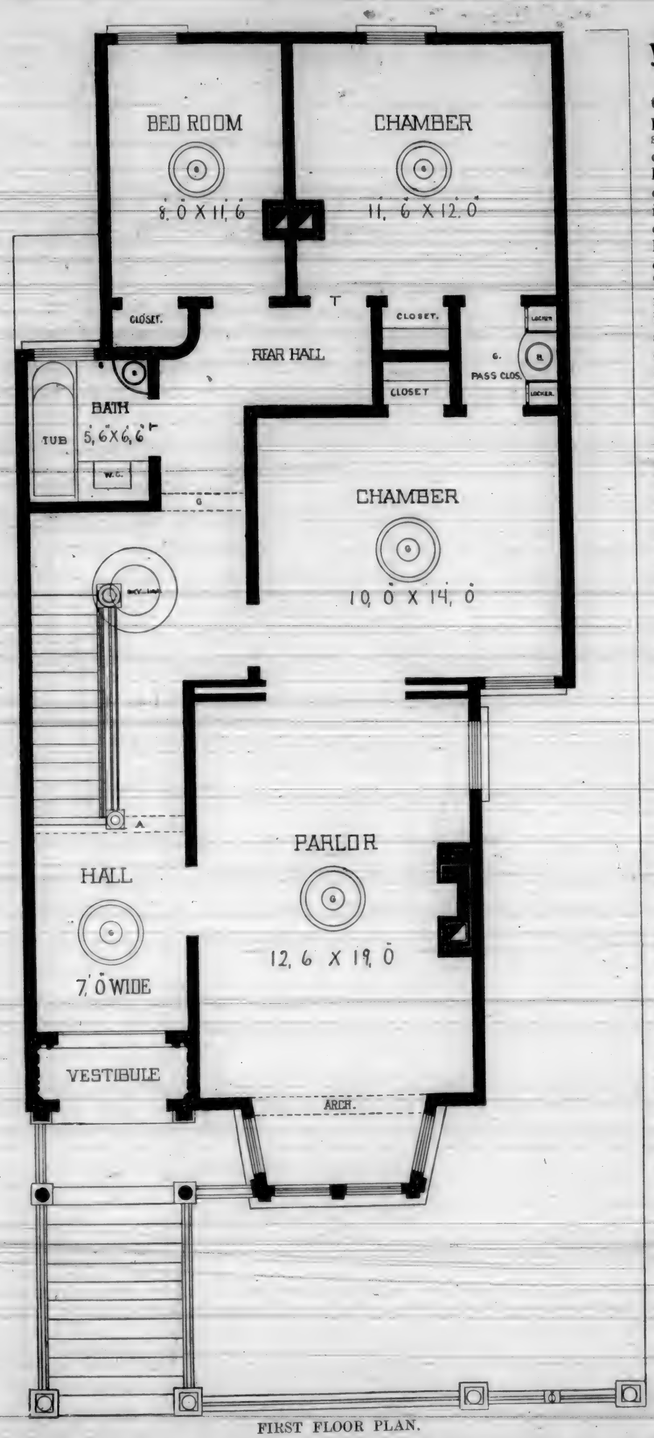
All enamels and glazes for ornamental bricks are usually applied to the one face or head which will be exposed after laying in the walls, except those intended to be used for corners and reveals of windows and door-jambs, which have one face and head treated, and are termed "rights and lefts" when they are so moulded and treated that they cannot be used for any corner. The colors now mostly used for architectural decorations and chromatic brickwork are the same, with the exception of buff and brown, as those employed by the ancient Egyptians, namely, red, yellow, blue, sometimes green, and white and black. In addition to the colors which have been given for ornamental bricks, there are others which are sometimes employed, especially for interior and expensive decorative purposes; they are turquoise, bronze-green, olive-green, violet, purple, orange, carmine, pink, gray and indigo.—*Western Architect and Builder.*



BASEMENT FLOOR PLAN.

PERIODICALLY complaints are made that the term horse-power is incorrect because it does not express the actual power of an average or even an exceptional, horse. This really makes no difference. The animal should be entirely eliminated from the mind, and the term taken at its exact meaning, viz., the raising of 33,000 pounds one foot high in one minute of time. A horse would fall far short of doing this for ten hours in a day; a steam-engine will do it for twenty-four hours.

IN 1880 the valuation of personal property in Florida was $30,938,309. In 1885 it amounts to $60,598,619. The increase comes from the encouragement given to Northern capital. There are other States in the South which might learn a valuable lesson from Florida. Over 50,000 Northern people have made investments in that State during the last five years, and many thousands of them have taken up a permanent residence.



FIRST FLOOR PLAN.

PRINTED matter may be copied on any paper of an absorbent nature by dampening the surface with a weak solution of acetate of iron, and pressing in an ordinary copying press. Old writing may also be copied on unsized paper, if wet with a weak solution of sulphate of iron, mixed with a small solution of sugar syrup.

Cable Road in Denver, Colorado.

THE first successful attempt at trial trips of the new cable car was made this week in Denver, Col., over a portion of the track of the Denver Electric and Cable Railroad Company on Fifteenth Street. The car ran a considerable distance, and at the satisfactory rate of eight miles an hour. A dynamo of twenty horse-power furnishes the motive power for the car. Quite a large number of prominent citizens took rides on the car. Prof. S. H. Short, of the Denver University, has worked very hard to make his invention a success, and his efforts seem to be already reaping their reward. The company have hoped to get their cars running in six weeks or a month. The car which is now being used in making trial trips, is shaped and fitted up very much like an ordinary street-car, and is fully as handsome in its style and appointments as any street-car in Denver. It was made by Woeber Brothers, of West Denver. The dynamo and other machinery, which is located in a building near the corner of Fifteenth and Tremont Streets, and which is used to propel the car, was made by F. M. Davis, of Denver, and all the plant and material used by the company will be of Denver manufacture. Ex-Governor John Evans, W. N. Byers, Rodney Curtis, and other well-known Denver gentlemen, are among the officers and directors of the new company. Some further trips will be made by the car, and large numbers of people will undoubtedly visit Fifteenth Street just below the Court House, and between Tremont and Glenarm Streets, and inspect the invention and its workings for themselves.—*Electrical Review.*

A Magnificent Project.

AN enormous scheme for the disposal of the sewage of London has been projected by Colonel Jones and Mr. Bailey Denton. Canvey Island, in the Thames, not far from its mouth, is a low, flat island of 4,500 acres area, which, although containing a few dwellings and a church, lies below the level of high tides, and the water is kept from overflowing it by embankments 10 to 12 feet high. To this island the proposition is to convey the sewage of the metropolis, and after purifying it by lime, which can be procured at small expense from the chalk which crops out on both sides of the river near by, discharge the effluent in the river on the falling tide, the low-water level being 10 to 12½ feet below the surface of the island. The solid portion of the sewage will be deposited on the surface and render the soil fertile and productive. The capacity of the island is such that it is estimated that it will take the sewage of London 100 years before it will be filled up to the level of the existing levees. If found profitable to do so, the liquid portion of the sewage might be pumped on to the mainland over a ridge 200 feet high and 5 miles off, and thence flow by gravity over a territory of 60,000 to 80,000 acres of arable land. The projectors estimate that the expenses of construction and maintenance could be met by a taxation of three-tenths of one per cent of the assessed valuation of the metropolitan district.—*Sanitary Engineer.*

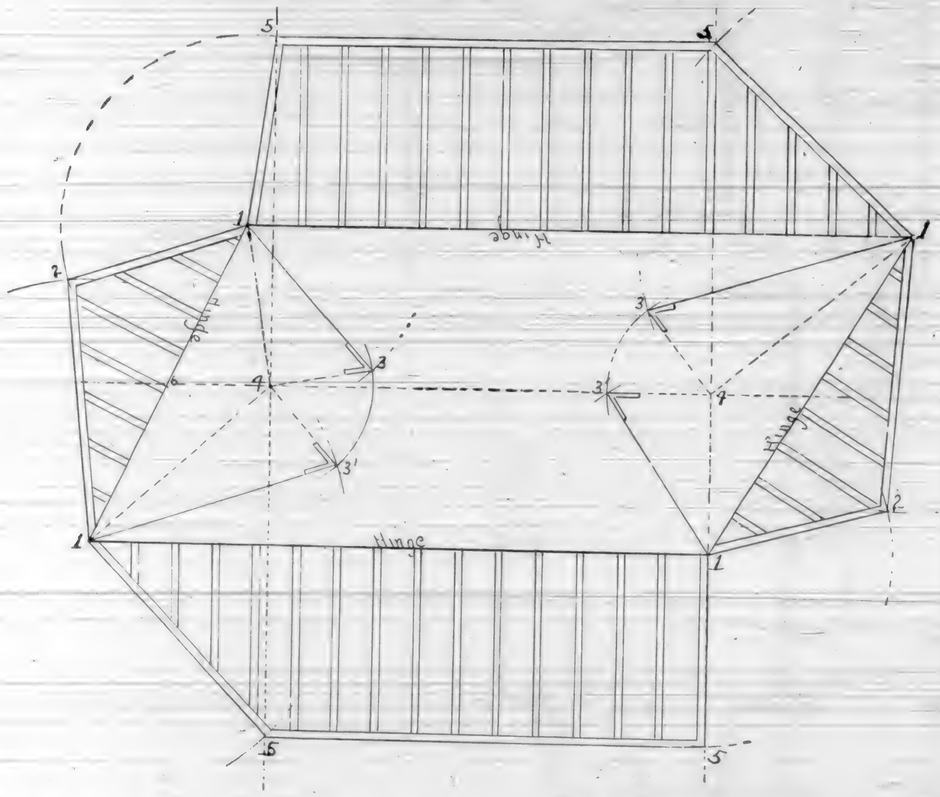
THAT part of Chicago in which the new Board of Trade Building is situated, was suddenly illuminated at 5:30 Saturday, the 23d ult., by a corona of electric lamps about the top of the tower of the Board-of-Trade Building, 312 feet above the street level. The plant is of 40,000 candle-power, said to be the largest mass of electric light and at the greatest altitude of any in the world. The engine furnishing the power will be started at dark every evening and run till daylight.

Graphic Illustration of Roof Framing.

(Continued.)

THE science of construction, through successive generations, has furnished material for all classes of interested minds and intellects, and the ever developing—new features of interest revealed by the solving of each successive problem, has served to sharpen up and vitalize ambitions and devices for other new—acquisitions in reducing to plain understanding that which has for long ages remained within the confines of unrevealed possibilities. As time rolls on, the scales of mystery continue to drop and fall, and difficult things that were, are becoming simplified and easily comprehended.

Roof construction has furnished innumerable points for solution, and the student of architecture, as well as the skillful artisan, has sought to grasp and reduce to easy mastery, the various seemingly difficult problems that have appeared. Ground plans that are regular, and of exact lateral and diagonal dimensions, to the less skillful, present no serious obstacles in the framing of the roof; but in cases where *acute* and *obtuse* angles occur, as shown by the accompanying illustration, a better and more thorough knowledge of the rules and principles of construction becomes necessary to a skillful manipulation of the material employed.



EXPLANATION.—The method illustrated by the accompanying diagram explains an easy and practical way of obtaining the results presented, which its author has applied successfully for many years:—

1 1 1 1 are the lines of ground plan; 6 4 is the height of elevation. Connect 1 4 as shown at each corner. Square out to 3 on each line; make 4 3 3, which gives the height of elevation. Connect 1 3, which is the length of hip rafters. Square out from 4 to 5, 5 5 5; then take the distance 1 3 in the compass, standing in 1; describe curve, cutting line 5, and again take 1 3, which is the shorter hip; stand in 1—draw curve cutting line 5, and bisecting curve 5 to 2—connect 5 1 1 2 2 1, and 1 and 5. This gives the length of hips in position.

The above applies to either or both ends of the roof—each being of like shape and proportions. Place the jack rafters at the desired spaces. To make a model, cut out of cardboard the form of roof as shown; then weaken the board by drawing a knife lightly around the base or hinge lines—the walls of the building—and stand up the wings, which will produce the shape of roof complete.

M. J. MARION.

Red Slate.

ALMOST all of the consumers of red slate rest under the impression that it is quarried principally in Vermont. This is an error. The only red slate in the world which it has been found practicable to quarry lies in the State of New York, although some of the quarries are so near to the Vermont line that shipments are frequently made from the latter State. From these facts the erroneous impression mentioned has arisen. As in all other colors of slate, the producers make two grades, bearing the usual distinction of No. 1 and No. 2. No. 1 is selected from the entire product, and consists only of the material which is smooth in texture, uniform in color, straight and free from "knots." All the rest of the slate which lacks these qualities is called No. 2, or second. Independent of this classification there is another concerning the color, which implies the dark red, medium, and the light or pink. The dark and medium colored slate is the best and strongest, and possesses that quality which roofing slaters always seek, called "metal," and roofing of this variety forms probably the handsomest covering which it is possible to obtain. The lightest or pink is apt to be brittle, and is not so strong, although some slaters prefer it because of the brighter hue. It is also apt to fade. For general purposes, such as strength, beauty of appearance and unfading quality, the medium bright red is deservedly the favorite. As stated above, it is found under producible circumstances only in New York, although veins have been discovered in other States, but they have not yet been found in sufficient quantities to be utilized.

IN Patagonia they fine a man two goats for killing his wife. The law is very strict on the subject, too, and if the fine isn't promptly paid he is compelled to marry again. This makes him hustle for the goats.

Large Plate Glass.

THE largest plate glass in use for store show-window purposes in San Francisco are those in the Murphy Building, corner of Market and Jones Streets; in all, forty-six sheets, running in sizes:—

2 plates	150x160 inches	2 plates	98x160 inches
2 "	142x160 "	2 "	64x160 "
4 "	136x160 "	1 "	70x130 "
1 "	130x160 "	2 "	70x150 "
1 "	128x160 "	4 "	70x136 "

The remaining sheets run 48x160, 28x130, 70x142, 70x128, etc. The handling, setting and glazing work was done under the direction of Mr. Thos. C. Butterworth, glazier, No. 7 Ninth Street, with mishap to but one sheet, which was made the subject of several very hypothetical newspaper items, but which in fact was no more than the fracturing of the lower end of one of the lights to a *small* extent.

The successful handling and placing of so many large, heavy sheets of plate glass, certainly evidence skill on the part of those doing the work; and had at least one of the lights been *destroyed* by accidental breakage, it would not have been a matter of any great surprise, as glass is a risky article to handle, requiring but slight violence to produce damage or total loss.

Size of Soil Pipes.

THE size of soil pipes should not exceed four inches. This is ample to carry off every possible form of discharge or combination of discharges to be met with in plumbing, even in the largest buildings, except for special hotel, laundry or manufacturing purposes. It is a mistake to suppose that because the fixtures are multiplied, the diameter of the soil pipe must be increased correspondingly. It is a rare occurrence, even in a hotel building, that several water-closets are fluted at exactly the same instant, and even if they were, their distance from each other, and the capacity of a four-inch pipe, would give ample room for the escape of the water. The choking of a pipe is far oftener due to its being too large, or to faulty construction, than to its want of sufficient size. The great perpendicular extension of plumbing pipes also facilitates the discharge, and pipes, which for land drainage would be much too small, will be found ample for plumbing purposes, on this account.

When it is considered how important it is that soil and drain pipes should be as thoroughly scoured as possible by the discharges sent through them, and remembered that the smaller the pipe the more perfect the flushing, we should be inclined to reduce our soil pipes to a size even smaller than four inches, were it not for the careless usage slop hoppers and water-closets are so often subject to.

The trap of water-closets is frequently made of pipe as much as four inches in diameter, and large pieces of newspaper are often used where toilet paper alone is suitable. This, and the carelessness of servants who will throw into a closet anything which is small enough to pass through its trap, would cause a great amount of annoyance and expense if the soil pipe were smaller than the trap of the slop hopper or water-closet. Hence, we have fixed upon four inches as both the smallest and largest size of soil and house drain pipe, and no other size should be used except for rare and exceptional cases.

IN Minneapolis, Minn., during the year 1885, there was expended in new buildings over $9,700,000, with which were erected 2,907 residences, 43 manufacturing establishments, 22 churches, 10 school-houses, 16 store-houses and elevators, 8 city buildings, and 150 business blocks. In St. Paul the amount expended for a similar purpose was $7,234,834, and the number of buildings erected was 3,451.

San Francisco Chapter.

OWING to a change in the time of issue of this journal, the 5th inst., and the monthly meeting of the Chapter occurring on the same day, report of proceedings will necessarily lay over until the March issue.

VERMONT has joined the onward march of civilization. The star of empire which has for a number of years been monopolized at the West, is to be lured back to its starting-point on the eastern shore of Lake Champlain. A street-car line, the first ever built in the State, was formally opened the other day in Burlington, with demonstrations suited to the importance of the event. Bands of music, speeches, rockets, Chinese lanterns, illuminated stores and dwellings, and a decorated car drawn over the line by six mules, gave significance to the occasion. It must be said, however, that the success of the enterprise was largely due to local rivalry, the citizens of Burlington having heard that a similar project was on foot at Rutland, which is only a village, with selectmen and fence-viewers, while Burlington is a city, with a mayor and ash-inspector.

Since the cable street railroad in Chicago was opened, there have been a great many improvements on the system patented, but the improvements do not run away from the original very fast. It was assumed that the gripping device was too cumbersome and heavy for Eastern refinement, so when the Brooklyn bridge was provided with a cable road, a brand new grip was adopted, the production of the matured genius of New York. That grip was a shining success only in one way. It gave daily lessons of patience to the restless people of Brooklyn by its numerous failures to move the cars for half an hour after an attempt was made to start. The people of Philadelphia were above borrowing any part of the cable system from Chicago or San Francisco, so when they built a road in Market Street, they adopted an original system entirely. It is being operated now the greater part of the time by the help of horses. On a recent juncture, the grip took occasion to vary its record by holding, and it held so well that the man in charge could not induce it to let go; so the car went tearing along like a Juggernaut vehicle, smashing everything within reach. There are indications that the new cable road opened in New York will be a most uncertain means of getting around on, but the promoters of the company have the satisfaction of knowing that they succeeded in eluding the patents that cover the system of operating the older cable roads.—*National Car Builder.*

THE FIRST TRAPPED WATER-CLOSET on record is that invented by Alexander Cumming, and patented in 1775. The basin is bowl-shaped, and the water is delivered into the lower part instead of at the top, while the soil-pipe is recurved about 12 in. or 18 in. below the basin, so as to constantly retain a quantity of water sufficient to cut off all communication of stench from below. In 1777 another water-closet was patented by Lemuel Prosser, but does not appear to have been adopted; in 1778 the well-known valve-closet of Bramah was patented. The expensive character of Bramah's arrangement led later to the introduction of the pan-closet and D-trap, which are now being removed wherever this can be done. Dr. Corfield then proceeded to describe more in detail the various apparatus in use, and the methods of disconnection of waste-pipes from drains, as well as drain ventilation. In conclusion, attention was directed to the decision of Mr. Justice Quain, that it was implied in an agreement for taking a furnished house for a short period that the house was fit to live in; and as to the proposal to introduce a similar provision for unfurnished houses into the Housing of the Working Classes Act, Dr. Corfield thought it was wise to limit this provision to houses occupied by the laboring classes, as it would otherwise have led to an excessive amount of unnecessary and vexatious litigation. He was of opinion, moreover, that the certification of houses as to their sanitary condition by local authorities would be unsatisfactory, and that greater good would be done if this were left to individual effort.—*Sanitary World.*

THE fact is, a man gets religion a good deal like he gets the measles. A fellow gets tangled up with the measles, and in about ten days the doctor comes, gives him a cup of good hot tea, and tells him to keep on taking that until it breaks out; and then keep it broke out, and he will be all right. So some of you have got tangled up in this meeting until you feel as bad as a fellow with the measles before they break out. A few hot cups of gospel tea will make religion break out all over you. Then keep it out, and you are all right. But, like the measles, if it goes in on you, it will kill you, sure.—*Sam Jones.*

Sewer Gas and Its Uses.

WHEREVER there are sewers, it is certain that there will be sewer gas. If confined within the sewer, or permitted to escape into the open air, it can do no harm. In the first instance, it is imprisoned and helpless; in the second, it is robbed of its power by the oxygen of the atmosphere. It is only when it finds its way into houses, drives out pure air, and is unconsciously taken into the lungs, that it becomes the enemy of the human race. Sewer gas is not often instantaneous in its effects, but it is none the less certain. It may be the source, or promoter, of all the so-called zymotic diseases. A zymotic disease is defined as "any epidemic, endemic, contagious, or sporadic affection which is produced by some morbific influence acting on the system like a ferment." This technical definition is not so comprehensible as the plain statement that zymotic diseases include typhoid, typhus, scarlet, cerebro-spinal and malarial fevers, small-pox, measles, diarrhea, dysentery, cholera, cholera morbus, cholera infantum, croup, diphtheria, whooping-cough, puerperal diseases, and some others. A prominent writer says: "If we look for the cause of the large mortality from zymotic diseases in our cities, we find it principally in sewer-gas poisoning. Other causes operate to swell the total, but to bad plumbing we may attribute the prevalence of pythogenic pneumonia, peritonitis, inflammatory rheumatism, typhoid and malarial fevers, croup, diphtheria, and many kindred diseases, which are almost epidemic in all our large cities."

Sewer gas does not always kill. It poisons the blood of once healthy men and women, and destroys, or cripples, their capacity for business or enjoyment. It robs men of ambition, and women of beauty. It paves the way for specific diseases which would otherwise never have sent strong men to bed for months. There are those in the city whose lives were imperiled by it, but who fled from its presence; years have passed and the poison has not yet been driven out of their veins.

There is said to be a distinct, odorless and non-analyzable element which has been denominated sewer gas, and which is as deadly in its effects as sulphureted hydrogen. If this is true, it is seldom met with. The term sewer gas is more commonly and properly applied to the pent-up foul odor which may be found in any sewer or its connections. It is easy to understand that this gas is laden or saturated with particles of decaying animal, vegetable, and excrementitious matter, which finds its way into the sewer. If this gas is breathed into the lungs, thus laden with poison, the blood must of necessity be contaminated. Further than this, the air which escapes from the sewer may bear with it the germs of contagious diseases, and deposit them where least expected. It is possible—it is probable—that the blood-poisoning resulting from the breathing of sewer gas is due to chemical changes in organic matter which has been taken into the lungs. This may come from the sewer, catch-basins, drains, privy-vaults, or waste-pipes. Sewer gas, or its equivalent, is generated in an outdoor privy vault, but it comes so soon in contact with the surrounding atmosphere that it is rendered comparatively harmless. The air which escapes from sewers into houses is dangerous because it is not diluted, nor disinfected by pure air, and because its confinement increases its potency. If all sewers were open at the top throughout their entire length, there might be no danger from the exhalations, except possibly from the germs of contagion which may have been carried into the sewers by water used in bathing the bodies of the sick. But this danger could not be so great as that which to a limited extent attends the breathing of the atmosphere which has swept through a sick room, and which many people do unavoidably and with apparent impunity breathe. In some cities of Europe sewage is conveyed away in open gutters, without serious discomfort or danger. In other cities there are open man-holes leading to the sewers, and the gases generated are allowed to pass off freely and without danger. Sewer gas is to be feared when it insidiously and persistently finds entrance to houses, offices, or buildings of any description in which people live or work. There are some people who believe it can do no harm; others know by sad experience that it is destructive of health and robs life of enjoyment, but they imagine that they are helpless against it. Again, there are many thousands suffering from its effects, and they are entirely ignorant of the fact. In mercy to this third class the warning note should be sounded, and for their especial benefit, as well as for those who know no remedy, the means for shutting sewer gas out of houses, if there are any, ought to be made known in the fullest and widest possible sense.

DRAUGHTMAN'S ASSOCIATIONS are assuming an important part in architectural advancement and improvement in the Eastern, and particularly in the Northwestern cities and localities. The young men are realizing that time lost can never be regained, and are, therefore, preparing for the future by taking care of, and utilizing the possibilities of the present; the aims and objects in all cases being for like purposes,—mutual enjoyment, general instruction, and a more thorough and perfect understanding of the ever fruitful developments which each day's experiences bring to the surface.

The "sketching clubs" are fruitful of much good, as they afford a wide range of thought, naturally embracing furniture, ornamental glass, frettings, and endless other objects and forms, all tending to improvement, culture, and the higher attainments. When will the young men of the Pacific Coast enter upon like worthy efforts?

"ON my way over," the Saginaw man said, "I was thinking what a small amount of business foresight the most of us have. There are men with millions lying idle; these men are crying aloud that if they could only find a good chance for investment they would untie their money bags; but are they not blind? How many of them purchased steel rails when they could be bought for about $25 a ton? They must have known that they could not go much lower, and eventually must go much higher. How many of them invested in pine when it was low? Precious few of them. The money in pine lands has been made by hard-headed old lumbermen who invested because it was in the line of their business rather than as a speculation. Capitalists are like the rest of mankind—they run in ruts. They keep an eye on the price of stocks and bonds, the direction in which money is naturally bent, but are blind to outside chances for investment, where profits would be almost absolutely sure.—*Northwestern Lumberman.*

"NO GIRL gets along well without a mother," says a moralist. Very true; so they don't. See what a mess Eve made of it by not having a mother. If she had been under the restraining influence of a mother's counsel and love, she would not have listened to the advice of the snake, and the apple would not have been marked by her pearly teeth. A girl that can't get a mother should do the next best thing—get a mother-in-law.

Market Report.

LUMBER—Nothing doing in cargo lots, and prices for same are $1 50 to $2 below the following rates, which are for retail lots:

Pine, Rough, merchantable	per M feet,	$14	00
" " No. 2	" "	11	00

MASONS' AND BUILDERS' EXCHANGE OF SAN FRANCISCO.

ROOM 11, 314 MONTGOMERY ST.

BELOW will be found a list of the members composing this Exchange. Boxes are provided for each member, so that architects, owners, or others desiring the services of any particular member, or those having boxes who are not members, and yet whose business is directly connected with that of the Exchange, can readily secure the attendance of the party sought, by leaving a note in the respective boxes.

ARCHITECTURAL STUDIES.

PART. III.—With Thirteen Designs; also numerous Designs for Stables.

By F. A. WRIGHT, ARCHITECT.

Instructive and suggestive in good ideas. Published by W. T. COMSTOCK, N. Y. Price $1 per number, or part.

BUILDING.

An ably conducted Class Journal, devoted to interests suggested by its title.

Published by W. T. COMSTOCK, N. Y.

Weekly edition, $5 per annum; with this Journal, $6. Monthly edition, $1.20; with this Journal, $2.70.

BUILDING INTELLIGENCE.

Where owners' names are left blank, it is so done in most instances by special request.

[*ERRORS CORRECTED.—Our earnest desire is to avoid errors in every connection, and be as nearly correct in every statement as possible; and the patrons and readers of this journal will confer favors by calling our attention to any error that may at any time occur.*

In January's issue Charles Crocker's building was located on "Brush Street" instead of "Bush Street." The building owned by Mrs. Eliza R. Dingerfield, on Jackson Street, near Van Ness Avenue, was twice reported at a cost of $2,000, thereby swelling the total in the amount named. A building on Scott Street, near Devisadero Street, reported "James Geary, owner," should have been "Mrs. Pelton, owner; James Geary, contractor," and the amount of cost should read, "about $6,000," instead of $3,000," thus reducing the totals $3,000. A few errors in names occurred, an initial, or letter being added or omitted, the result of difficulties encountered in obtaining the correct names. The two discrepancies noticed adds to the credit of January's totals, $1,000.]

B

Bush, nr. Scott. Three-story frame.
O.—Mrs. Anna Sebiling.
A.—Salfield & John.
C.—Hutchinson & McLane.
$6,500.

Bryant, nr. Eighth. Alterations.
O.—J. O'Keif.
C.—Jas. Mannihan.
$1,000.

Bush, bet. Baker and Lyon. Two one-story frames.
O.—T. Martin & Bros.
Day work.
$5,000.

Bartlett, bet. Twenty-third and Twenty-fourth. Repairs and additions.
O.—Julia Whitney.
A.—M. J. Welch.
C.—E. & F. J. Owens.
$600.

C

Church, nr. Thirtieth. Two-story frame.
O.—S. D Young.
Day work.
$2,000.

California, nr. Scott. Two-story frame.
O.—Hettie H. Morse.
A.—J. H. Littlefield.
C.—S. Hatfield.
$3,700.

D

Devisadero, bet. Sutter and Bush. Repairs.
O.—H. M. Newbauer.
A.—P. R. Schmidt.
C.—A. Anderson.
$900.

Dupont, nr. California. Additions.
O.—Gross & Baur.
C.—Trumson & Perry.
$1,500.

E

Eighteenth, nr. Church. One-story frame.
O. and B.—W. Tegeler.
Day work.
$1,500.

F

Folsom, nr. Fourteenth. Three-story frame.
O.—Geo. Schaffer.
A.—Salfield & John.
C.—B. Dryer.
$8,000.

Franklin, cor. Sutter. Two-story frame and brick basement.
O.—M. Brown.
A.—P. R. Schmidt.
C.—C. Chisholm; brick work, E. R. Shain.
$25,000.

Fourteenth, bet. Valencia and Guerrero. Two-story frame.
O. and B.—P. J. Haver.
Day work.
$2,500.

Fremont, cor. Harrison. Additions to Catholic Church.
O.—Father Nugent.
A.—T. J. Welch.
C.—P. F. Lynch.
$500.

G

Gough, bet California and Sacramento. Two-story frame.
O.—Geo. Bremner.
A.—H. D. Mitchell.
Day work
$6,500.

Grove, nr. Webster. Additions.
O.—W. Lang.
Day work.
$1,000.

H

Howard, nr. Twenty-fourth. Two-story frame.
O.—F. Stowe.
A.—S. Babson.
C.—W. Clark.

Haight, nr. Steiner. Two-story frame.
O.—Mrs. Lahey.
A.—Geo. E. Voelkel.
C.—Mart. Weber.
$4,600.

Howard, cor. Eleventh. Two-story frame.
B. and C.—Wm. Denney.
Day work.
$2,000.

Hyde, cor Sacramento. Seven two-story frames.
O. and B.—John Hinkle.
Day work.
$30,000.

Hattie, nr. Seventeenth cor Corbett Road. One-story frame.
O.—C. Trost.
C.—A. Discher.
$1,000.

J

Jessie, nr. Seventh. Two-story frame.
O.—W. Conklin.
C.—P. Laherity.
$1,500.

L

Lyon, bet. Pine and California. One and one-half story frame.
O.—P. Connelly.
C.—H. Monrad.
$4,000.

Larkin, cor. Hayes. Repairs to Pavilion.
O.—Mechanics' Institute.
Day work.
$4,000.

M

Mission, nr. Tenth. Two-story frame.
O.—Johannah Cassidy.
A.—Geo. E. Voelkel.
C.—I. K. Delmas.
$4,250.

Market, n s, bet. Mason and Taylor. Alterations.
O.—J. Gordon.
A.—Geo. E. Voelkel.
C.—C. O. Schnoor.
$1,200.

McAllister, bet. Lyon and Lott. Two-story frame.
O.—Mrs. Ash.
A.—T. J. Welch.
C.—Jas. Irwin.
$3,500.

Market, bet. Fourth and Fifth. Additions and alterations.
O.—Jesuit Society.
C.—M. Lynch.
$2,000.

Morton, bet. Kearny and Dupont. Two-story brick.
O.—N. L. nning.
A.—Piercy & Hamilton.
C.—Gray & Storer.
$3,000.

N

Natoma, bet. Seventh and Eighth. Two-story frame.
O.—Mary McKenna.
A.—C. J. I. Devlin.
C.—Bateman Bros.
$3,600.

Noe, nr. Seventeenth. Two-story frame.
O.—T. B. Grant.
Day work.
$2,500.

Ninth, cor. Bryant. Three-story frame.
O.—R. Cummings.
A.—M. J. Welch.
C.—W. W. Fowler.
$5,000.

O

O'Farrell, bet. Octavia and Laguna. Two-story frame.
O.—Mrs. Harrington.
A.—H. Geilfuss.
C.—H. Thom Whorden.
$4,200.

Oak, bet. Gough and Octavia. Two two-story frames.
O.—Mrs. DeLanger.
A.—T. J. Welch.
C.—R. Doyle & Son.
$6,700.

Oak, bet. Lyon and Lott. One-story cottage.
O.—A. J. Young.
C.—G. G. Gellispee.
$2,000.

P

Pacific, bet. Taylor and Jones. Two-story frame.
O.—Mrs. Scott.
A.—H. Gielfuss.
C.—Dom. Kreger.
$3,400.
Should have been reported last month.

Presidio Reservation. Four three-story frames.
O.—U. S. Government.
A.—J. H. Humphreys.
C.—F. Crowley.
$15,000.

Presidio Reservation. Two two-story frame barracks, brick foundation.
O.—U. S. Government.
A.—J. H. Humphrays.
C.—J. S. Tebballs.
$10,000.

Pierce, nr. Sutter. One-sto me.
O.—S. Nichols.
C.—S. H. Shanks.
$2,400.

Post, cor Scott. Two two-story frames.
O.—Mrs. Rebecca M. Davis.
A.—Copeland & Banks.
C.—Geo. R. Lang.
$14,000.

Post, nr. Scott. Two two-story frames.
O. and B.—J. C. Wier.
Day work.
$8,000.

Pine, nr. Steiner. Additions and alterations.
O.—John Reilly.
Day work.
$2,200.

S

Sixth, bet Howard and Folsom. Additions and alterations.
O.—W. Bloom
A.—S. & J. C. Newsom.
C.—J. H. McKay.
$2,000

Sutter, bet. Leavenworth and Hyde. Two-story frame.
O.—B. Marshall.
A.—Eisen & Pierce.
C.—Moore Bros.
$5,500.

Stockton, southeast cor. Stockton Place. Five-story and basement brick.
O.—L. & M. Sachs.
A.—P. R. Schmidt.
C.—McGowan & Butler.
Carpenter Work.—T. Riddell.
Iron Work.—O'Connell & Lewis.
$65,000.

Sacramento, bet. Franklin and Gough. Additions.
O.—E. F. Preston.
A.—Curlett & Cuthbertson.
C.—D. Perry.
$6,000.

Sutter, west of Larkin. Four-story and basement frame.
O.—
A.—McDougall & Son.
C.—
$20,000.

T

Tenth, nr. Mission. Two-story frame.
O.—F. T. McAuliffe.
Day work.
$1,500.

Twentieth, bet. Guerrero and Dolores. Two two-story frames.
O.—J. Boyhen.
A.—B. J. Clinch.
C.—P. J. Brennan
$4,600.

Twenty-third, cor. Fair Oaks. Two-story frame.
O.—W. Oakley.
A.—Townsend & Wyneken.
C.—F. W. Kern.
$4,500.

Treat Avenue, nr. Twenty-first. Two-story frame.
O.—H. Birth.
C.—W. Shiffield.
$3,550.

W

Washington, nr. Baker. Two one and one-half story frames.
O. and B.—W. Pluns.
Day work.
$5,000.

Washington, bet. Fillmore and Steiner. Two-story frame.
O.—Mrs. M. J. Meek.
C.—J. C. Wier.
$4,000.

Washington, cor. Stockton. Alterations.
O.—Methodist Chinese Mission.
A.—J. Marquis.
Day work.
$2,000.

ALAMEDA.

Central Avenue, nr Willow—1-story ctg; o, C. C. Kinsey; a and b, F. N. Delanoy; $3,000.

Central Avenue, nr Union—2-story fr; o, C. H. King; a and b, F. N. Delanoy; $3,000.

Park, nr Central ave—Additions; o, Methodist Episcopal Church; c, Jackson & Johnson; $500.

Santa Clara Avenue, below McPherson—1½ story fr; o, H. Spotz; c, S. W. Ducker; $2,500.

OAKLAND.

San Pablo Station—2 1½ story ctgs; o, M. Bolander; a, Eisen & Pierce; c, J. A. Boynton; $4,000.

Center, cor Fifth—1-story fr; o, W. Henderson; day work; $1,000.

MISCELLANEOUS.

San Jose—Two-story frame dwelling. O., E. J. Bassett: C., R. Summers; $3,200. Cottage. O., F. K. Ledyard; C., H. Clifton; $2,500. Cottage. O., H. L. Andrews; C., A. Kelsey; $1,800.

MIND IN NATURE.

A popular Journal of Psychical, Medical and Scientific Information.

Published Monthly, by the Cosmic Publishing Co., 171 West Washington St., Chicago, Ill.

Among the special contributors are: of Chicago: The Rt. Rev. Samuel Fallows, H. W. Thomas, D. D., Prof. David Swing, Dr. H. M. Lyman, Dr. O. A. King, Rev. Geo. C. Lorimer, Rev. L. F. Mercer; of New York: The Rt. Rev. A. Cleveland Coxe, D. D., LL.D.; of Washington, D. C.: Prof. Elliott Coues, Prof. C. V. Riley.

Printed on heavy, fine book paper, with antique laid covers. Only one dollar per year. Single copy, ten cents. Send for sample copy.

"NONE SUCH" CHIMNEY TOP AND VENTILATOR

See Cut in this Place next Month.

THIS VENTILATOR is especially valuable for regulating draft (upwards and downwards) made by the light, unstable atmosphere of the Coast Range of Mountains. The hundreds of tall stovepipes erected on the chimney tops of houses indicate inconvenience and trouble in the kitchen, the parlor, and chambers below.

SAN FRANCISCO, October 26, 1885.

To whom it may concern:

I take pleasure in stating that the "None Such" Chimney Top and Ventilator, which was put upon the smoke-stack of the Baldwin Hotel about two months ago, has given complete satisfaction.

It has increased the draft to such an extent that there is a perceptible saving in the amount of coal consumed; smaller fires than heretofore will now answer to keep up the steam, thus causing a great saving of the boiler also. We have heretofore had much difficulty in keeping up the amount of steam steadily required, owing to the lack of draft, all of which is now remedied by the use of the "None Such" Chimney Top and Ventilator. I heartily recommend its use to all persons, where a strong draft is required.

What They Say.

"A Journal of Architecture. The first number of the eighth volume of the CALIFORNIA ARCHITECT AND BUILDING NEWS appears in an enlarged form and new type. These signs of prosperity denote an appreciation of the journal by the class in whose interest it is ably conducted."—*S. F. Chronicle, January 18, 1886.*

"The Architect's Organ. The CALIFORNIA ARCHITECT, a monthly published in this city, has been enlarged and much improved, and the number issued to-day is one that would be a credit to any city. It is a publication that should be of great use to property owners and those who contemplate building."—*Stock Report, January 16, 1886.*

"THE CALIFORNIA ARCHITECT AND BUILDING NEWS comes to us with the opening of the new year very much enlarged and improved. It holds its own remarkably well against the older Eastern journals of the same class."—*The American Building Association News, Chicago.*

"THE CALIFORNIA ARCHITECT AND BUILDING NEWS for January comes to us in a new dress, and generally improved make-up, which renders it more acceptable than ever. It is always replete with valuable matter concerning the interests it advocates, and is ever an acceptable visitor, not only to the craft, but to those who desire to know whatever best applies to the most acceptable methods of architecture."—*Alameda Eneinal, February 3, 1886.*

IN a recent trip of the steamer *Burgos*, from England to China, during the first part of the voyage, from Plymouth to Alexandria, the consumption of coal was 282,240 pounds, the distance being 3,380 miles; the consumption per mile was, therefore, only 83.5 pounds, and the consumption per ton of cargo per mile, 0.028 pound; in other words, half an ounce of coal propelled one ton of cargo per mile.

Quarterly Review of Building Activities.

ALTHOUGH the figures presented in this article show considerable decrease in building activities as compared with the third monthly report of last year, and the quarterly report ending March, 1885, there is a good feeling among all classes of real estate owners, and very many express the intention of early commencement of new improvements.

Except among the chronic croakers who fail to discern a single ray of light even at noonday, confidence in future building movements is freely expressed, and at the slightest impulse or inducement a moderate, if not vigorous, boom in building is likely to start up. There is but little let down in the rates of rentals, and the number of vacant houses, stores, etc., is by no means large, nor nearly equal to what it has at times been in San Francisco, notwithstanding the rapidity with which new buildings have been erected within the past five years. Nor is the demand at all likely to diminish, with the increase of population steadily going on by natural augmentation from marriages and births, and the settling down upon this coast and in this city of tens of thousands who prefer the genial climate of California to the cold, frozen, snow-bound, blizzard-desolated sections, where not only common personal comforts are jeopardized, but life itself, to a certain extent endangered.

REPORT FOR MARCH, 1886.

87 Frame Buildings	Value,	$311,055
2 Brick "	"	26,200
12 Alterations, etc	"	21,830
101 Total value for March		$359,085
Total for January, 1886, as previously reported,		623,250
" " February, " " "		377,197
Total first quarter, ending March 5, 1886		$1,359,532

NOTE.—The quarterly reports in this journal being made in its third, sixth, ninth, and twelfth issue for the year, and the day of issue being the 5th of each month, December of each preceding year is made a factor in the respective reports.

January, 1885.— 73 buildings reported				Value	$590,150
February, " —121	"	"	.....	"	608,850
March, " — 97	"	"	.....	"	768,750
Total first quarter in 1885					$1,967,750

The above figures show a falling off from the first quarter of 1886, as compared with the corresponding quarter of 1885, of $608,218. But this scarcely represents the actual condition of the building interests, as the grading work of the Flood Building, corner of Market and Fourth Streets, is under way, but not included in the above, and the figuring for the other —constructive works—is in progress as we go to press. The total cost will reach in the hundreds of thousands of dollars, and will be a large item in the report for April.

The Nightingale Building, Market and Franklin Streets, is also under way, and only $11,504 of its cost included in the report of this month, whereas its total cost will be several scores of thousands of dollars.

In further modification of the foregoing figures it may be stated that the engagements for present quarter include but four over $50,000 each, to wit: one of $130,000, one $90,000, and two of $80,000 each, or a total of large jobs of $380,000; while for same quarter in 1885, there were reported two of $300,000 each, one $80,000, one $90,000, and one $53,000, a total of $823,000—a difference of $443,000 on large jobs, which would place the quarter of 1886 only $165,218 short of 1885 on residence, tenements, and the general class of buildings, so that, with the several large jobs approaching contract, it is altogether probable that the semi-annual showing for 1886 will equal that of the preceding year.

Other prominent buildings than those mentioned, upon which work has been actually commenced, but which, as a whole, have not matured into contracts for the whole work, will swell the future reports for the year sufficiently to overcome the shortage thus far reported.

There is also considerable activity in smaller constructions, and many of the architects' offices are "full of work."

ACCURACY OF BUILDING REPORTS.

The reports made in this journal are more nearly correct and reliable than any other. The attempt of some of the daily papers

to manipulate building reports do not represent actual facts. Engagements are sometimes *repeated*, and, for appearance sake, cases reported by this journal two or three months previously, are utilized to "make a respectable showing." It will be found by comparison that the weekly reports of a daily contemporary which pretends to supply its readers with reliable information, that while for the month of March, including the four weeks prior to date of present publication of this journal, said journal reports a total of 62 buildings at a total cost of $341,600, we give, for the same period, 101 engagements, at a total of $359,085. Difference in number of engagements, 39; difference in reported cost, $17,485, thus showing that our contemporary, with its 39 buildings less, reached within $17,485 of the total cost of our 101. This, if the *weekly* report of building intelligence represented the facts as to actual cost of the 62 buildings reported, the additional 39 buildings reported by us would cost but $17,485, or an average of less than $450 each, which is not a fact.

The reports from Oakland, San Jose, Sacramento, Merced, and other places outside of San Francisco, are light; but this may be accounted for by the heavy rains of the season, which renders building operations outside of cities difficult, if not impossible.

The Present Great Question in California.

WE have so frequently and plainly stated our position upon the Chinese question that no one who reads this journal should mistake or misunderstand our views. From the days of its infancy, until now, there has been but the one sentiment expressed in these columns,—that of absolute opposition to the Chinese as part of the population of the United States. The record will show that long before many of our contemporaries on this coast yielded to the power of argument existing in the actual, living facts of the case, this journal contained and expressed earnest and honestly conceived and believed convictions that the Chinese were in every sense an objectionable and undesirable element in social and business life in California; that not only labor was demoralized, and wage-earners of Caucasian blood debased and injured, but that manufacturers and producers of every class were being crowded to the wall, and that it was only a matter of time when the manufacturing and monied interests of the country would feel the pressure and begin to cry out for relief. That time has come, and from one end of the Pacific Coast to the other the sentiment expressed tallies with those to be found in the early numbers of this journal.

California Architects Inactive.

THE Chapters and Associations of Architects in the Eastern and Western States seem to be alive and engaged in earnest work, not alone in personal interests, but to all the great issues and matters involved in and relating to the more perfect, enlightened, and intelligent practice of the profession, to a fuller and better understanding of the innumerable features and principles of construction, and the endless involvments that surround and are interwoven in the study and delineation of the science of architecture.

The architects of these extreme Western States, however, seem at ease, content with the pursuit of individual success, leaving the profession, outside of personal practice, but little cared for. True, the sessions of the Chapter are held monthly, and a certain amount of routine work is done, and many excellent things *contemplated, projected, and proposed*, but for the want of *earnest workers* but little is accomplished. In all matters of general interest there must be hearty and united co-operation and determined effort to produce results of any value. It may be that we of the Pacific Coast know it all—each for himself; but more probable that a stirring up of matters, and delving after facts, figures, and secrets, at present unseen, would reveal something worth knowing. This will come to pass when the restrictions of individualism and personal views and ideas yield to a broader and more general spirit of advancement and improvement.

Important to Contractors and Owners; Lien Law Issue.

SECTION 1183 of the Mechanics' Lien Law provides that all contracts amounting to one thousand dollars and more shall be "filed in the office of the County Recorder," etc., "otherwise they shall be wholly void, and no recovery shall be had thereon by either party thereto; and in such case, the labor done and materials furnished by all persons aforesaid, *except the contractor*, shall be deemed to have been done and furnished at the personal instance of the owner, and they shall have a lien for the value thereof."

The validity of the above piece of special legislation is likely soon to be tested under the operation of the provisions of the lien law—*special* in that it discriminates against contracts for building and constructive works, etc., and not against contracts in general for similar amounts. Hence its application is *special* and *discriminating*, and consequently unequal and unconstitutional; and further, *special* in character, as it is well known that the above and other amendments were manipulated and put through the legislature by certain influences, for *special, personal considerations and interests*, violating all principle of law and equity in the creation of *preferred creditors*, first, in securing to workmen their pay, which is reasonably right and proper; secondly, making the material man the next in order of payment, leaving what balance of contract money there may be to be divided among the sub-contractors—stair-builders, painters, plumbers, plasterers, bell-hangers, etc.—the latter, if there is not enough left to pay them in full after the workmen and material men are paid, are compelled to accept such percentage of their claim as the unconsumed balance of contract money will give them.

The Supreme Court, however, by a recent ruling has promulgated a theory and construction of the lien law which clearly indicates fatality to the foregoing, whenever the issue reaches that tribunal for decision.

The case giving rise to this article is that wherein an owner entered into a contract with a prominent and responsible contractor for the erection of a building, which was carried through to completion in a satisfactory manner, the stipulated payments having been properly made during the progress of the work, under the terms of the contract, signed by both of the parties in interest, but not "*filed*," as directed by the lien law, with the County Recorder.

The owner, by some means, discovering that the lien law released her from all further financial obligations to the contractor, by reason of the *non-filing* of the contract, although she had received and was in possession of his material and labor, declined further payment, because the law reads that "no recovery can be had by either party." Consequently, the contractor has no protection under the law to recover his rights, nor against the dishonesty of the owner to pay what she owed and had agreed to pay. An owner who receives building values and refuses to pay for them under any equitably right circumstances, should blush to make any pretense to honesty of heart or principle.

What though a legal farce, manipulated into a form of law, renders it possible for the obligator to escape his or her obligation, the moral aspect of the case furnishes no color of integrity in the party seeking shelter behind the flimsy subterfuge of an unrighteous law.

But, in the case in question, the biter will be bitten, as a score of liens have been filed, all of which are almost certain to result in judgment against the owner, and if each is prosecuted separately—as they should be for the purpose of enlarging the legal dose as much as possible, each carrying separate attorneys' fees and Court, trial, and judgment costs—it will require considerably more than the sum due as balance of contract money to settle all the claims.

Liens—Rights of Farm Hands.

SINCE the publication of the Mechanic's Lien Law in book form, by this journal, we have been called upon to answer numerous questions. Among others, "Have farm hands the right of lien on the farm or lands upon which they perform labor?" We find no special provision for such cases. If the labor performed is in the building of fences, the erection of sheds, barns, houses, or constructions of any sort, a lien thereon will lie under the general lien law; but the only recourse for wages for usual, ordinary farm-hand labor is as found in the book referred to, which contains all lien law enactments in this State.

EDITOR CALIFORNIA ARCHITECT:

Dear Sir—In your article, "Profits on Building Contracts," appearing in the last number of the CALIFORNIA ARCHITECT, you endeavored, if I understand it rightly, to set up the theory that contractors, as an average, get nothing out of their contracts, or at most their profits are very small. To a certain extent, perhaps, you are right, but permit me to suggest to you that such results are, commonly speaking, the experience of all business men. The losses that occur from time to time, through bad debts, depreciations, fluctuations, etc., are such that the final results of each year, particularly during years of light trade, so far eat up the profits that should be that merchants, manufacturers, producers, and dealers generally often find themselves but little better if not worse off at the end of the year than at the beginning.

I query, therefore, whether in your otherwise well-written and interesting article, you have not strained points a little to make out a case. True, there is nothing unusual or surprising in the fact that the building business is at times to some unprofitable, as it is but a common experience with all businesses. You theorize well, and are right in many of your conclusions, but you make a mistake in applying them specially to the contracting business. MERCHANT.

In answer to "Merchant" we reply that his criticisms are very like the scrutinies of the men in the contracting business, who, by their short-sighted errors in figuring, establish the condition of things set forth in the article referred to, *i. e.*, too limited in scope. He fails to comprehend the situation, or to take in and apply *all the facts*. It is true, as he states, that thousands of men run their business with but little average profit, and many find, by taking stock and balancing accounts, that the losses by failures and bad debts more than counterbalance the gains and profits. This is a usual and universal experience in all business operations where the *possibility of losses attaches*. If a merchant or dealer in any line of trade or commerce makes a lucky hit, and realizes a profit upon a month's transactions, amounting to one, five, or fifty thousand dollars, and the succeeding month, by failure of creditors, or unfortunate speculation, loses an equal amount, he is no better off than if he had done nothing within the time; or even worse than that, for current expenses necessarily would be greater in transacting a considerable amount of business than if no goods or merchandise whatever had been moved or handled; and with the gains and losses equal in the direct transaction, the wears and tears and incidentals would of course work an actual loss.

A STRONG POINT OVERLOOKED BY "MERCHANT."

While all as above stated is true, there is a material factor in the case which seems to have escaped the notice of our correspondent—that is, that the business contingencies of losses by failure of creditors, depreciation of values, unprofitable ventures, reverses in speculations, etc., do not exist in building contract operations. When a contractor enters into a contract obligation with an owner—presuming always that the instrument of agreement is properly drawn and signed—he receives in and by the document, a guarantee that secures him *beyond all peradventure*, against any possible loss, as far as the contract amount is concerned. The owner, by signing the contract, not only agrees to pay a certain sum of money for a specific purpose, but he virtually pledges and incumbers his land, as well as the erections to be made under the contract, as security for the faithful payment of the contract amount. This pledge and incumbrance may not be, and is not a direct, personal, voluntary act, but it is equally binding and secure, being made so by the laws of the State, to wit, the Mechanics' Lien Law, which stands unimpeached, and by the highest legal tribunal pronounced valid, as between owners and contractors, for the full amount of contract money; so that the latter is twofold secure in any contract undertaken, first by the owner's personal obligation and agreement to pay, and secondly in the sure and certain security provided by law in the land and improvements covered by the contract. Consequently, none of the uncertainties, contingencies, and risks that attach to general trade and transactions apply in the case of building contracts, as the full sum of contract *must be paid*, under any and all circumstances, by the owner, either voluntarily or from the proceeds of the sale of his lands and improvements, as by law provided. Contractors cannot, therefore, possibly suffer any loss as far as the sum of contract is concerned.

Hence the conclusions of the former article on the subject matter involved were and are correct; for contractors always receive the *full sum* of contract, except in isolated cases where, from a disposition of pure meanness on the part of owners, contractors submit to the *shaving* process in settlement to avoid lawing, or where the *shaving* has been done by the contractor, by imposing inferior material or workmanship, or both, and the owner rightfully refusing to pay without some abatement as an equivalent for the omissions and wrongs practiced.

Piecework vs. Subcontracts.

IT is argued by some that piecework and subcontract work are synonymous terms, and that in all cases of house construction, piecework is practiced in every instance of subcontracts. This is an erroneous and forced construction, viewed in the light of the common usage of the expression. Subcontracts, as a rule, carry with them the funishing or value of certain materials as well as labor. An original contractor may, and often does, include in his contract the erection of a building as an entirety; yet his special branch may be that of mason or carpenter. Consequently, it becomes a necessity that he segregate the several branches of the work, and sublet the same to those specially engaged in the respective departments; as, the mason work to a mason; the plastering to a plasterer; the plumbing to a plumber; the painting to a painter; the stair work to a stair builder; the bell work, glazing, etc., to those engaged in the several lines respectively, each and all of whom are supposed to furnish all necessary material for the respective purposes. But at the same time, the labor alone of each department may be made a matter of subcontract, and so far assume the character of piecework.

Piecework, as generally considered and understood, is an entirely different affair, and means the segregation and letting of portions of the labor at a stipulated price, instead of the same being done by regular day work. For instance: a contractor, to relieve himself from all uncertainties as to the cost of labor on any portion of the work, may let the same piecework, by agreeing to pay a party or parties a certain sum to erect the frame of the building; to put on the rustic or wall boarding; to lay the floors; to trim the house, *i. e.*, put up all the wainscoting, case and trim openings, hang doors, blinds, etc., and so cut off all labor-paid day wages, all of which means just two things: first, the contractor by thus piecing out the work, runs no risk as to the cost of the labor. Second, if the labor so pieced out is reasonably worth more than the sum agreed upon with the pieceworkers, and is less than the cost originally estimated and included in the contract amount, the contractor saves and pockets the difference, and the pieceworkers lose accordingly, compared with fair day wages, or they must put in extra hours per day, or work more incessantly—slavishly—to obtain usual wage rates of pay, or what is worse, slight and botch the work all that is possible, so as to drive through each day enough to bring them out even.

Another and serious feature of the case is that pieceworkers, as a rule almost universal, are inferior men and poor mechanics, men who find it difficult to obtain steady work by the day, either because of their mechanical inferiority, or a predominant disposition for killing time, and doing less than good hands willingly and naturally put through as a rightful duty to their employers and in justice to themselves as men; for a good and honest journeyman mechanic entertains pride both as to his mechanical executions and to his integrity for faithfulness as a man. But very few, if any, of the latter are found among the pieceworkers, who are looked upon as *rats* by the better classes.

But there is a class who rail out against pieceworkers, who are no better than those whom they decry, men who love to dictate and direct others, yet possess not the essential qualification of ability to guide, the most prominent feature of their make-up being their tongues, which they often use abusively and foolishly and to their own disgrace and disadvantage; as Æschines says, "A fellow whose tongue is his sole merit, like a flue, all there is in him, besides, were good for nothing."

Piecework has no other advantages than those mentioned—special benefits to contractors—while to it there are strong objections; for while work done under the system is sometimes fairly executed, it is never as perfect as if done by reliable, day workmen, and generally—seldom otherwise—it is poorly done, with every neglect and slight that is possible instituted so as to escape entire condemnation and re-doing. The pieceworker can have no other incentive than to make the most out of his bargain. His whole interest centers in putting through as much work as possible to augment financial results. To him, pride and satisfaction in the quality of the work cut no figure. When completed and paid for, his interest ceases, and he goes abroad to seek another chance to displace his superiors as workmen, by negotiating them out of employment as day laboring mechanics.

The Price of Labor in New South Wales.

IN the last number of the English *Engineer* is a paragraph giving the prices (in English currency) paid to various grades of mechanics in the colony of New South Wales. We have changed it into American currency, that a comparison can be made with prices that are current in the United States:—

WAGES PER DAY OF TEN HOURS.

Machine men in filing shops from	$2.00 to $2.80
Iron turners	3 53
Engine fitters	3 42
General fitters	2 82
Brass finishers	3 00
Iron moulders	3 23
Brass moulders	3 00
Pattern makers	3 00
Boiler makers	3 23
Coppersmiths	3 00
Blacksmiths	3 63
Blacksmith strikers	2 00

As a considerable, in fact the greater, portion of the manufactured

iron used in the colony is imported, persons desirous of obtaining employment in iron manufactories should be extremely careful in going to that country, the number of such establishments in New South Wales being limited. Handy mechanics, willing to make themselves useful, readily find employment, either in town or country, and generally do well.—*American Engineer.*

On Stair Railing.

Editor California Architect:

Notwithstanding the many treatises written by able authors on stair-building, from the period when the celebrated Peter Nicholson stood confessedly the master conceptor and delineator of the science of stair-building, down to the present day, there seems to have prevailed among the workmen in carpentry, a distrust in their ability to handle the many intricacies involved in stair railing, even over the commonest cylinder. This distrust exists even among the best and most competent workmen, and the great intimidating feature is railing work.

A thorough knowledge of the art of constructive joinery is imperative to perfect workmanship, with skillful and faultless stair work as the highest point of attainment in building sciences, a full and perfect understanding of which involves the necessity of a thousand lines and points of material value not required in carpentry or general construction.

The proper construction of stairs is an all-important part of house building to both architects and owners, as their daily and hourly use affords comfort and ease, or tires and distresses, as the case may be, according to the accuracy with which the true principle of stair-building is observed. Strength and solidity are also important factors, especially in stairs subjected to severe usage in the passage of safes, heavy trunks, and weighty packages, and in cases like that in France, where, by the falling of a stone staircase, the lives of scores of unsuspecting people were destroyed and a large number maimed and crippled for life, as a result of defective construction and the over-confidence of a thousand human beings who risked their lives upon a thing of beauty, which collapsed from overloading.

I think there are not more than three sets of stairs of similar construction to that just alluded to in the United States, the most notable and prominent of which is in the State House, Columbus, Ohio. Such stairs are supposed to be self-supporting, the wide ends of the steps being inserted in the walls of the stairway, and the cylinder ends and intermediate parts lapped and cut, locking the respective steps together, so as to provide a continuous strength to the entire construction.

The following diagram shows a very easy way of getting out stair rails over cylinders, 1 1 1 being the face of cylinder, 2 the center of baluster from which the tangents must be derived, and is, in fact, one of the most important points in the ground plan, for the reason that the rail is supported all around the cylinder on the top and center of the balusters.

Commence by making the tangent as shown; place half of the rail each side of 2 3 3; draw level tangent right and left indifferently; take the compass, stand on left, describe a curve from the spring line at 2, to cut level tangent at 5; do the same on opposite side.

The tangents being unfolded, set up the highest—say from 4 to 6 on the left; connect 6 and 5, which will give the tangent in the pitch; square out from 6 to 8, and stand compass in 6; open to 7, the center of cylinder; draw curve, cutting at 8; continue line 8 to 9, parallel with pitch 6 5; 8 9 then becomes the plane of the elliptic curve covering the pitch. The breadth of rail in pitch is next to be found, as shown by the illustration, carried up from 3 8, cutting pitch line.

The Art of Bricklaying.

THERE is an art—a mechanical science—in laying bricks. The handling of a trowel in picking up and spreading mortar, and placing bricks in walls, appears to the common observer as a very simple matter, at which any ordinary man should gain proficiency by slight practice. But this is a great mistake. To lay bricks skillfully and as they should be laid, is a mechanical attainment not acquired by some in years of practice. Thousands of bricklayers spend their entire lives in the daily use of the trowel without being able to execute a clean, neat job of masonry. The difference in individual proficiency is great, and from every gang of twenty workmen there may be selected some who stand head and shoulders above others as workmen, and whose easy and skillful handling of the trowel, and grace of motion points them out as the far better men. Such men, with the same or less expenditure of effort and labor, do as much or more than their inferiors as to quantity, and do it infinitely better. But where large forces are required the impossibility to secure a sufficient number of picked men, compels the employment of others whose services would be dispensed with but for the necessities of the case. The same features hold good as far as the bosses are concerned. It is often the case that men who are unqualified to properly fill the place of journeymen drop out of the ranks of the wage-earners and constitute themselves "masters," by which means they are enabled to conceal their personal mechanical deficiencies, and are a part unwarranted by possessed qualifications.

As the result of all this, and the low prices at which work is *too often* undertaken, and the further fact that there is so little earnest devotion on the part of many masters to acquire a thorough knowledge of the art beyond the experiences and customs of daily life, there is a vast amount of poor brick-work done; and the real *master masons*—men worthy the name—are made to endure the hardship imposed by competition with the lesser class, whose knowledge of the art of brick-laying reaches not a whit beyond the extent of their limited practical experiences.

These remarks are warranted by the facts known to exist in all cities, with San Francisco not an exception. The piling up of bricks in walls forming the outlines and shape of buildings is one thing, and the skillful manipulation of materials producing the same result is another. Pertinent to this, one of the technical journals devoted to brick-making gives the following general particulars to be observed in using brick material: 1. To reject all misshapen and unsound bricks. 2. To place the beds of the courses perpendicular, or as nearly perpendicular as possible, to the direction of the pressure they have to bear, and to make the bricks on each course break joints with those of the courses above and below by overlapping to the extent of from one-quarter to one-half the length of a brick. 3. To cleanse the surface of each brick and to wet it thoroughly before laying it, in order that it may not absorb the moisture of the mortar too rapidly. 4. To fill every joint thoroughly with mortar, taking care at the same time that the thickness of mortar shall not exceed about $\frac{1}{4}$ inch. In order to prevent the use of too great a thickness of mortar, it is usual in specifications to prescribe a certain depth which a certain number of bricks shall not exceed. For example, if the bricks are $2\frac{3}{4}$ inches deep, it may be specified that four courses of bricks, when built, shall not measure more than 1 foot in depth, a condition which implies that the average thickness of mortar in the joints shall be $\frac{1}{4}$ inch. 5. To use no bats or pieces of bricks except when absolutely necessary in order to make a "closure"—that is, to finish the end or corner of a wall, or the side of an opening—and even then to use no piece less than half a brick.

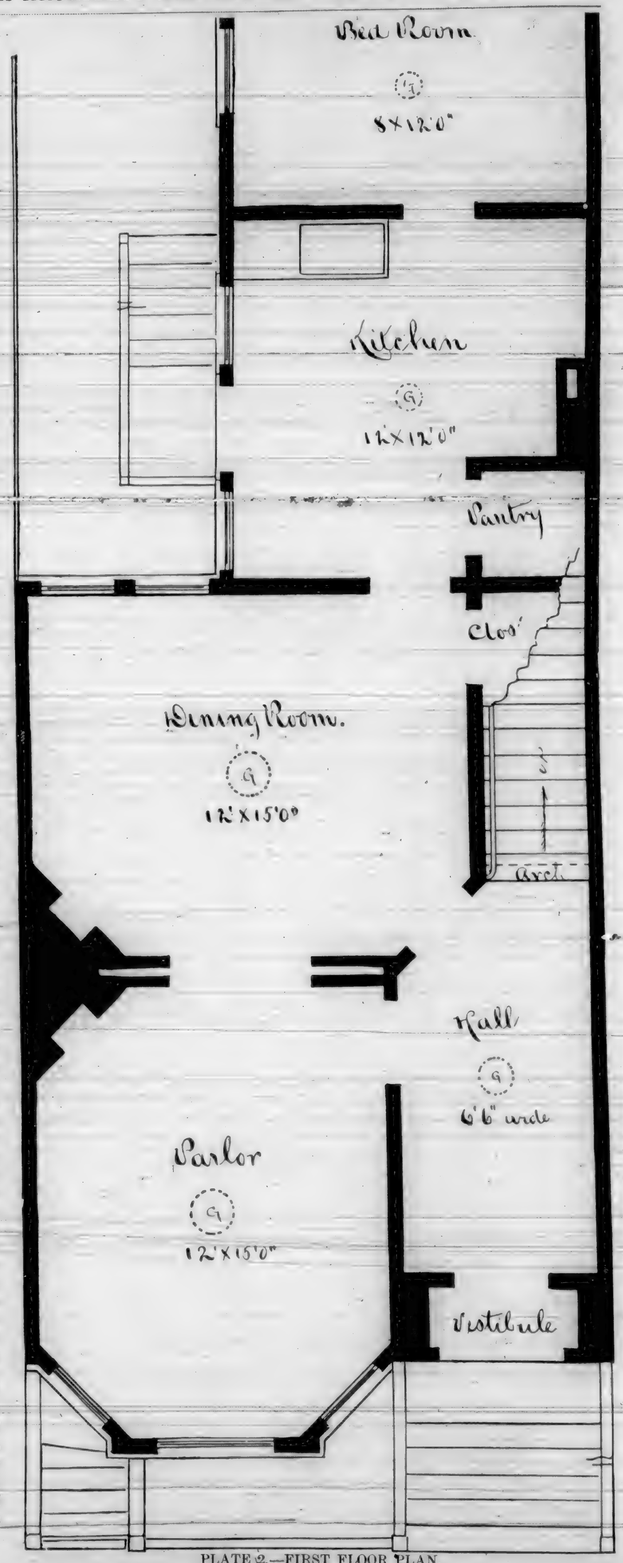

PLATE 2.—FIRST FLOOR PLAN.

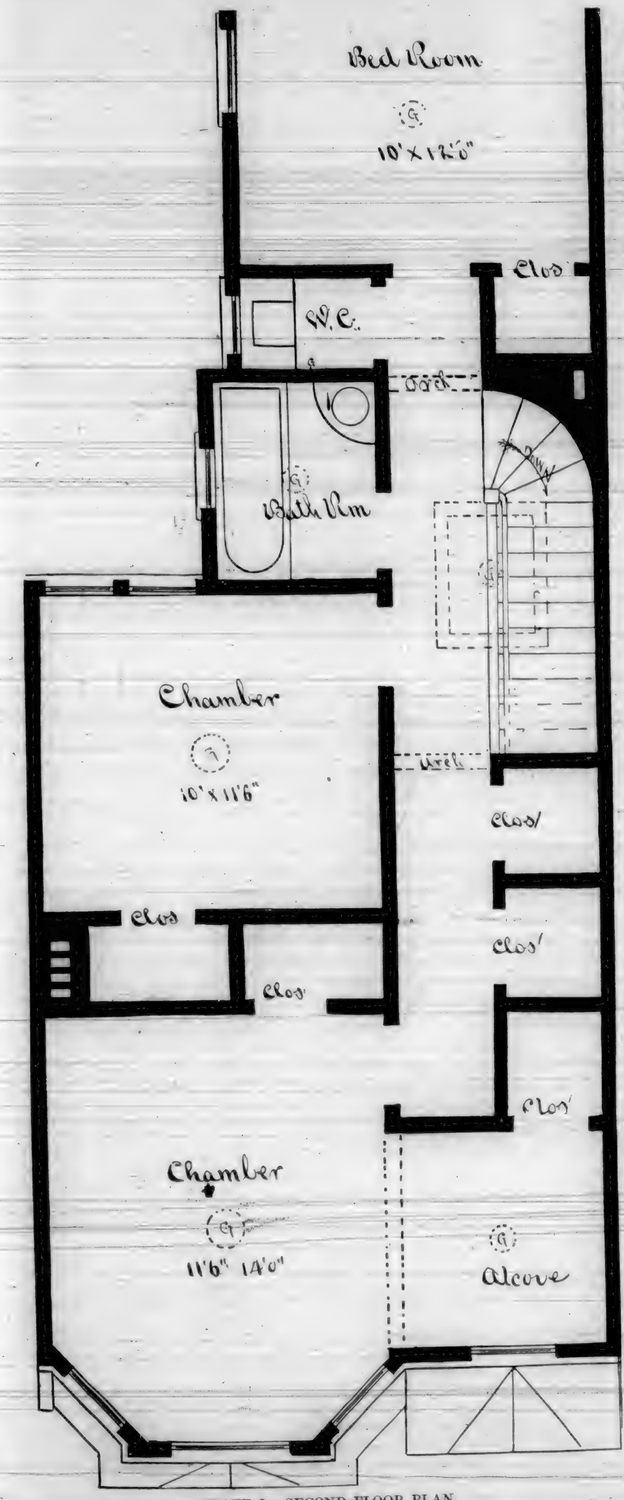

PLATE 3.—SECOND FLOOR PLAN.

A British Mansion.

A LATE issue of the London *World* contains the following interesting description of one of the handsomest and most elaborate mansions in Great Britain: "The rebuilding of Mountstuart, Lord Bute's place, near Rothesay, has now been completed, and it is one of the most magnificent mansions in Great Britain. The house covers an acre, and is in the mediæval Gothic style of the thirteenth century. The walls, turrets, and balconies are built of stone brought from a quarry in Kirkcudbrightshire. In the center is an immense tower 120 feet high, with a wide balcony all around the top. The great hall is constructed entirely of alabaster and the rarest marbles, with columns and a gallery, and the grand staircase is also of marble brought from Sicily and Carrara. The drawing-rooms are paneled with walnut and beautifully decorated, and so are the dining-rooms, the largest of which accommodates eighty guests. The ceilings and chimney-pieces of all these rooms are most artistic, and so also are the windows, the work of which is extremely elaborate. There are three immense libraries and a billiard-room, all with carved stone fire-places of antique design.

THE estimated copper production of the Lake Superior mines for 1885 gives the following figures: The total production of smelted copper was 71,150,000 pounds, 1,850,000 pounds more than the product of 1884. The Calumet and Hecla produced 47,100,000 pounds in 1885, against 40,473,585 in 1884 and 33,125,155 in 1883. The Quincy Mine product was 5,839,428, or 160,000 pounds more than in 1884. The Franklin comes third and the Atlantic fourth.

THE Northern Railway of Russia is using peat as fuel to a great extent, and saves half the cost of wood or coal by the operation. The peat is found chiefly near Moscow, and is cut mostly by steam machinery, which can penetrate to a depth of twenty feet from the surface of the bog.

THERE are 5,500 sets of telephone instruments connected with the telephone exchanges in the city of New York, besides some 600 private-line instruments. It is estimated that 50,000 conversations take place over the wires of the metropolis every twenty-four hours. For each message there must be at least five "Hellos," which would make 250,000 "Hellos" going over the wires daily in New York.

AN ORIENTAL CANTILEVER BRIDGE.—A letter from Yokohama, Japan, bearing date October 6, gives the following description of an old bridge constructed by native engineers. The writer evidently shared the popular, but erroneous, impression that engineers had urged the claim of novelty in the cantilever principle. The following is the description *verbatim:* "At the sacred city in Nikko, the other day, I was rather amused and interested at seeing a fine and very costly bridge of cantilever construction—abutments of hewn stone, shore piers, hewn granite, octagonal, monolithic, mortised for stone girders; monolithic plate beam to receive wooden superstructure. The stringers are fastened into the abutments, balance over the stone beam, but do not reach, by considerable distance, the gap being fitted by middle stringers let into the shore stringers. The Niagara bridge is a mere amplification of this one, built before America was settled, as a religious duty, very expensive, of thick, red lacquered work, and, like a bridge of angels, its planks are never profaned by the feet of the laity. But it seems queer-like, to come away here to find our new inventions very old."—*Van Nostrand's Magazine.*

NO WOMAN can lace herself so tight as a man can drink himself.

Science of Architecture.

[Special for this Journal. By F. HILLERT, Architect and Mechanical Engineer.]
(Continued.)

BY ventilation we understand the renewal of the air in a closet room. This is accomplished by the conveying of fresh air to, and carrying off of the spoiled air from the same, which is either done by voluntary and self-acting ventilation through the permeability of the walls, and its doors and windows, etc., without any separate arrangement, or by special arrangement. Of the latter and its action we will only speak.

The foundation for the calculation of a ventilation arrangement is the finding of the amount of air, for every hour, which has to be admitted, respectively discharged. The air in the room is spoiled by: (1) the respiration and transpiration of men and animals, (2) lighting of the room, (3) smoke and dust, (4) mechanical and chemical processes developing gases. It can be assumed that a grown person, for every hour, breathes out 0.020 cubic meter (0.72 cubic feet) of carbonic acid gas; one burner consuming 0.140 liter = 0.140 cubic meter = 5 feet of gas, burning with a capacity of 7.8 candles, making 0.093 cubic meter (3.32 cubic feet) of carbonic gas; good air suitable yet for men to live must not contain more than 0.7 volume per cent of carbonic acid gas. The creation of heat by one person is 130 cal., and by the combustion of 1 cubic meter of gas 8,060 units of heat are produced.

From this information can be calculated, for certain cases, the amount of air which has to be conducted into a room for every hour, to retain the same at a certain temperature, respectively, at a certain state of purity, certainly only under the presumption, in accordance with our present state of knowledge, that, besides the carbonic acid contained in the room, the other exhalations and impurities stand in the same ratio with the respired carbonic acid. This will not be always the case, and, therefore, for different purposes different quantities of air are to be taken into account. The following table furnishes the air quantity for one person for one hour required for different purposes:—

	CUBIC METER.		CUBIC METER.
Hospitals	70	Common Workshops	60
Surgical Operating Rooms	80, 100	Unhealthy Workshops	100
Halls for Contagious Sickness	150	Concert Halls and Theaters	40, 50
Prisons	50	Meeting Halls	60
House of Correction	20	Schools for Children	15, 20
Barracks (Nights)	40, 50	" Grown Persons	30, 35
Stables	180, 200	Evening Schools	35, 40

For rooms to live in, 10. to 20 cubic meters are sufficient for each person, but since the number of them will always vary, or cannot be decided beforehand, we can take, commonly, for an hour's change of air a volume equal to 1 to 2 times the amount of the cubic contents of the respective room. The letting in and taking out of the air, that is, the motion of the air, is always produced by disturbing the equilibrium of two air columns, either by warming respectively, by cooling off of one of them, or by reducing or increasing the pressure of the air column by the forcing in or by driving off of air by machine apparatus. The renewal of air by difference of temperature is named "natural ventilation," the one produced by machine, the "artificial ventilation."

1. VENTILATION BY DIFFERENCE OF TEMPERATURE.

If we connect both ends of a vertical or inclined channel with the atmospheric air, the same will remain at rest as long as the temperature of the same is equal to the atmospheric air temperature. If the air temperature in the channel becomes lower, then, by reason of its larger density, the equilibrium in the channel is disturbed, and the air in it will take a descending motion; but if the air should become of a higher temperature than the atmosphere, the first will be displaced by the latter and an ascending motion is the result. On those physical proceedings depends the ventilation by the difference of temperature.

The simplest arrangement for this system of ventilation consists to give to the room either only one channel for the admission of fresh air, or one for the leading off of the spoiled air; the leading away in the first instance and the admission in the second is done partly by the untightness of the surrounding walls, or by opening of doors and windows at times. This manner of ventilation is not rational, on account of the small and very irregular effect, by the producing of the unavoidable draughts, which, when only one discharging channel exists, is disagreeably felt at the window, and by opening of the door. We find, in execution, this arrangement mostly applied in those instances where, at the commencement of a building, the ventilation was not considered and afterwards introduced, or when unimportant rooms are to be ventilated, and when the above disagreeabilities are of minor importance.

The practical arrangement of a ventilation based on the difference of temperature consists of the entering of the outside air through channels into the rooms to be ventilated, and for conducting away of the spoiled air to above the roof, by protected channels. As long as the air in the room and in the channels is warmer than the outside air, there is a constant motion of air through the room to above; as long as the air in the rooms and channels is cooler than the atmospheric air outside, a constant setting motion of the latter in the channels and through the room, is going on. The first instance will happen through the winter period of the season; the second, in a limited manner, during the summer-time, that is, as long as the walls are capable they withdraw heat from the room, or if, for single cases, perhaps, regardless of wet, ice or water is applied, to cool and freshen the air in the room. The supply of fresh air can be arranged for the winter season for each room direct from the outside, which is not recommendable, on account of the irregularity of the source of supply by the action of the current of wind. It is best to take the air for many rooms by a common supply channel, whence the same can be branched off and distributed to each room separately.

The supply of air is taken through a channel placed in a sheltered position against dust, rain, and snow, a few meters above ground. Since the wind bears a considerable influence on the measure of ventilation by the pressure of the wind against the column of air in the channel, a densing, or, by suction, a thinning of air is produced, and care should be taken, by the arrangement of the air channel, that the action of the wind pressure should be made useful for ventilation, and the action of the suction be made harmless. It is recommendable to take the air from two different points of the compass, and according to the direction of the wind, the one or the other of the entrances should be used.

The execution of the horizontal air channels must be a careful one, that to the entrance no moisture from the surrounding ground find egress. The cold air taken from the outside should, before getting within reach of persons, be warmed to the temperature of the room. The warming can be done either in each room separately, on the heater placed in the room, or, for many rooms together, by a separate heater. In the last instance arrange as with air heating, the heating apparatus in the basement, and conduct the warmed air by perpendicular pipes to the respective rooms. With the heating of the air in the basement, an increase of the ascending motion of the air is produced, the warmed air becoming lighter than the cool air. This is an important fact, expressly for rooms located in the upper stories.

The warming of the air brings with it a reduction of the relative moisture; it is therefore necessary for all ventilation arrangements to increase the moisture of the air by the evaporation of water. The conducting channels are best placed in the middle and not in the surrounding walls of the building. The discharge from the same into the rooms can be concentrated, placed under the local heater, but better, when possible, when the outlets are distributed in as many places as possible, that the most uniform distribution of the fresh air is obtained. Care must be taken that the admitted air does not become disagreeable to the persons in the room, creating a feeling as if exposed to a draught. The discharging channels, likewise to be located in the middle walls, are to be conducted each by itself to above the roof, and to discharge the air below the roof, and give to the space below the same a corresponding outlet. Or unite the outlets in groups on the floor roof and conduct the air by a common channel to the outside or above the roof. The last arrangement is the best. To empty the air below the roof is not advisable, as in cold climates the snow lodged on the roof will begin to melt, and damper exists to the roof timber when a portion of the moisture contained in the discharged air is condensed, lodging on them and in the space below the roof (attic).

In the rooms itself the opening for discharging air should best be located close to the floor, as also close to the ceiling; the outlet above the floor serves, by normal temperature, to conduct away the heavy air, richly saturated with carbonic acid gas; the outlet under ceiling, by a high temperature, to discharge smoke and the products of combustion from burning gas light, etc. The openings for discharge should be many and in different places. For the calculation of the size of the channels use the formulas therefor given for air heating. With the above described arrangement for ventilation, based on the difference of temperature, it is only required to know and consider the difference of temperature of the rooms to be ventilated and of the outside air.

By heating of the air in the admission or in the discharging channels, the change of the current of air can be increased and hastened. So soon as the air in the admitting channel is heated above the temperature of the air in the room, we obtain in the same time an increased warming, and the whole arrangement will be hot air heating, mentioned before. Therefore, there remains only to be considered the ventilation by difference of temperature, where the discharged air is heated. This system of ventilation may be known under the name of aspiration system. The warming of the air to be drawn off can be done by a gas jet or any other special heating apparatus, either for each channel (discharging) separately, or all in common by being united before. The warming of each discharging channel by itself is, when many rooms are to be ventilated, rarely applied, and mostly only then when for some single rooms a more powerful ventilation should be desired. In most instances, and for larger establishments, it is better to warm the air to be discharged together. The uniting of the discharging channels of many stories can be arranged in many different ways; either, as before said, the channels are conducted to the attic, and there united to a common channel, or the channels are conducted in the ceiling of each story in a horizontal direction to a common ventilation channel, or the discharging channels are conducted, instead, perpendicularly up, and down to the basement, and then empty together in a horizontal collection channel to be conducted hence by a common ventilation channel to above the roof.

Under the same conditions the first arrangement is, in execution, the simplest, but in effect the most unfavorable; the second is frequently impossible of execution on account of the distribution of the building itself, but in effect the best; the third has the best chance of execution, and its effect ranges between the two former, *i. e.*, when the effect is considered identical with the larger velocity of the air to be obtained. The latter in execution is the most adapted and employed.

The heating of the air with gas is, for large establishments, very expensive, and therefore seldom used. To a fire-place or a central heating in existence, as a rule, the heat of the escaping fire gases is used. For this purpose the chimney is made either of wrought or cast iron, placed in the ventilation channel or shaft, and conducted high above the roof. For the summer season, arrangement for a separate grate fire is made, which conducts its fire gases direct to the smoke stack. When the escaping fire gases of an existing fire cannot be utilized, the arrangement of a smoke stack with a separate fire for warming of the discharged air is, economically, not much more recommendable or preferable than are separate air-heating oven steam heaters or hot water spirals.

The ventilation shaft, as well as the smoke stack, ascending in the first above the roof, should be supplied at the outlet with an air or smoke suction, and the ventilation shaft, by the use of an iron smoke pipe, should be supplied with irons for ascending for the purpose of controlling the latter.

In the execution of the horizontal collection channels, care is to be taken that all passages of the vertical discharge pipes, as all widening of channels, are made gradually; the execution in general is, besides, the same as those for the channels of air heating.

For the arranging of an "aspiration" system it is required to calculate the actual velocity of the air in the discharging channels correctly, as nearly as possible; therefore the following formulas will serve, applied under the supposition that the air in the channels has a uniform temperature, the channel itself has a quadratic or circular section, and that all changes of direction and section are gradual.

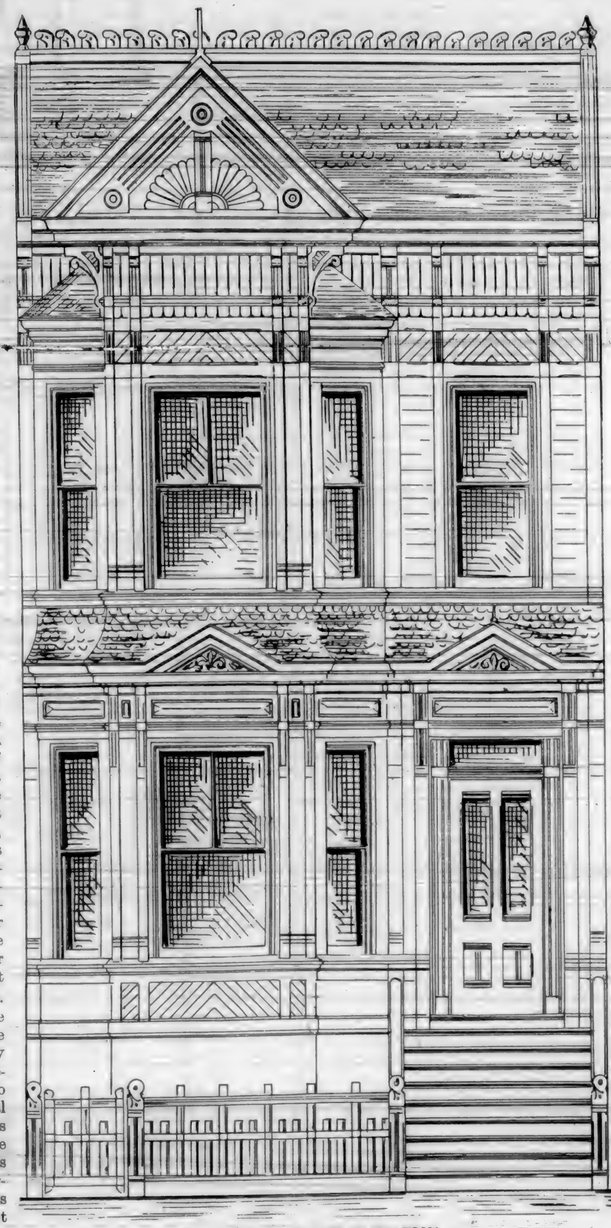

PLATE 4.—FRONT ELEVATION.

San Francisco Chapter of Architects.

THE regular monthly meeting was held February 5, President Curlett presiding, B. E. Henriksen, secretary. Succeeding roll call and approval of minutes of previous meeting, committee reports were next in order. Mr. Sanders regretted the lack of interest on the part of young men, students in the profession, to avail themselves of the opportunities at their command, through the instrumentality of the Chapter. The several classes organized are free to all young men engaged in the offices of members of the Chapter, and it seems strange that even any *one* student should be indifferent to the advantage possible through the system of class instruction, organized as part of the Chapter work; yet there is a lack of interest manifest on the part of some of those most to be benefited, which speaks less to the credit of the ambition of students than if the desire to utilize every auxiliary to useful improvement was emphasized by punctual and regular attendance at any meeting of the classes.

A communication from the Brotherhood of Carpenters and Joiners of America was read, setting forth the complaint that piecework was being permitted on certain buildings under the superintendence of a member of the Chapter. The subject-matter of the complaint being one over which the Chapter could exercise no control, no action was taken.

The same question was presented to the Chapter some two years or more ago, and received due consideration; and by unanimous vote, the Chapter expressed its disapproval of the system of piecework, but passed no law or rule making it an offense should any member permit departure from regular day labor on constructive works under charge.

The discussion of the sewerage and drainage question was to have been led by Mr. Macy, but that gentleman not being present, the matter was taken up and commented upon generally by the members present. Various suggestions were made as to causes and effects, and some deservedly severe strictures upon the character of construction of street and side sewer work, showing a criminal degree of negligence on the part of those controlling construction, and a weakness, if not dishonest disposition on the part of those who by contract pledge and agree, and are paid to do good work, with good and proper materials, but who substitute inferiority in both workmanship and materials, and consequently construct defective and faulty—instead of what should be, solid, durable and safe—sewers.

The appointment of tailors, shoemakers, beer drinkers, etc.,—men wholly unfit for the position as superintendents of construction,—received rebuke in plain terms.

The meeting was one of great interest. The number present, although not as it should have been—two-thirds of the members of the profession in San Francisco, Oakland, and San Jose—was good, and the proceedings animated and full of interest.

The application of Mr. Seadler, of Sacramento, for membership in the Chapter, was acted upon adversely to the admission of the applicant.

Chicago Soil.

THE *Sanitary News* reports a discussion at the monthly meeting of the Illinois State Architects Association upon the "Bearing Capacity of Chicago Soil," from which it appears that the "bed of blue clay found underneath the layer of loam, and the yielding muck beneath the clay," constitute the formation on which the city of Chicago is built. The clay when dry is "hard and very good for foundations, but when wet it is softened and difficult to treat." "Beds of streams and small rivers run through this stratum of clay," which seem to add to the difficulties of foundation work in certain sections. The fact that this clay is hard and solid when dry, and soft and yielding when wet, renders the study of foundations an important and first essential for architects in planning the erection of buildings in Chicago.

SAN FRANCISCO SOIL

Is much more reliable, as a rule covering all the original layout of the city—the formation being either sand, solid clay, or rock. As a matter of course, the rock-beds must be placed first in the rank of secure formations. Next in order is either the original sand or clay beds, either of which are good, many preferring the sand to the clay. For bearing purposes, when held immovable in position, sand—although in Bible history made to appear as a very treacherous and unreliable under-support for houses—is recognized in this city as safe and sure, unless by wind or water disturbed. The filled-in portions of the city, north, east, and south, will require the solidifying manipulations of centuries to become equal to the original land.

Architects and Draughtmen's Register.

FOR the accommodation and convenience of all parties—practicing architects requiring help, and draughtmen seeking employment—a register is kept in the office of this journal, for the registering of the names of unemployed draughtmen, without any charge, cost, or expense to either party. Draughtmen out of work will do well to enter their names, as orders frequently come to us, "Send us a draughtman." The register is always accessible to architects, and they are at perfect liberty at any time to call and examine list and make selection; or we will, with pleasure, furnish the names of those registered.

THE EFFECT OF ASPHALT ON WORKMEN.—French laborers who work barefooted on asphalt pavements are subject to swelling of the legs, which has been attributed, says *Iron*, to the vaporization, by the heat of the feet, of a small quantity of the petroleum or mineral oil which is contained in the asphalt. The nerves of the feet, which govern muscular action and the contraction of the blood-vessels, form an extensive and very sensitive, nervous network under the arch of the foot, where the skin is always thin, and the nerves are consequently easily affected. In England, workmen on asphalt wear list slippers, and the swelling of the feet has not been noticed.

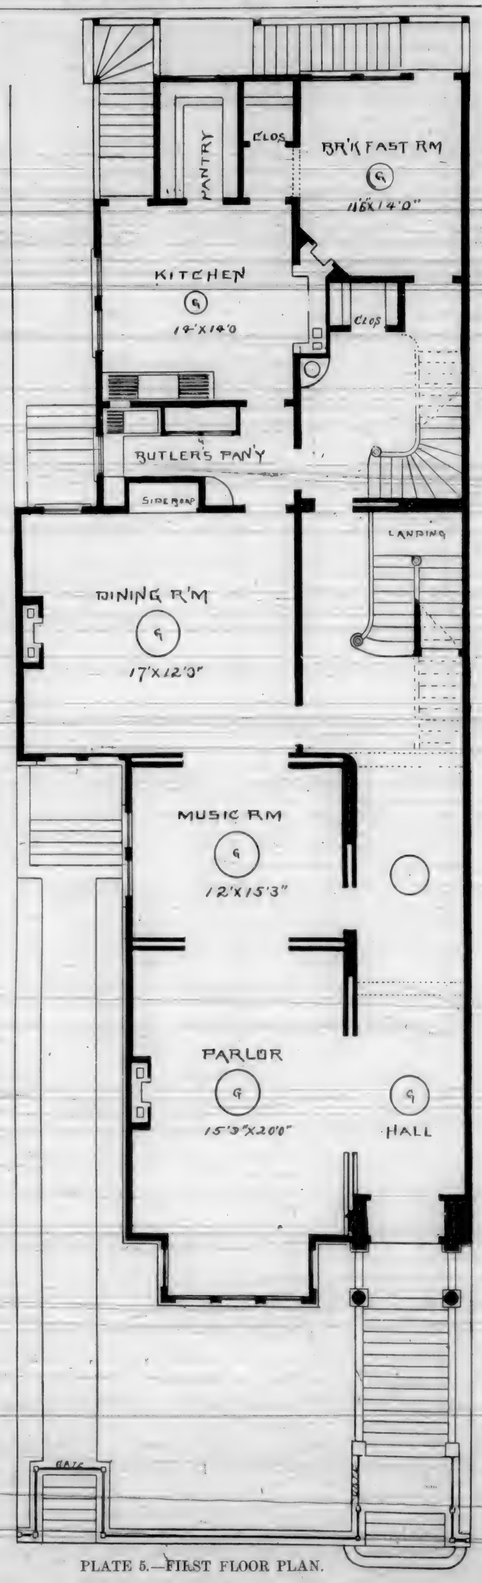

PLATE 5.—FIRST FLOOR PLAN.

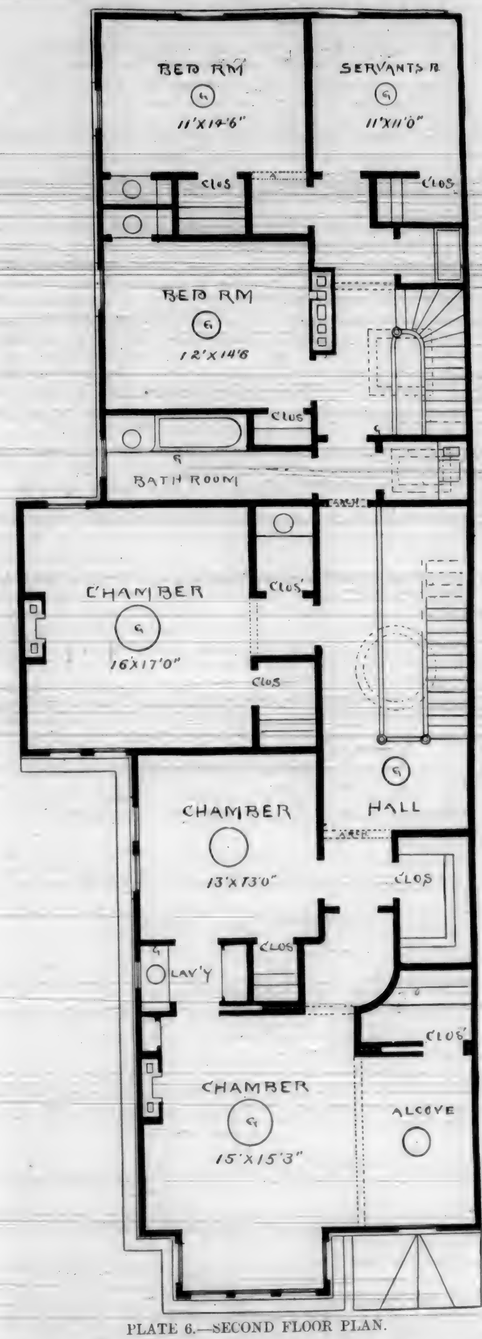

PLATE 6.—SECOND FLOOR PLAN.

CONSIDERABLE trouble is being experienced by the Chartiers Gas Company, of Pittsburg, in laying its pipes along some of the thoroughfares. The gas and water pipes already down are so numerous and close together that the street railway tracks are torn up to make room for putting down the new pipes.

BENJAMIN BAKER, an English authority on bridge building, says Americans are far ahead of the British in bridge building; that America is indeed a paradise of mechanics, and that the practice in this country tends to the production of better bridges than in England.

California Shingles.

THE shingles used in San Francisco and adjacent counties, and in all counties bordering on the Coast Range, and localities adjacent to the redwood belts, are exclusively sawed redwood shingles; in dimensions, $\frac{3}{8}$x4x14 inches. As in all other things, they vary in quality, with a market standard of No. 1 and 2, the latter consisting of those more or less sappy, and otherwise not sufficiently good to be classed No. 1, except for temporary purposes. The purchase and use of the second quality is decidedly unwise, as the sappy portions of the wood, either in shingles or in contact with the ground or moisture under any circumstances, soon perish and rot.

There is also difference of quality in the No. 1 quality, as some manufacturers turn out much better shingles than some others, with no better stock in the rifts to produce from. Some of the brands run of equal thickness, regular widths, square butts, and full points, while others lack these important characteristics, and are prolific in "swallow tails"—tapering points—and many of these slivered and rendered wholly unfit for full course work, as not more than one-half or two-thirds of the shingles are good in shape and thickness; and if "nigged" in after the custom of the full-fledged shingle layer, early leakages are sure to develop. For while 16 inches long is the supposed length, and 14 inches or less the actual average measurement, and 4½ inches the rule for weather exposure, then where the slivered and short pointed shingles occur, there cannot be full more than one lap or covering, which is not sufficient, except for sun-shade roofs, as a crack occurring in an upper shingle, over an under joint, or a corresponding split in the lower course, would inevitably open an inlet for the waters of every shower or storm during rainy spells.

In redwood trees, as in all other timber growth, there is difference in the grain of the wood, some being "nice," "first-class," others softer, and some hard and brash. The latter is the more objectionable in redwood shingles; those made of this kind of wood are liable to warp, and more apt to split from natural causes, or by the pressure of the foot in walking over them; although in the matter of wear and tear by the action of time and the elements, they are the more durable, as the moisture does not so readily enter the pores, and decay is the longer resisted.

As to durability, redwood shingles certainly have a fair claim, as, although the average thickness of the butt is less than $\frac{3}{8}$ inch, there are roofs now in use in this city which were put on twenty years or more ago, and are still rain tight, with no care looking to their preservation; while others put on more than a quarter of a century since, receiving occasional coats of paint, are in perfect condition, and are likely to remain so for a decade longer, if not for a period of fifty years, provided they receive the attention in paint which should be bestowed on all shingle roofs; for while paint preserves and protects the wood from the action of the elements, it also prevents the accumulation and growth of the greenish, semi-vegetable formations which invariably gather on the shaded, moist sides and sections of roofs in California.

Values and Equivalents.

EQUIVALENTS, as a rule, are regulated by real and actual values, demand and supply being easy, with neither excessive or unduly stimulating. This rule of valuation applies with equal force to everything exchanged or exchangable for money, whether of material, physical, or mental character. The personal, manual toil and service of those who work and strive through the years of life, with scarce a rational aspiration above and beyond the trammels of conditions in which by birth and inheritance they were placed, alike with the mind and mental labors of those who traverse the innumerable gradations of intellectual pursuits, as well as houses, lands, goods, merchandise, gems, jewels and everything namable, comes under the rule, with special advantage to those only who hold superior and commanding positions or exceptional qualifications.

Quality, as a matter of course, is always a material factor, unless stress of necessities compels the acceptance of the inferior for the better at any cost. Force of circumstances frequently compels submission to unfair exactions and hardships, and very acute corners are made in things of value, when the demand is in excess of supplies, or supply preponderates and overflows the market.

All this will be readily accepted as true, as far as goods and merchandise and all material things are concerned, but it is also equally applicable to mechanical, physical, intellectual and mental values; for these, too, in the innumerable pursuits of life, each in its order possesses value and commands equivalents according to circumstances and prevailing demands, which, if sufficiently active, will consume everything offered, with firmness as to

equivalents, the less desirable finding sale or engagement beyond actual merit value in times of posterity.

Applying this theory to mankind in their endless diversities of pursuits, the rule holds good, labor of body and mind having respective valuations—the better always commanding the higher equivalent, and in cases, the power to dictate terms. Fine abilities seldom "go begging," especially in professional spheres, and comparatively so in mechanical pursuits. Mechanics, artisans, and even laborers, who by their superior skill and competency and earnest service have reached the position of really first class in their respective lines, deserve the higher equivalent, and receive it above others whose life wants and necessities may be greater; yet, lacking the qualities which exalt their fellows above them, they are forced to submit to, and accept the equivalent for their labor, enforced by circumstances. Hence the importance of every man who is compelled to labor, striving to improve himself, to qualify himself to advance to the highest possibility, and rest not until he joins hand and gains position with those who are deservedly recognized as superior men.

As long as men content themselves with the allotments of life as received from the conditions of birth and early training, and settle down to a "can't-help-it" state of mind, they cheat and impose upon themselves heavy burdens, and debase not only themselves, but nature—through parental channels often passes down to posterity the physical and mental defects and weaknesses of father or mother, or both. This fact alone should inspire ambitions and create desires for improvement. The incentives are numerous and spread themselves along the pathway of every man, to seek and strive in an honest, right, consistent, legitimate manner to improve himself. Millions of men have lived and passed away, who were truly genuine, human gems of great value, yet from causes have not revealed the luster of their worth, because content to remain in, or unable to remove themselves from the embedments of early training.

Advancement, improvement—a climbing up among our fellowmen—are necessary adjuncts to human happiness and comfort, and is the grand balance weight that regulates equivalents and values; for the services of men are rated and paid, as a rule, according to clearly manifest merit, with those negligent of opportunities, and indifferent as to possibilities, ever at a disadvantage, and the first to be set aside when services are to be dispensed with.

Difference in Value of Labor.

THE experience of the present and all past times fully confirms the fact that there is a very material difference in the value of individual labor, some doing more and doing it better than others within a given number of hours. This fact creates a disparity in the real value of services rendered, and should regulate compensation. This it does, to the disadvantage of some, in two ways. First, in that men of greater and better mechanical skill and industry secure constant or more constant employment than others who content themselves with operating at lower levels, and working as chance opportunities present themselves, with no laudable aim or ambition for the paths that lead to honor or renown. Second, in that the better classes are always preferred, and are paid better wages. To some extent, and in some cases, this disparity and difference is not to be wondered at, because nature has withheld from some the gifts so generously and bountifully bestowed upon others. Some men might waste a whole life-time in pursuit of certain objects or results, and never attain them, for the reason that unless the physical, mental, and intellectual capacities, powers, and forces are capable and sufficient, all attempts must prove futile. No man can reach beyond the length of his arm. But unless utter submission to circumstances and an unmanly debasement pervade the mind, and the possible refinements of nature are entirely demoralized, there is a chance for improvement. And many who make no right nor earnest effort to improve themselves in directions that would better their condition might do so successfully if they would, by exercising the spirit of mastery over the inclinations that hold them back. Those who do not, because they *will not try* to do, deserve all the privations and punishments that come upon them. Neither friends nor Dame Fortune will force bread into the mouths of able-bodied men who refuse to help themselves, and reject advantages which they might utilize to their benefit. It may be hard work for some to climb and work their way upward, but better this than to remain all of life's time in the murky slums of non-improvement; for, if not advancing and lifting and gaining ground upward, such is our humanity that it cannot hold its grip at any point and remain stationary; and, if not upward, then downward it must be, and although for a time the effect of retrogression may not be rapid, it is sure, and gains pace as time rolls on, requiring but a few years to work out distressing results and debasements.

Technical Schools.

IT is doubtful if with equal expenditure of means, the same amount of effective work can be done for the future manufacturing interests of the country in any other way as can be by the establishing of schools, for which the one established in New York City, by Peter Cooper, may be taken for a model. Not that they should necessarily be of the same magnitude as this; but their aims should be in the same direction. Schools of this kind ought to be so common that every young mechanic could avail himself of their assistance in securing an education, so far as book knowledge goes, in matters relating to the trade he is learning or following. To be sure, all would not do so; but providing means would develop a large amount of latent talent that is now wasted, and the number of those who would be led, from example, to use convenient educational facilities, would increase surprisingly, the result being that manufacturers would reap the benefits of having in their employ a class of workmen bringing to their work intelligence, and a training that fitted them to think of what they were doing. And the more of the thinking, reasoning habit that is centered in any manufacturing business, the better the prospects of success.

Considering the fact, now well understood, that in the future manufacturing will partake more and more, from year to year, of the character of close competition as between different countries, the wisdom of providing every means of increasing knowledge of the subjects connected with it ought to be apparent. In European countries this is very clearly understood, and the matter discussed and helped along in every possible way. Here but little attention is paid to it outside of three or four large cities, and thousands of young men, who are anxious to devote their leisure to study, in the line of their work, find no help in doing so.

Those who have given the subject much attention have almost universally concluded that what is needed is co-ordinate education of the hand and brain. The late Professor Thompson, in his review of the reports of the British commissioners of technical instruction, a review recently made public, shows that in Europe the demand is so largely for men whose training has been, to a great extent, practical, to fill important positions, that there is an excess of men who have a training purely theoretical. He instances Germany, in which it is found that there were a large number of highly trained polytechnic graduates, for whose services there was no demand, while the Austrian Minister of Instruction lamented the inability to reduce the number of theoretical engineers, and to replace them with those who had knowledge of both theory and practice.

If such schools as the Cooper Institute were as common as they should be, this uniting of theory and practice would be the result. We have, in this country, some excellent technical schools, and some of them appear to be fairly successful in uniting theoretical and practical instruction. But no more than the merest fraction of those who ought to have theoretical training are able to take advantage of their facilities. What is wanted is an opportunity for all, so that the best that is in every young mechanic may have an opportunity to develop itself. This is what technical education is coming to in Europe, and is what it must come to here. When this is so, the most important mechanical matters in manufacturing will be in the hands of those best able to manage them in all respects, because every one who has sufficient energy to fill a position of trust, will have secured the necessary theoretical education.—*American Machinist.*

THE *American Architect and Building News* says: "Another old friend, the CALIFORNIA ARCHITECT, is also greatly improved by its new form and style; but we think it's moan that the Pacific Coast—its own preserve—has been deluged by 'tons of specimen copies' of Eastern architectural publications, is unworthy of the courage that has brought the journal to its present position, and perceived the benefits that might accrue from the improvements just referred to." We certainly fail to discover the basis upon which our contemporary reared that doleful word—moan. We merely stated the facts of the case and their extraordinariness, and concluded with the quotation, "He that wrestles with us strengthens our nerve, and sharpens our skill; our opponent is our helper," adding, "so we consider it, and not only propose to hold our own in the face of this avalanche of interlopers, but to so far excel them in supplying a journal specially adapted to this coast, that their presence will be *eminently immaterial*." If this language is susceptible of the construction placed upon it by our contemporary, we must admit that we failed to give proper expression to our views of matters; for while the "sample market was flooded" it gave us but little concern, feeling, as we did, well assured in the strong position gained by this journal among the thousands who so eagerly read its contents each month.

You Will Live Just as Long.

"GO SLOW;" "take it easy, and you will live just as long," is proper advice to over-diligent men, who do *more* than a fair and reasonable amount of hard work, within the usual prescribed limits of business application, often extending earnest labor into the hours of evening, which should be sacred to restful pleasures or social joys, and to all who are over-anxious, wearing away the vitalities of early manhood, to battle against sometimes imaginary odds, to gain business successes. But its force and application in business relationship cease with these. Men by nature made so, or by education taught to be, slow in every movement, never diligent in anything, never anxious beyond personal comfort and convenience, never intensely earnest in any pursuit, need no such advice.

To wage earners the advice is pernicious, if not in application, dishonest towards employers. The man who employs engages to pay for, and he who hires himself for wages or salary agrees to give, and sells his time and abilities for the price agreed upon, and for the hours per day usual in such cases, or as defined by stipulation, at a certain sum per diem, month or year; consequently *every moment of time* within such hours, and every *right* and *reasonable* service possible in the employed, becomes the property or value of the employer, for which he has paid or is to pay, and any misuse of either is an abuse of the employer's rights. Hence there is no such thing as a wage-earner "going it slow"—*honestly;* of "taking it easy" in the common-sense of the terms, which in effect are simply another manner of expressing the discreditable terms, "loafer" and "loafing," an idling away and waste of time and services *belonging to the employer*, and which an employe has no more right to indulge in than in misusing articles of trade. Every yard, package, or pound of goods in store or trade, belongs to employer, and costs him money, and any party found appropriating any portion of them without accounting, would be considered a *thief;* yet such goods and merchandise no more belong to and cost the owner money, than does the services of employed assistants, clerks, or day laborers; and, viewed in the light of fair—not to say strict—integrity, every hour not put in to the best advantage to the employer, by the employed, is *practical dishonesty*, and, generally, it is of mean and sneaking character, when the willful idler and cheat, conscious of wrong on his part, watches the approach of the employer, and springs to actual or pretended duty at his approach.

Most of those *seemingly* nice maxims and old saws are bad in practice for young men. "Go it while you're young, for when you get old you can't," has proved the ruin of hundreds of thousands of men and women, who, when too late to counteract, have experienced the folly of their mistakes; and millions of men now walk earth's surface in poverty, or lie in prison cells, or places of public charity, through following out the theory of the maxim quoted; better to reverse the rule, *go slowly, cautiously, savingly*, in the days of youthful vigor, so that the years of age and gray hairs may be full of strength and comfort.

A Substitute for Plaster.

THE ornamental finish of the walls and ceilings of rooms and interiors has attracted the attention of our best artists, and a succession of experiments has produced many different materials to be applied in various ways. In opera houses, theaters, public buildings, and private houses of the best class, the use of plaster has been almost entirely done away with. It was objectionable on account of its weight and liability to crack or become damaged.

Every one knows how quickly a little water will disintegrate plaster material and cause it to loosen its hold, and how frequent are accidents of that kind.

The difficulty and trouble necessary in making repairs were further reasons why a substitute should, if possible, be found. Neither a delicate design, nor objects in high relief can be reproduced in plaster. A new and improved material known as fibrous-stone composition has lately been quite extensively used in the Fifth Avenue Hotel, Wallack's Theater, and the private residences of many wealthy gentlemen, upon ceilings and walls, as well as in the ornamental finish of panels, pilasters, and cornices. It has a fibrous foundation, is extremely hard, and can be cut, sawed, filed, and nailed like wood. There is never any danger of its being displaced by sudden jars, or crumbling and tumbling down.

In case of fire it is incombustible—not lending its aid like lath to the conflagration—merely charring into a black stony substance. It is as hard as iron and has really the strength of metal without its weight.

The most esteemed value of this material for decorative purposes is the high artistic character of the work. A model in plaster is first made, the excellence of which depends on the talent of the artist. From this original model a faithful and exact fac simile is reproduced, which is sharp, clean, and with the lightness and grace of superior hand-work. It has a close texture, smooth surface, and can be at once put up without the aid of lath and plaster, and is all ready to receive paint, or metallic finish.

Neither heat nor cold will warp or shrink it and no change of atmosphere will affect it, therefore it is applicable for exterior as well as interior finish.

The combination of lightness and strength is a feature of value; great fluted pillars and deep theater cornices are furnished in sectional parts and handled with ease.

Those charmingly developed figures of heroic size, which we have noticed as posing in graceful attitudes above the stage curtain, and those other obliging females who kindly officiate as perpetual candelabra are hardly more weighty than an orphan child. In construction and manipulation, such practical advantages are easily understood. On the other hand, the delicate tracery of a hand-carved picture frame is reproduced with faithful accuracy, and the dainty, high-bred wall ornamentation of the Louis XVI. period is made with absolute exactness of detail and finish.

Comparative Compressive Strength of Granite.

COMPARATIVE tests of the granites of New England and Minnesota, instituted by Professor Winchell, with a view to determining their crushing strength, exhibit some surprising differences. The pieces employed for this purpose were 2-inch cubes unpolished, and crushed between wooden cushions the average strength of 20 specimens of Minnesota granite was found to be 93,272 pounds, or 23,318 pounds per square inch; crushed between steel plates the average strength was 104,800 pounds, or 26,200 pounds to the square inch of surface. The average obtained for the same number of specimens of New England granite was 59,789 pounds, or 14,756 pounds per square inch. The age of Minnesota granites is archæn; that of New England granites is not definitely known.

ONE of the oldest landmarks in New York has been recently destroyed. The building in question was located at 75 and 77 Nassau Street, and dated back to the period when New York was an English colony. It was a two-story brick dwelling when the Old North Dutch Church—afterward the New York Post-office—was built, and perhaps antedates the old Washington Headquarters at the foot of Broadway, on whose site the present Washington Building stands. Three stories were added in 1785, and since then it has passed through all the changes of a century practically unaltered. For some years it has been considered unsafe on account of the shallow foundations, and the owner reluctantly gave orders to have it torn down. As a specimen of the thoroughness and solidity of house-building 100 years ago the half-dismantled walls were extremely interesting. The front stood like a face of rock, the thin bricks and cement-like plaster having become welded into a single mass which the workmen broke with strong cold-chisels and even sledge hammers. The bricks used were all imported from Holland, and are about $6\frac{1}{2}$ inches long and $1\frac{1}{4}$ inches thick. The mortar was made of pure shell lime with almost no clay or sand in it, and forms a third of the solid mass. "I have torn down a great many old houses in New York and Albany," said Edward Sorensen, the contractor, "but I never saw one so well built as this. Why, it's like rock or flint. It will take my men ten times longer to tear down the walls than it would to build new ones. There's no 'Buddensiek' about these old Dutch builders. You can't find anything like that front wall now."—*Carpentry and Building.*

CHANGE IN STYLE OF ARCHITECTURE.—At the Royal Academy exhibition in London, which gives a fair idea of the architectural taste of the time, it will be found that the plain early English style, so popular with architects for many years past in the designs for churches, is giving way to later styles, especially the flamboyant decorated. A curious example of this new departure is shown in the subjects chosen for study by the art students in the Architectural Museum, Westminster. A few years since scarcely any subjects were selected for drawing or modeling but the beautiful foliages of the thirteenth century, whereas now perpendicular details are preferred almost to the exclusion of all others.

Stagnation in English Shipbuilding.

THE mechanics and laborers employed in the various branches of shipbuilding in England are much concerned over the depression which began in 1884 and yet continues. The total amount of shipbuilding on the Clyde last year, as officially reported, was 195,458 tons, against 296,854 tons in 1884, and 419,664 tons in 1883. At other British shipyards the facts are as disappointing as on the Clyde. This depression has not been affected by any struggle between capital and labor, for there have been no such contentions in the past year. The exceptionally heavy output in 1881, and the two following years, has placed upon the seas an amount of tonnage such as was never previously witnessed, and unless England soon finds new worlds to conquer it is not likely she will want any more new ships for a while.—*The Tradesman.*

UNLESS a radical change supervenes upon the present aspect of affairs, it is certain that some dregs yet remain to be drained before the *vetro flux* of depressed trade has entirely exhausted itself. If we read the signs of the times aright, there are still the last drops to be emptied before the "turn for the better" can really be said to be accomplished. Trade fluctuates in a manner known only to itself, and, although some profess to have discovered a uniformity in the cycles of bad and prosperous times, the divergences in their estimates only serve to emphasize the impossibility of successfully defining such intervals. There is, however, a magic about the mystical "seven" which, through many analogies, has become intimately associated with any change *a fundamento*, and, although the suggestion does little more than fix a coincidence, it may be well to point out that it is now nearly seven years ago that the storm of the last crisis passed over our heads, and left the commercial atmosphere free for the enjoyment of that good long spell of fair weather that followed. We can only hope that the present will prove itself a parallel, although it must be confessed that, at the moment, the clouds show the least perceptible signs of breaking.—*Timber, London.*

THE day of the esthete is approaching a close. Oscar Wilde has cut his hair and consented to appear in "store clothes;" there is melancholy loneliness about the few disciples that still cling to the memory of his curly locks and Bloomer costume that excites sympathy. Oscar was the originator, and knew when the time came to give it up—that time followed closely upon the heels of his $30,000 trip to the United States—his followers, being but imitators, don't know whether it is time to abandon the idea and hardly know how to do so, even though the time has come. The vapid conversation born with esthetic ism, the exaggerated fob charms, the solitary eye-glass, the flimsy carriage and the deliberate indifference, all prevail to a considerable extent, all have taken a hold that common sense will gradually, though not rapidly, loosen.

In the furnishing and decoration of the home, estheticism shows greater decline than in any other direction; one may be willing to pervert his or her personal dress or characteristics or actions to accord with some crazy idea he or she may entertain, because that costs nothing further than a sacrifice of sense or comfort, and this is readily made; but, when the more serious duty of furnishing comes to be considered, and one is confronted with the esthete's dictum that spareness is a guarantee of good taste, then repudiation usually follows, and the bare floor and bare wall and scant furniture are made to fit the true taste of the individual rather than the acquired.

It is interesting to watch the gradual dissolution of the esthete.—*Decorator and Furnisher.*

ACCORDING to the statements of our versatile Southern correspondent, large areas of lumber lands in the South are being purchased by capitalists, who see that the rapid consumption of lumber, in the United States, must soon make very valuable all wooded lands that are within the reach of railroads or rivers. Every dollar now invested in these untouched timber resources will multiply itself over and over again, within twenty years. This country is of vast extent and the consumption of lumber must increase constantly. The building and maintaining of railroads and the ever-increasing demands of house building, in sections destitute of stone, must swell the consumption so that, in time, prices may be pushed so high as to bring into market supplies of lumber not counted at all now because of their remoteness from consuming centers. When these investments realize, it will be on a large scale, and some great fortunes will be rolled up as easily in lumber lands as they have been rolled up in lands upon which cities have sprung into existence. It is not altogether desirable, from an economic and philanthropic standpoint, that men should thus become the owners of great tracts of land, but the competition is open and there is no law against investments such as are referred to.—*Lumber World.*

THE February number of the *Phrenological Journal and Science of Health* (Fowler & Wells Co., 753 Broadway, New York) contains very interesting articles on "Medical Missionaries," "Improve the Morals," "Knowledge," "A New Phrenology," "Professor Drayton's Familiar Talk to Our Young People," "The Stupidity of Sensible People," "Wm. H. Vanderbilt, the Richest Man in America," "Notes from a Teacher's Diary," "An Historical Article from Veronique," "The Vandals, the Goths, and the Huns," "A Magic Lamp," "Should Silver be Demonetized," "The Pictured Rocks of Iowa," "A Tired-out People," "New Theories of Muscle Action and Nutrition," illustrated, "The Physiological Basis of Faith Cure," "Pinel and Insanity," and numerous short articles instructive and interesting. The above journal is usually replete with matter which should be read in every family. Price, $2.00 per annum.

ARCHITECTS are somewhat given to quoting various authors, from Vitruvias to Owen Jones, who insist that painting and sculpture, as well as the minor arts, should be used only as the handmaids of architecture. But this is true mainly as regards monumental structures devoted to the highest uses of ecclesiastical and civic life, or to the commemoration of the dead. It does not properly apply to the private house, and, indeed, under any circumstances, it is manifest absurdity that the statue into every line and curve of which the sculptor has wrought the riches of his brain and heart, or that the portrait of the master painter should be killed by the black, vermilion, ultramarine blue, or emerald green of the frescoer, or the stenciled, stereotyped convolutions of the paper-hanger. If one listens to a solo from a Lind or a Mario, it is an impertinence to have it drowned by the frame-work music of the orchestra, though we may derive much pleasure and musical profit from the orchestra's harmonies without the solo.

The more pronounced in form and color the movable objects of an apartment may be, the more pronounced may be their background; and where they are designed and arranged with special regard to luxury and splendor, the background may be worked up to high effects of general tone, and in some instances even its details may be tolerably assertive without losing that character of subordination which is, or should be, a desideratum.

THE

MECHANICS' INSTITUTE

OF THE

CITY OF SAN FRANCISCO, CALIFORNIA

ORGANIZED JANUARY 3, 1855.

LIBRARY BUILDING:

31 Post Street, Between Montgomery and Kearny.

MEMBERSHIP.

Entrance Fee,	$ 1 00
Due per Quarter,	1 50
Life Membership,	50 00

The Library Rooms are large, well lighted, easy of access, and include a private conversation and reading parlor for ladies.

The Library contains forty thousand volumes. The Circulating Department has twenty-one thousand well-selected volumes. New standard and popular works are added as they appear.

The Reference Department is unusually comprehensive; contains many valuable works not possessed by other libraries on this Coast, and is recognized as the best educational library in the State. Members are requested to suggest the names of books they desire, that are not in the Library.

All the privileges of a private library are enjoyed, the Rules permitting personal access to the shelves.

The Reading Rooms are well supplied with Papers, Magazines, and Reviews from all parts of the world, especial attention being given to scientific and educational publications.

The Chess Room is the largest and finest in the country, and the best players on the coast have become members of the Institute.

The Institute has been made the official Repository for Patent Reports by both the English and American Governments, thus making membership of benefit to manufacturers and indispensable to inventors.

The Library is open from 9 A. M. to 10 P. M. On Sunday, for reading only, from 12:30 to 4:30 P. M.

The Reading and Chess Rooms are open every day in the year from 7 A. M. to 10 P. M., except Sunday, when they are open from 8 A. M. to 9 P. M.

Rooms open for inspection day and evening.

MECHANICS' LIEN LAW.

THE ONLY COMPLETE COPY OF THE LAW PUBLISHED.
WITH SUPREME COURT DECISIONS, NOTES, AND EXPLANATIONS.

Every Architect, Mechanic, and Owner should have a copy. Published by the CALIFORNIA ARCHITECT AND BUILDING NEWS CO. Price, 50 cts., bound in cloth. Sent by mail, free of postage, on receipt of 50 cents in one and two-cent stamps or postal order. For sale at the office of this jornal. Trade supplied.

CONSTRUCTION OF TRUSSED ROOFS.

A Practical Book on the Subject,
PUBLISHED BY W. T. COMSTOCK—PRICE, $2.00.

It will be sent by mail free of postage to any part of the world. On sale at this office at publisher's price.

Building Intelligence.

A

Austin, nr. Polk. One-story brick.
O.—M. Sweeney.
C.—H. Please.
$1,200.

B

Baker, bet. Sutter and Bush. One-story frame.
O.—D. Reese.
C.—F. A. Steinman.
$2,000.

Baker, cor. Grove. Two and one-half story frame.
O.—Boys and Girls' Aid Society.
A.—Clinton Day.
C.—Ingerson & Gore.
$30,000.

Broderick, nr. Hayes. One-story frame.
O.—Mrs. J. Fahey.
A.—Salfield & John.
C.—D. B. Spangler.

Bartlett, nr. Twenty-fourth. Three one-story frames.
O.—Julia Whitney.
A.—M. J. Welch.
C.—M. Walsh.
$5,250.

C

California, bet. Jones and Leavenworth. Two-story frame.
O.—Mrs. M. Hogan.
A.—C. I. Havens.
C.—C. Quinn.
$4,440.

Church, cor. Twenty-first. Two-story and basement frame.
O.—Jas. O. Clark.
A.—B. E. Henriksen.
C.—A. Norton.
$5,800.

Clementina, bet. Third and Fourth. Three-story frame store and two flats.
O.—P. Dumeneim & J. Lassalle.
A.—M. J. Welch.

STATUE OF "LIBERTY ENLIGHTENING THE WORLD."

More Money Needed.

The Committee in charge of the construction of the pedestal and the erection of the Statue, **in order to raise funds for its completion,** have prepared, from model furnished by the artist, a *perfect fac-simile* Miniature Statuette, which they are delivering to subscribers throughout the United States at the following prices:

No. 1 Statuette, *six inches in height*,—the Statue bronzed: Pedestal, nickel-silvered,—at **One Dollar each,** delivered.

No. 2 Statuette, in same metal, *twelve inches high*, beautifully bronzed and nickeled, at **Five Dollars each,** delivered.

No. 3 Statuette, *twelve inches high*, finely chased, Statue bronzed, Pedestal, **Heavily Silver-Plated,** WITH PLUSH STAND, at **Ten Dollars each,** delivered.

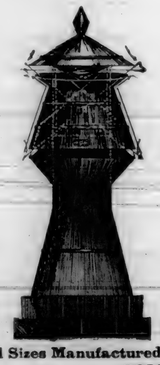
Much time and money have been spent in perfecting the Statuettes, and they are much improved over the first sent out. The Committee have received from subscribers many letters of commendation.

The *New York World* Fund of $100,000 completes the Pedestal, but it is estimated that $40,000 is yet needed to pay for the iron fastenings and the erection of the Statue.

Liberal subscriptions for the Miniature Statuettes will produce the desired amount.

Address, with remittance,

RICHARD BUTLER, Secretary,
American Committee of the Statue of Liberty,
33 Mercer Street, New York.



"NONE SUCH"
CHIMNEY TOP VENTILATOR

THIS VENTILATOR is especially valuable for regulating draft (upwards and downwards) made by the light, unstable atmosphere of the Coast Range of Mountains. The hundreds of tall stovepipes erected on the chimney tops of houses indicate inconvenience and trouble in the kitchen, the parlor, and chambers below.

SAN FRANCISCO, October 26, 1885.

To whom it may concern:

I take pleasure in stating that the "None Such" Chimney Top and Ventilator, which was put upon the smoke-stack of the Baldwin Hotel about two months ago, has given complete satisfaction.

It has increased the draft to such an extent that there is a perceptible saving in the amount of coal consumed; smaller fires than heretofore will now answer to keep up the steam, thus causing a great saving of the boiler also. We have heretofore had much difficulty in keeping up the amount of steam steadily required, owing to the lack of draft, all of which is now remedied by the use of the "None Such" Chimney Top and Ventilator. I heartily recommend its use to all persons, where a strong draft is required.

PEARSON & ARNOLD,
Proprietors the Baldwin.

"High Building"—Law of New York.

BUILDING, in its issue of March 20, refers to the introduction of a bill in the New York Legislature to repeal the "high building" law, passed by the law-making body and signed by the Governor last summer, which restricted the height of tenement buildings to seventy feet on streets of sixty feet or less in width.

The passage of the restrictive law was received with favor and approval, except by speculative parties who would not only—if possible—penetrate the lofty clouds with piles of brick and mortar, but dig as deep in the opposite direction, for sordid gain, without a single regard for human life, health, or comfort.

There is but a single reasonable and right argument favoring excessive heights of tenement structures, to wit: positive insufficiency of space of territory to supply the required number of shelters for the inhabitants, and even in this and every other regard they are objectionable, as they shut out some light, and cast gloomy shadows, and provide darkened and gloomy apartments, which possess none of the elements of cheerful life. "They are so regarded *per se* and in their relation to adjoining property."

"In view of the fact that in every civilized country there is some law fixing the proportion between the height of a dwelling and the width of the street on which it adjoins, the city of New York acted wisely in having such law passed last year. It would be a serious step backward to repeal now this beneficent law. It should, by all means, be supported."

Change of Date of Issue.

WITH the January issue of this journal, the date was fixed at the 5th of each month. This, however, does not work well, and we are compelled to change date of publication to the 10th. The reason for this is, that reports of meetings held in the first week of the month often come to hand too late for insertion until the following month. Consequently, for the purpose of accommodating all interests, *the tenth day of each month will hereafter be the date of issue.*

All communications should be handed in as near the first as possible, and reports not later than the sixth of each month.

Summary of Building Activities.

OUR present monthly report shows an apparent decrease in building operations, over the same month's report for 1885; but scarcely so in real fact, as several commencements are not included this month, for the reason that only portions of the work has as yet passed to contract. With these added, the amount for April, 1886, would fully equal that of 1885.

The grading, brick work, cast iron work, wrought iron work, and carpenter work of the J. C. Flood's building, corner Market and Fourth Streets, have been let respectively, in the order named, to A. C. Buckman, Butler & McGowan, Reese Llewellyn, Sims & Morris, and C. C. Terrell. The total of these and the remaining branches will appear in future issues.

Additional contracts on the Nightingale building, to the amount of $31,035, have been let, but these do not include entire cost.

"Davis Bros.'" building is in progress, and will be an expensive building; but, as yet, the contracts awarded amount only to $19,500.

The activities in residence and tenement improvements are large, and the prospective outlook is of the most encouraging character. The report for April sums as follows:—

152	frames, value	$675,206
6	bricks "	51,000
24	alterations and improvements	112,310
182	Total for current month	$838,516

For same period in 1885: Total engagements, 168; total value, $1,131,450, showing for April of present year, 14 commencements more than in 1885, with $292,934 investment in favor of the preceding year. But, as we have stated, were the cost of the buildings commenced, and not included in present report, added, the balance would be in favor of 1886.

Delaying reports of contract amounts for portions of the work on buildings, until all the branches are let, is preferred by most architects and owners, and is more a matter of interest than importance to outsiders. We do so in many cases by special request, not failing, however, to wind up our annual report with the full sum of expenditures, as nearly and correctly as possible.

HYDRAULIC-LIME CONCRETE.—A kind of concrete, hard and solid, is now being used for building purposes in Paris. It is composed of eight parts of sand, gravel and pebbles; one part of common earth, burnt and powdered; one part powdered cinders, and one and a half parts unslacked hydraulic lime. These materials are thoroughly beaten up together, their mixture giving a concrete which sets almost immediately, and becomes in a few days extremely hard and solid, which property may be still further increased by the addition of a small quantity, say one part, of cement. Among other constructions to which this material has been applied, is a house three stories in height, sixty-five by forty-five feet, standing on a terrace, having a perpendicular retaining wall 200 feet in length and 20 feet high. Every part of this structure was made of the hard concrete, including foundations, vaults of cellars, retaining walls and all walls, exterior and interior, as well as the cornice work, mouldings, string-courses, balustrades, parapets; and the building is without band-iron, lintels or wood throughout.—*Exchange.*

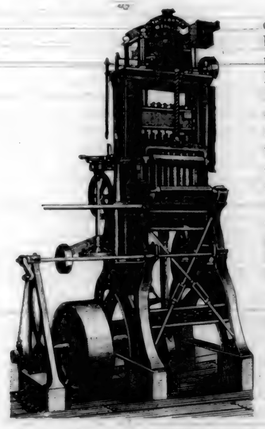
THE EXPLORATIONS AT DELOS.—In the *Revue Critique*, M. Homolle gives an account of the results of the new explorations carried on at Delos. The remains of a medieval city have been laid bare, and the discoveries in the field of classical archæology, though not so sensational as those of the previous enterprise, are still full of interest for the history of the "island schools." Fifty fragments of marble sculpture have been found, besides *terra cotta* and small bronzes. To these have to be added 224 fragments of inscriptions, some dating as early as the fifth century B. C.—none later than the first century B. C. They contain funeral inscriptions, dedications, decrees, and choragic lists. One of them is 600 lines long, and the whole, when edited, are sure to throw much light on the politics and commerce of the Cyclades.

Something New in the Manufacture of Lumber.

EVERY perfected improvement in machinery, systems, or methods calculated more fully to develop and enlarge the manufacturing and producing interests and resources of the Pacific Coast, becomes a matter of general, as well as specific and individual interest. The permanent prosperity of this State depends largely upon the practical developments in the mechanical and producing arts and sciences, with the growth, expansion, and enlargement of which, sufficient to meet and supply the daily, re-occurring necessities and demands of the times, assurance and confidence is strengthened, that California and its sister Pacific States and Territories are, in themselvese, qual to any emergency that may arise, with surplus for other markets. A people possessing the intelligence, practical capacities, energies and availabilities to produce and supply every home and local want from natural resources within their own boundaries, must ever be self-reliant, progressive, and aggressive in everything that promises personal and community comfort, happiness, and wealth.

A SPLENDID SAW-MILL OUTFIT—NEW DEVICE.

In this connection we present a cut and short description of a new saw-mill enterprise which should, from the standpoint outlined above, be a matter of interest far beyond the circle of those directly connected financially, for two special reasons: 1. Because in and of itself, the mill, with its numerous appurtenances and appliances, is a most complete and perfect mechanical conception, unequaled by anything of its kind in use upon this coast in the manufacture of lumber. 2. The mechanical construction of the mill is entirely Californian, or, more properly speaking, San Franciscan—the first of its kind ever manufactured on this coast, and another illustration of the capacity, proficiency and skill that has placed the Union Iron Works of this city in the fore ranks, if not fully equal to the oldest and best in the United States in the production of massive as well as intrinsically fine machinery.



This piece, or combination of machinery is claimed to be the largest of its kind in use in the manufacture of lumber—at least west of the Rocky Mountains. It is what is known as a "gang," but differing materially from the old, ordinary gang-saw device. It is a steel sash, or frame, 44 inches in width, with 32 saws in the frame, driven vertically by steam power. The arrangement is such that the frames and saws oscillate, so as to produce a motion similar to the old-fashioned whip saw. The vertical motion of the saws is 200 per minute, which, multiplied by the distance traveled each motion, 2 feet = 400 feet to each blade + 32 blades = 12,800 feet of cut each minute by the gang, producing each day of 10 hours, 50,000 feet of lumber, with the twofold advantage of economy in the log material, resultant from the saving produced by the use of thin-bladed saws, and the sawing of lumber absolutely true, straight, and square. The mill was designed by Mr. F. S. Farmer, who is acknowledged to have no superiors in practical saw-mill engineering on this coast, and who has built some of the finest mills known to the trade.

Mr. Irwin M. Scott, manager of the Union Iron Works, was so favorably impressed and well pleased with the drawings prepared by Mr. Farmer, that he applied, and, as will be seen by examination of the cut, placed on the head frontis-plate the name, Farmer Gang.

Some idea of the magnitude of the mill may be comprehended by the fact that the construction shown by the cut weighs 62,000 pounds, 31 tons, sand cost about $10,000. It is now being placed in position by its designer, at the extensive mill site of the Western Mill and Lumber Co., Port Hadlock, Puget Sound, Washington Territory. The office of the Company is at 840 Fourth Street, San Francisco, Turner, Kennedy & Shaw, agents. It may be further stated that the other appointments of the mill consist in part, of ten heavy steel boilers, two large engines, 28x36-inch cylinders, gang edgers, live rolls, yankee fireman, slab and sawdust conveyors, bull wheels, and all other appurtenances required in a first-class lumber saw-mill.

"Reciprocal relief,"—"home manufacture,"—is well exemplified in this connection, as the whole of this splendid machinery and outfit are the product of a San Francisco machine shop and foundry, which must be admitted as a creditable witness to the fact that there is no right or reasonable excuse on the part of any one going abroad to obtain that which can be as well or better produced among ourselves, as from quarters and parties in other sections of the country, whose only special sympathy in the interests of this city, State, and coast, is to secure contract and trade advantages, and bear away not only the *profits* on engagements, but the *full sum of cost of raw material and labor as well.* In this regard, the promoters and owners of the enterprise under notice deserve all praise; for while a financial preference was given to the San Francisco firm, they did not err in doing so, as they have in return, machinery that could not be bettered anywhere in completeness and quality of workmanship, and the money so expended remains in this city, as bread cast upon the waters, to return in part at least, in due time. And the proud satisfaction of having a mill unsurpassed, if approached, by any other within the entire scope of the great northwestern timber regions of our great continent, is one that should fully compensate for every sacrifice made in preferring and rewarding home industry, over the questionable and petty economies that might have been practiced in canvassing for a cheaper market to secure a present saving, at the expense of tenfold cost in the future to remedy the imperfections assured and certain to follow, particularly in machinery works, when cheapness is made the controlling factor. The support of "home industries" is the life of every city and State, and those who go abroad for that which can be procured at home, as good in kind and quality, certainly forfeit claim to good citizenship, as far as the best interests of the commonwealth are concerned; for money required to pay for the thing unnecessarily imported, must come from the purses of those who should have enjoyed the benefits and advantages of producing, or manufacturing the thing imported.

It is to be hoped that the example set in this case may prove powerful in argument against the unwise practice, on the part of many, of sending abroad for that which can be had this side of the mountains, without any loss or sacrifice whatever, other than that of subjugating a penurious disposition of mind to the wiser economy of sustaining home industries.

The Acoustics of Churches.

THIS subject is of the greatest importance in connection with a large church suited to modern requirements, but, unhappily, very little is really known concerning it. This, however, is certain, that echo and reverberation are caused by sound being reflected from flat surfaces within confined spaces. In churches these effects mostly result from bald, unbroken wall spaces, bad proportions, piers with flat surfaces, horizontal ceilings, and square-ended transepts, unless the transepts be of such length that the voice, decaying before reaching the end walls, is not strong enough to be unpleasantly reflected. It has been unjustly said that domes are always bad for sound, and St. Paul's is frequently instanced as an example. I maintain that a dome is not necessarily bad for sound, and many Gothic churches have more reverberation and echo than many Italian churches with cupolas. The acoustic qualities depend upon the arrangement. In St. Paul's the dome has certainly very little to do with the acoustic defects, and I quote St. Paul's as a well known example. The reverberation there is caused mainly by the flat surfaces of the piers generally, by the re-entering angles of the large piers at the corner of the octagon respectively, by the slight curve and plain circular face of the pendentives, by the square-ended transepts, and by the large flat surfaces in the aisles. At a certain distance from the re-entering angles of the large piers, at the point where the voice of a preacher is reflected from both surfaces and these reflections meet, not a word can be distinguished; while by moving out of the angle of reflection only one or two seats farther forward, and being then seventy or eighty feet from the speaker, every word can be distinctly heard. This demonstrates the effect of large piers with flat surfaces. St. Augustine's, Hackney, is an instance out of many of the effect of bald wall surface and square-ended transepts. There, when the pulpit was placed near the chancel arch, the reverberation was very great, the voice being reflected by the transepts, which have no arcades or aisles; when, however, the pulpit was moved to the west side of transept into the nave, the preacher could be heard with ease; and other instances of a similar plan give the same result. In other large churches with aisle walls quite plain to a considerable height, the reverberation is always great. Professor Roger Smith, who has given this subject much attention, has evidently arrived at a similar conclusion as to the cause of echo, etc., for he says in his work on practical acoustics, "The formation of recesses, breaking up end walls, rounding and canting off angles, bringing the ceiling onto the walls with a cove or cant, and breaking it up with groining, are all methods of avoiding the risk of acoustic failure." In plain language, this means that plain surfaces should be avoided. Domes of no great height, on square piers, or over spaces confined by flat walls and without large voids like a nave or transept, into which sound may escape, are undoubtedly bad as far as echo and reverberation are concerned. This is notably shown in the Pantheon at Rome, the reading-room at the British Museum, London, the Picton Reading-room, Liverpool, Napoleon's Tomb, at Paris, the Taj Mahal, at Agra, and numbers of the Italian and Indian domes. In these the voice cannot escape, and is reflected backwards and forwards from the flat surfaces. That a low dome is worse in its acoustic results than a high one is proved by the fact that the reverberation in the first gallery of St. Paul's is much greater than on the floor level, while in the whispering-gallery the echo is extraordinary, as the name denotes. The Picton Reading-room is also a local example of this. In fact, to avoid reflection (*i. e.*, echo and reverberation), sound must be either lost in a void, or absorbed by drapery, or deflected and shattered on the confining surfaces. In the latter case there is practically no reflection from the piers or walls. It is evident, if this can be arranged, that a larger congregation could hear more freely in a great area covered by a lofty dome than in a long and comparatively narrow nave. And this result can be obtained by the shape of the piers, the arrangement of wall surfaces, and the proportions. For a voice to fill a large space accommodating a crowd of two or three thousand people, a sounding-board would always be necessary to throw the voice forward. In the plan submitted* to give practical effect to the principles above stated, all lengthened plain surfaces of wall have been avoided; the dome is of great height, and the nave and transepts form large voids into which sound can escape. The large piers supporting the dome are circular on plan, by which means the direction of sound would simply be changed without reflection. The alternate sides of the octagon have semi-circular recesses behind the arches, broken by galleries, by deeply-recessed windows, and by double tracery. The pendentives are constructed with a great variety of curved surfaces at different angles, and broken by projecting arches and ribs. Above the pendentives two galleries break the height, also a traceried arcade in front of the deeply-splayed windows. The dome itself is of such a height that any reflection of sound taking place, in spite of the arcading to the drum and the projecting galleries, would practically be lost, and could not affect either the preacher or the audience. The transepts are as deep as the site will allow, are octagonal on plan, instead of flat, and have recesses at the angles. The aisles are broken by deep recesses formed by bringing the necessary buttresses inside (giving also greater internal effect of width, and supplying space for monuments, and having a constructional advantage with the form of roof adopted by giving better abutment at the foot of the roofing vault to aisles). The surface of the west wall is broken by projecting columns and a gallery (which also affords convenient space for arranging either heavy curtains, mats, or a screen to the west doors). The roofs, too, are groined.—*William Emerson, in British Architect.*

*Reference to which was made in *Building* for March 13, in the description of the designs submitted for the Liverpool Cathedral.

Conglomerate—"Fire Limit Ordinance," Building Law, Etc., in San Francisco.

LAWS and ordinances establishing and empowering "Building Bureaus," "Building Boards," "Boards of Public Works," etc., exist in most of the larger cities of the United States, with special jurisdiction over t e erection and construction of buildings, in matters of sufficiency of strength and other details, as regulated by the respective codes of laws and ordinances, which are from time to time changed and amended to fit each newly-developed necessity.

But—singular as it may appear, and is in fact—in the great, prosperous, and progressive city of San Francisco, there is no better building law than the *medley* of "Fire Limit Ordinances," in which is mixed up all there is in the shape of laws and ordinances regulating the science of architecture and building construction; and to complete the irregularity, the interpretation, application, and enforcement of the ordinance is placed wholly within the control of the chief of the fire department, his deputies and assistants, and those within the fire department circle. To all of which, there are many reasonable and valid objections.

The construction of buildings, in an architectural and mechanical sense, is an important special science in and of itself, requiring mechanical and professional skill and experience to rightly understand, apply, and demonstrate its numerous problems. This being so, it should be under the control of those properly qualified by individual education and practical experiences to manage and direct matters.

On the other hand, the science of combating the devouring elements is one of special character, requiring special physical and mental qualifications,—courage, strength, agility, daring, correct judgment, etc.; but men may become splendid firemen, as chiefs and subordinates, braving terrible dangers and performing acts of heroism, who, in other spheres, would amount to but little, and who, if called upon to decide issues in, or direct constructive building operations *from, personal knowledge and understanding,* would be altogether incompetent.

In the fire department sphere, the great and all-absorbing thought runs in the fire channel, and the thinkings and dictations of wardens, chief, deputies, and men are pre-eminently for fire department interests, and every other consideration is made to bend and yield to the notions and ideas incubated and vitalized under the influence of the fire department.

The two sciences, therefore, being distinctive in character, requirements, purposes, etc., should be provided with governments, managements, and dictations specially adapted to each; all matters involved in or pertaining to the control of the department,—conflagrations, storage of dangerous explosives, and the innumerable details of the special department work,—remaining with the fire wardens, chief, and their auxiliaries; and that which pertains to building construction to be placed under the control of a "Building Board," "Building Bureau," or any other form of authority composed of intelligent and competent men, familiar with the numberless involvements in building construction.

The ordinances at present affecting building construction are certainly not by any means explicit, sufficient, or consistent, and many of the provisions are daily disregarded by both architects and builders; and, being so thoroughly impracticable, their violations are permitted to pass unnoticed, even by the watchful guardians who sometimes insist upon the rigid observance of immaterial things, which are enforced because the ordinance says so and so, although, practically, for any good purpose, the same may be entirely useless and unnecessary.

These suggestions are made in all candor, without intent to antagonize or offend in any direction. The division proposed is in harmony with the results of experience in other cities, where building laws, special to constructive works, are considered to be of vast importance, and receive great attention. There is no good reason why an efficient Building Board should not be established in San Francisco. The columns of this journal are free to any one entertaining adverse views upon the subject matter introduced in this article, as well as those in harmony therewith. An intelligent discussion of the issue might prove interesting, and lead to right and desirable conclusions and results.

Strength of the Knights of Labor.

IN speaking of the great strike now going on, and extending from St. Louis to the Gulf of Mexico, the St Louis *Globe Democrat* says: "It is ascertained from the most reliable sources that District Assembly No. 17, with headquarters in this city, has a membership of from 12,000 to 15,000, and within a radius of 300 miles are about 50,000 Knights of Labor. Altogether in the country there are, counting some newly organized assemblies, about 160 district assemblies, some of which are very strong, numerically considered. Some of the district assemblies in the manufacturing districts of the East count up fully 50,000 members, and of the total membership of the order various estimates are given, ranging from 500,000 to 1,500,000. In close connection with the Knights of Labor in this city is the International Working People's Association, which will give the Knights of Labor their moral support, and, if necessary, material aid. Both organizations are said to be in close communion, and will act in concert in any emergency that may arise. The numerical strength of the International Working People's Association has been greatly underestimated, from the fact that they do not care to let their exact number be known. In the various groups of the order are included something like 10,000 members in this State and Illinois alone. In this city and close vicinity are probably 20,000 men who are members of organizations directly upholding the strikers of District Assembly No. 101.

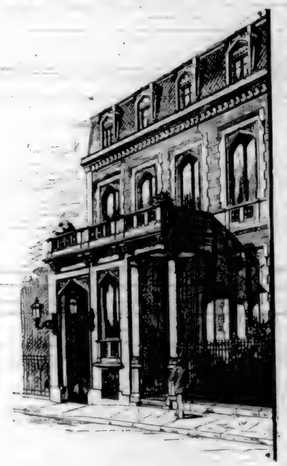
THE owner of one of a row of new houses saw a little girl taking observations on the street the other day and entered into conversation with her. "Oh, yes," she said, "I like these houses, but my papa don't." "Well, what fault has he to find with them?" "He says he cannot drive through this street because they frighten his horse."

Ancient Wood Carving.

AMONG the papers read at a meeting on Monday of the Society of Antiquaries of Scotland, was one on a wood-carver's tool box found in a bog in the island of Avie, Orkney, and exhibited by the finder. The box, which measures 11½ inches in length by 4¾ inches in breadth, and 3 inches in depth, is elaborately ornamented by a running pattern of diverging spirals, and other designs of specially Celtic character. The box was furnished with a sliding lid, which is now in fragments, and it contained a series of tool handles made of bone or horn, evidently for carving in wood, or some such purposes. The blades of the tools which have been of iron have entirely perished, but there remains in the box the piece of pumice stone with which the carver used to polish up his work. This box is one of the oldest bits of wood-carving known in Scotland.—*Ex.*

Pay of Architects.

NOTWITHSTANDING all that is said and admitted about the mercenaries of clients, the crudeness of popular taste, and the general lack of a critical appreciation of the merits of good buildings, the most serious obstacle to a due recognition of the architectural profession, by the public, is the unprofessional quality of a large portion of its membership, and often suggests a doubt whether they really know what professional conduct is. Witness the following transaction, of recent date, in a prominent Western city, where a couple of architects, in their eagerness to secure employment, sacrificed every consideration of personal profit and professional dignity. In the city of A it, is proposed to erect a $50,000 building for the Young Men's Christian Association, and part of the funds have already been pledged. Regardless of all professional etiquette, the firm of B & C, architects, addressed a written communication to the building committee, soliciting employment for this work, and offering to make "all the drawings, specifications, details, etc," and to superintend the building, *free of expense, regardless of what the structure may cost.* We are not informed of the final decision of the committee, nor of their opinion of architects who solicit work in this ignoble fashion, but the affair suggests a few very obvious reflections. As for the architects themselves, they could hardly occupy a more humiliating position than that they have voluntarily and gratuitously chosen in this transaction. Had they referred to similar buildings which they had designed and erected, or offered any other evidence of superior qualification for the work they solicit, their position would be different; but to make an appeal solely on the ground of the cheapness of their services, is, by implication, to confess that cheapness is their chief merit. A class of disreputable doctors often advertise, "No cure, no pay," but these architects have gone a step beyond the doctors in offering to take no pay in any event.



Capable talent does not go begging for employment in this gratuitous fashion. Architects who can command pay for their services are not apt to urge them, as a gift, on building committees. Moreover, employment secured in this mendicant fashion, seldom brings any profit or honor with it. The self-abasement at the start invites a series of slights, snubs, and bitter humiliations throughout. Good work, fairly paid for, brings most thanks and favors as well as most profit. The old plea that a man has a right to work for nothing, if he chooses, will not answer in this case. An architect is *ipso facto* representative of the architectural profession, and, as such, is not at liberty to solicit work, or otherwise conduct himself in a manner calculated to bring his profession into public contempt. After he has been selected as architect for a proposed building, he may contribute as large a donation as he chooses, to the cause, either in cash or in personal services; but to offer such donation or gratuitous service as an inducement for the award of the work to himself, is as disreputable in an architect as it would be in a lawyer or a physician. Such parties consciously set a depraved example, audaciously trusting to the superior honor and self-respect of their *confreres* for the success of their strategy. Were the custom to become general, of soliciting work in this manner, their sole ground of preference would be taken away. They would not dare inaugurate the practice, therefore, but for a confident belief that the most of the profession will be too honorable to resort to it under any circumstances. As for the committee, a sensible man would be very apt to inquire whether it might not be wiser, safer, and ultimately cheaper to intrust their work to a thoroughly responsible and capable architect, at a just compensation, than to risk the fifty-thousand-dollar building in the hands of those who intrusively offer their services for nothing. A good architect often saves more than the amount of his commission in his conduct of the work apart from the superior quality of the building. Moreover, it is contrary to human nature to work without pay, and when people in any business make offers of this nature, it naturally suggests suspicion of some stratagem by which they expect secretly to derive ample profits for their liberality at the expense of a confiding customer.—*Inland Architect and Builder.*

California Building Stone.

THIS is practically a *new find* in building material in this State, although long known and used in the locality of its deposit. One or more buildings are said to have been erected near the quarry, and the effect of time, wear and tear has fully proved that it is of superior quality, although that used for the purpose named was the top rock, below which a much better texture and quality of stone are found.

The specimen left in the office of this journal certainly appears well for all building purposes, whether as wall material, lintels, sills or otherwise. It is from the Valley Spring Quarry, Calaveras County. The color is good, light gray, lighter than the sandstone of Santa Clara County, and would make a very handsome contrast for trimmings in press brick fronts.

It is pure silex and silicate of soda, fine grained, easily picked, rubbed, tooled or shaped into ornamental forms. Blocks of any required size or dimensions can be quarried. It is of fine, even texture, very strong, approximating if not equaling that of the best granite, and can be worked at half the cost of granite. There are no muddy impurities in its composition, and exposure to the atmosphere simply adds to its hardening and strength. It is also said to be comparatively fireproof, and consequently superior over granite for columns and lintels.

This stone is not only suitable for all kinds of dimension and ornamental purposes, but splendid for ruble-walls, being much superior to brick in foundation walls.

The need for a stone possessing the qualities claimed for that under notice, has been long felt in California, and it is to be hoped that the material in question will fill up all hitherto deficiencies in the line of a good building stone.

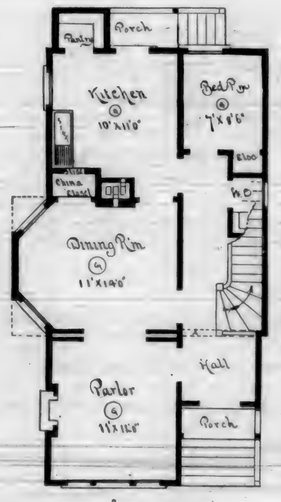
The quarry is reported to be extensive, and so far accessible to transportation that the rock can be delivered in this city at a very low price, as compared with the stone heretofore used in building construction. This being so, there seems to be no reason why it should not come into general use. The specimen in this office is free to the inspection of architects, builders, and owners contemplating the erection of buildings, and to all parties interested in the development of the State.

Examination a Pre-requisite to Practice.

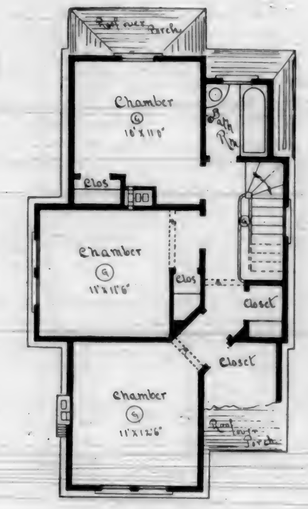
IN an article, "Essentials of a Building Law," the *Western Architect and Builder*, among other things, says: "No person should practice the profession of architecture without first having passed a satisfactory examination before the State Board, consisting of the State Architect, the Commissioner of Public Buildings, and such other members as may be thought best."

In the passage of any law or regulation enforcing the suggestion of our contemporary, which should be national in character, there would be terrible howling in present architectural circles, but not among the intelligent, experienced, and competent men who suffer daily annoyances, if not from direct competition and contact with the minnows that wiggle their tails in architectural waters, then from the innumerable innovations upon right and honorable professional practices, and the shameful abuse of privilege in departures from the consistent and true, and the substitution of the fanciful, wild, and extravagant architectural gewgaws, —not styles founded upon the time-honored orders, nor possessing any recommendation to place them on record as the legitimate offspring or result of architectural culture and refined taste.

If matters *could be* so regulated by legal, constitutional enactment as to prevent those not qualified from entering into practice,



First Floor Plan



Second Floor Plan

and imposing their services upon the unsuspecting and confiding, through false representations of themselves and their abilities to perform the responsible duties incumbent upon architects, owners, as well as qualified architects, and the profession as a whole, would be vastly benefited; for then men would understand that study, preparation, qualification, and the attainment of a proper knowledge of the innumerable details of the science, were an indispensable requirement, and those by *nature* qualified would seek every other necessary qualification.

Under such a regulation there would be no curtailment of privileges or opportunities to young men. The door of entry would be as widely open and free as now; but it would then be known and understood that the attainment of right and proper knowledge was a prerequisite to the privilege of assuming professional responsibilities as an architect, instead of, as now, any one who pleases, however little qualified, asserting claims to, and playing a part never studied nor understood by them.

Examining Candidates for Membership in the Kansas City Master Plumbers' Association.

A HARDWARE firm in a town in Kansas, desiring to go into the plumbing business, associated with themselves a man who claimed to be a practical plumber. This man made application to join the Master Plumbers' Association of Kansas City. A committee was appointed to examine the applicant and report upon his eligibility for membership. This committee sends us the following report of the examination:—

Question—Are you a practical plumber? Answer—I am.

Q.—How long have you been at the business? A.—About twelve years.

Q.—Where located? A.—Run shop four years at Greenville, O., and also at Bramptom, Canada; had in my employ fifteen men.

Q.—What are the different grades of lead pipe? A.—Light, medium, and extra strong; iron pipe the same.

Q.—Into how many pieces would you cut sheet-lead to line a tank 3x3x3 feet? A.—Five pieces, one for each side.

Q.—What would you do with the lead then? A.—Scrape it with a scraper, then paint the edges black and solder it.

Q.—What is the proper name for the tool you call scraper? A.—Why, scraper or knife.

Q.—What is the proper name of the black paint you mention? A.—Paint is the only name I have ever heard it called.

Q.—What are the ingredients in this paint, as you call it? A.—I don't know.

Q.—Can you wipe a joint? A.—Certainly.

Q.—Will you go now to Mr. Ford's shop and make one? A.—Not to-night, as it is two years since I made one.

Q.—How would you proceed to make a branch-joint, and what tools would you require? A.—Have forgotten the names of most of the tools.

Q.—How is a trap ventilated? A.—Never ventilated any.

Q. What are the different patterns of traps most commonly used? A.—Do not remember.

Q.—What is a hot-water circulation-pipe, and where used? A.—Pipe running from center of boiler to the top of the boiler.

Q.—What is a lead safe? A.—A pan under a water-closet to catch leaks.

Q.—Is there a pipe leading from the safe usually? A.—Yes, going direct to the sewer.

Q.—Are you sure you are a practical plumber? A.—Oh, yes.

Q.—What are the Philadelphia rules for gas-fitting? A.—There are no rules that I know of.

Q.—Did you work at plumbing in Chicago? A.—No; I was with the People's Gas Light Company.

Q.—You still claim to be a practical plumber? A.—Yes, sir, I do.

That is all. The above is a fair sample of the *practical plumber* found in the tin shops and hardware stores of Kansas; yet they have the unadulterated gall to apply for membership to the Master Plumbers' Association. The applicant was most respectfully told to stick to bell-hanging.

W. F. McCarthy,
Wm. Stockinger, } *Committee.*
John E. Ford,

[We are glad to learn that men of this class are not admitted to membership in the Kansas Association. We presume there is nothing to prevent this man from experimenting with plumbing work in the State of Kansas, but we hope the time will come when such men will not be allowed to attempt the execution of plumbing work anywhere. This applicant's answer to the question, where a pipe from a lead safe usually leads to, explains some of the illustrations that we give in this issue of dangerous plumbing blunders in Philadelphia.—Ed. *San. Eng.*]

We regret to add that there are very many of the Kansas City specimens of *practical plumbers* operating in San Francisco, who could not if they would, execute a perfect piece of plumbing work, and it is doubtful whether they would if they could. This class of mechanical incubuses—frauds in every sense involving skilled workmanship—are mere tinkers, lacking the natural mental necessities to qualify them to *understand* the laws of mechanical science, much less to *execute* them. The "scum of society" is often applied to certain classes, and with equal force and propriety, "mechanical scum" attaches to these tinker *practical plumbers*, who fail to exemplify more than the crudest forms of mechanical workmanship, without an approach to *skillfulness*, particularly in those matters in plumbing work which require the nicest conception and application of the plumbing art.

Since the adoption of the plumbing law in this State, this evil has been to an extent regulated, but not exterminated, until the really practical plumbers were driven to the wall by the aggressive methods of the invaders, who have worked themselves in as competitors with competent men. They made no move to reclaim their just rights, but yielded to the pressure, and learned to practice many of the mechanical connubiations by which their enemies managed to underbid and secure important jobs, as well as the greater portion of the smaller class of buildings.

Necessity finally led to the adoption of the plumbing law, which places a check upon the many rascally things practiced under the old personal privilege regulation. But the law is yet too mild, in that, while it restrains and controls the more important departments of sewer, soil, vent pipe, etc., work, it leaves it possible for the Kansas kind to operate.

The law, to be wholly sufficient for the purposes for which it was intended, should require and compel every *practical plumber* to undergo a rigid examination before a competent board of examiners, denying the right to practice, as master plumbers, to those not capable of answering correctly every essential question connected with or involved in the science of plumbing. Such examination would be an indorsement of competent men, and an exposure of those who, as a class, by their defective workmanship have been instrumental in prostrating thousands of their fellow-creatures upon beds of pain and suffering, and sending as many more to untimely graves.

Spare the Birds.

IN view of the great slaughter of birds in America for sportsmen's pleasure, and to gratify the demands of gaudy fashion, the American Ornithologists' Union has organized a "Committee on the Protection of North American Birds," consisting of Geo. B. Sennett, chairman; Eugene P. Bicknell, secretary; J. A. Allen, Dr. J. B. Holder, Dr. G. B. Grinnell, William Dutcher, and L. S. Foster, all of New York City; Wm. Brewster, Cambridge, Mass.; Montague Chamberlain, St. John, N. B., and Col. N. S. Goss, Topeka, Kansas.

The heartlessness with which millions of the feathered family are yearly destroyed, mainly to gratify the passion in the sportsmen of our country to shoot and kill birds, is incalculably great. The little innocents are shot at simply to illustrate the shooter's skill and proficiency with his gun, or for the mercenary purpose of supplying an article of extravagant ornamentation in the fashion world. And fashion, the foster sister of pride, the mother of untold evils in social and family life, demands its pleasings and gratifications with remorseless severity at whatever cost.

The object in view by the Union is the obtainment and diffusion of all possible information in reference to the magnitude of the slaughter of birds for mercenary purposes; the destruction of birds' nests, etc., etc.; to develop a public sentiment in favor of rigid protection of birds; to prevent the depredations of sportsmen and boys, and the destruction of bird eggs; to secure more perfect legislation leaving the game birds subject to reasonable season protection.

The committee requests the sending of facts and information from all sections of the country, to their head-quarters, at the American Museum of Natural History, Central Park, New York City.

Customer (entering unexpectedly)—"So, sir, I've caught you putting water in the milk." *Milkman*—"Yes—er—no; that is, sir, I'm only washing it. You don't s'pose I'm going to serve my customers with dirty milk, do you?"

The Late J. B. Gough.

ALTHOUGH the following resolutions have appeared in the daily journals, we deem it a fitting tribute to the memory of a truly good, and, in his life-time, distinguished worker in the cause of temperance and humanity, to give them a place in the columns of this journal.

Thousands have good and sufficient reasons for thanking God that this earnest man, full of devoted zeal and interest in the cause he so ably advocated, lived and labored so faithfully and successfully, with a power and influence for good not possessed by millions of other good men, influencing tens of thousands to abandon the vice of indulgence in strong drink, and turn their feet away from the paths which pursued, inevitably lead to a drunkard's grave.

If from the confines of the tomb his voice could be uttered, even louder and more earnest than in life would be his cry to the living, Touch not, taste not, handle not the accursed thing.

RESOLUTIONS OF RESPECT ON THE DEATH OF JOHN B. GOUGH.

The following resolutions were offered by Dr. R. H. McDonald and unanimously adopted at a meeting of the International Lodge of I. O. G. T., held in Grand Central Hall, San Francisco, Cal., March 1, 1886.

Whereas, An all-wise Providence has removed from the scenes of earth the illustrious and brilliant orator and devoted patron saint of temperance and prohibition, the justly renowned and beloved John B. Gough, therefore be it

Resolved, That we deeply mourn the loss that we, and humanity in general, have sustained in the death of the eloquent advocate, whose life was spent in incessant toil and tireless devotion to the uplifting of fallen humanity.

Resolved, That we tender to the bereaved and afflicted widow and family our heartfelt and sincere sympathy, and assure her that, in this case, her loss is our loss, and that we mingle our tears with hers in this great trial, but hope to meet him "beyond the river."

Resolved, That these resolutions be engrossed, and that a copy be furnished the widow and family of the deceased, and also for publication in the *Rescue*, *California Voice*, and other papers.

The following telegram of condolence was sent to Mrs. John B. Gough and family, by a Past Worthy Chief Templar of International Lodge, 291, I. O. G. T., of San Francisco, and was indorsed by said Lodge:—

San Francisco, Feb., 1886.

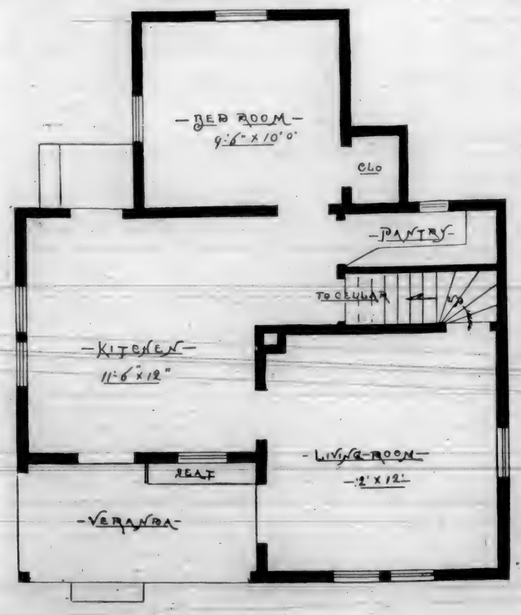
To the widow and family of John B. Gough, Boylston, Mass.—

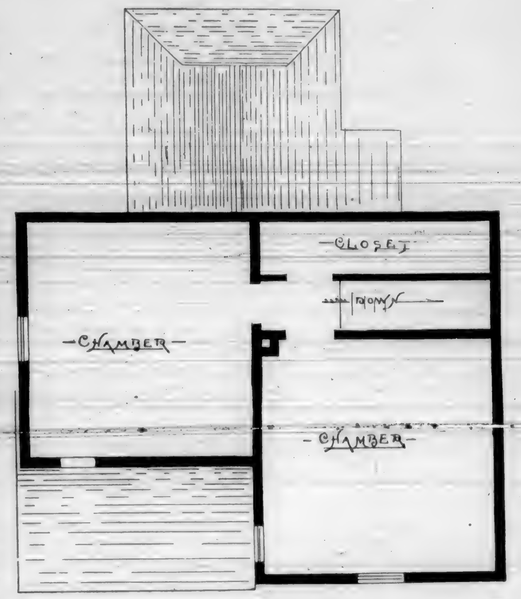
We mingle our tears with you, in this great affliction. Please put flowers on the body for us. We shall meet him "beyond the river." Our flag is half-mast. California mourns the loss of one so honored, so brilliant, so devoted, so true.

R. H. McDonald.

Secretary, Helena Young.

An oak mantel imported from England, made by a London manufacturer, bears in the center of its expensive, but plain, upper portion, which slopes backward, a warrior's steel breastplate and his trusty weapons crossed beneath it. Over the fireplace is a series of tiles, representing a troop of wild horses.





Not Fair Treatment.

THERE is in journalism, as in all other matters and transactions, a rule of right and fairness, which transgressed, is a wrong committed. These may sometimes occur without intent or design, but when frequently repeated, with plain and unmistakable opportunities to avoid them, the design and intent become transparent. This journal was the first, and to-day, is the only, or nearest reliable reporter of the building intelligence in San Francisco. So much so that the city papers generally, have used our monthly, quarterly, and yearly reports as showing the building activities, some giving us due credit always, and some occasionally, while at other times our reports have been appropriated as a whole in such manner as to make it appear that the statements made were the result of enterprise on the part of those journals, filching matter, which of course cost us considerable money and time to provide and prepare.

One of these most glaring illustrations of journalistic profligacy occurred in the *Daily Examiner*, in its issue of March 15, in which our quarterly report and tabulations were copied entire, word for word, and figure for figure, and the credit given to an obscure sheet that never originated a single fact or figure stated. There can be no reasonable excuse for this, as the journal in question was furnished with a copy of the California Architect and Building News containing said report, and had it wholly in its power to have avoided the miscredit, if it had been so inclined. It would have been a transgression of privilege to copy the item without any credit, but the appropriation of matter from these columns with credit to a source not entitled to it, and from whence it did not originate, makes it more than an oversight.

The Knights of Pythias Hall Association, by its officers, report 4,201 volumes of useful and instructive books in the library, being a gain of 268 volumes during the year 1885. Number of books issued during the year, to 1,420; readers, 12,568. The report shows a healthy and prosperous condition of things in this department of order work.

A portable bath, having a flexible rim or water-guard, which is to prevent the floor from becoming splashed, has been patented by J. H. Crocker, Brussels, Ont. The bath has an upright flange, from which four, more or less, radical arms are made to project. These arms support a strip of flexible material which completely surrounds the bath. The arms are held in place by means of enlarged heads that pass through wire loops attached to the upright rim.—*The Brooklyn Real Estate Review and Long Island Record.*

General Grant's book will be the best monument of the man; it will show every side of him and show him well.

Science of Architecture.

[Special for this Journal. By F. Hillert, Architect and Mechanical Engineer.]
(*Continued.*)

IN the formula designated, v v_1, the velocity of the air at a constant section, $2g = 19.62$, acceleration of gravity; H the height of the channel; T the temperature of the warm, t the one of the cold air current; L L_1, length of the distances to be conducted; D D_1, the diameter respectively the sides of the channel; U U_1, the circumference washed by the air current; F F_1, sectional surface of the channel; f, a coefficient of friction, = 0.024.

$$v \sqrt{\frac{2\,g\,H\,(T-t)}{273+t}} : \sqrt{1+\frac{2\,g\,f\,L}{D}}$$

When the channel is made of two unlike parts (f.i. of a horizontal or downwards directed and of an ascending channel) then is:

$$v \sqrt{\frac{2\,g\,H\,(T-t)}{273+t}} - \frac{2\,g\,f\,L_1\,v_1^2}{D} : \sqrt{1+\frac{2\,g\,f\,L}{D}}$$

Letters marked with ' are index references to the second channel section.

If the velocity v_1 can be expressed by v, probably $v_1 = \frac{v}{n}$ then is:

$$v = \sqrt{\frac{2\,g\,H\,(T-t)}{273+t}} : \sqrt{1+\frac{2\,g\,f\,L}{D}+\frac{2\,g\,f\,L_1}{D_1\,n^2}}$$

Is the section of the channel not square or circular, and can be set for $D = \frac{4\,F}{U}$. For more than two channels of different sections is in general:

$$v^2 = \frac{2\,g\,H\,(T-t)}{273+t} - \frac{2\,g\,f\,L\,U\,v^2}{4\,F} - \frac{2\,g\,f\,L_1\,U_1\,v_1^2}{4\,F_1} - \frac{2\,g\,f\,L_2\,U_2\,v_2^2}{4\,F_2}.$$

Ventilation by machine arrangement. Ventilation can be produced either by forcing in of air or by suction; the first is commonly known as "pulsation" ventilation.

Machine arrangements, in most instances, are only applied when, by the heating of the air alone, the required velocity of the same for a safe, effective, and good ventilation is not to be obtained, or when economy or the arrangement of the building should demand it. This can be the case, either with very extensive buildings, for which a central arrangement is needed, and a large extension of the horizontal channels is required; or with buildings whose rooms require a considerable change of air, and therefore necessitate very wide channels, difficult to locate and place; or when, for economical reasons, an unusually large heating of the escaping air would be needed, ventilation would be established by difference of temperature.

In general, for ventilation of buildings, the so-called "blowers" find little or no application, and mostly are used in the so-called ventilators for rooms for manufacturing purposes, where an intense noise made by the working is no objection. In limited number, the so-called "steam injector" ventilators are there applied.

The ventilator, acting either by pressure or suction, or acting by pressure and suction combined, are constructed as centrifugal wings, or as screw ventilators.

The number of the constructions of centrifugal ventilators generally employed is not a small one; the difference between them is mostly in the box and in the form of wings, which are either straight or curved. Ventilators with even wings are applied for small pressure; by higher pressure, in the interest of increasing the degree of effect, curved wings are used. The general requirements required of a good ventilator are a noiseless movement, the effectiveness at least 0.3, easy and convenient access for removal of the wings, and, lastly, a sufficient strength of the casing.

The number of horse-power N required for the running of a ventilator is direct proportional to the amount of air needed (Q) per second of time, and the pressure (h) expressed in meter by water column, and in reverse ratio to the real effect (e) produced.

$$N = \frac{13.3\,Q\,h}{e}$$

The general description of the ventilators are: a shaft, to which are attached either straight or curved wings, or wings of a sigmental screw shape, inclosed in a wrought or cast iron casing; to the shaft a quick rotary motion by elementary power is given; by it the air is drawn in at the center of the shaft, and by the action of the centrifugal force is thrown towards the circumference and discharged through an opening left in the circumference of the casing.

The steam injection ventilator depends on the action of steam passing from a narrow, small outlet to a wider pipe; the thinning of air hereby created in the latter, by which a suction of the air surrounding the pipe is produced, is then, with the current of steam, conveyed hence. Those ventilators find only application in buildings where the noise produced by the steam is of no disagreeable consequence to occupants of the room, as in workshops.

The use of the steam injector ventilator is proportionately expensive, but its advantage consists, that neither machinery nor transmission of motion is required, and the first outlay of procuring them and mounting are small. The effect can be seen by the following table: —

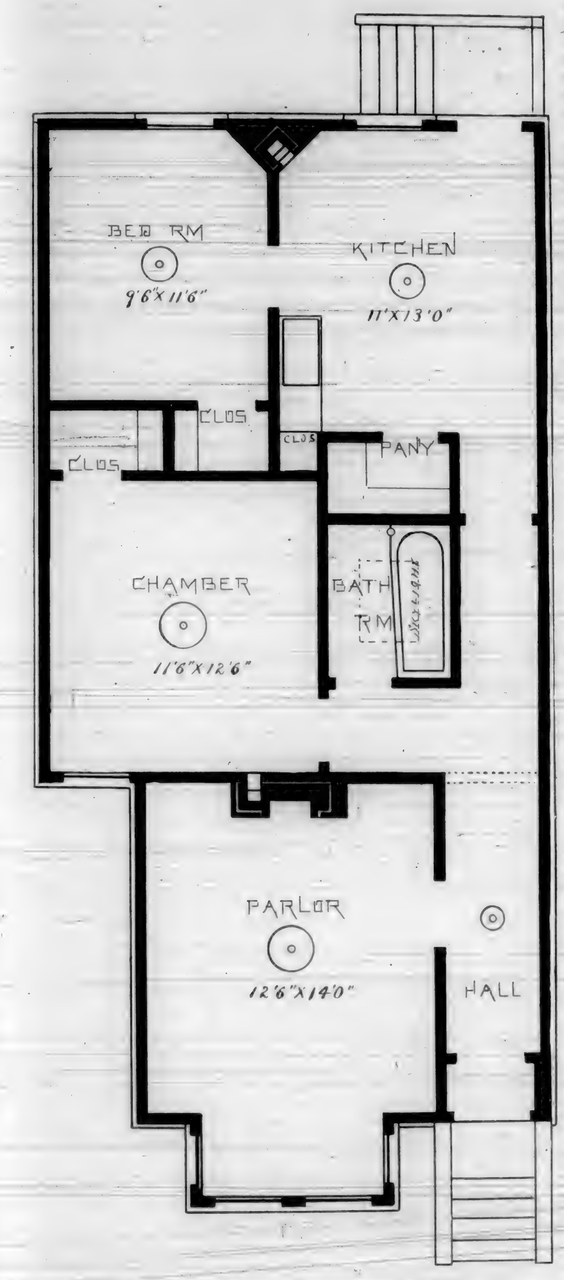
DIAMETER.		DISCHARGE OF AIR
OF STEAM PIPE IN MM.	OF AIR CONDUCTOR IN CM.	PER MINUTE IN CBM.
10	160	6
20	300	25
35	550	100
50	900	250
60	1100	400
70	1200	475
80	1500	625

Compression ventilators can be arranged for direct and indirect action, t. i., that either all air or only a portion must pass the ventilator. In the first instance the air-conducting channels are brought in direct connection with the discharge and only to be considered as a continuation; in the second instance the outlet of the discharge empties in the air-conducting channel, which is connected with the outside air. The air discharged from the ventilator produces a suction on the outside air.

As a rule, centrifugal — wing — ventilators are placed for the purpose of direct action. The placing of screw ventilators is done for the purpose of direct action. Ventilators for suction of air from buildingsare rarely applied. At most they are used as auxiliaries of other systems, since the arrangement of them is mostly complicated, therefore the working of them is difficult, and, in effect, compared with compression ventilators, gives a very unfavorable result. As a rule, it is found that, by the arrangement of compression and suction ventilators together, the first is mostly kept in operation.

With the mounting and placing of ventilators, every precaution must be taken that they are easy of access, and all parts to be open for inspection, and the bearings of the shafting to be convenient for lubrication.

The disposition of a ventilation arrangement for the application of ventilators, does not differ much from the ventilation by difference of temperature. At the lowest point of the pressing air column is placed the compression ventilator (the suction ventilator in the common discharge channel). When, with the calculation for the sections of the channels for ventilation, based on the difference of temperature in the first instance, is to be found the actual velocity, we have for ventilation with ventilators the advantage, to assume the velocity of the air within certain limits,



and from it to determine the sections of the air channels. It is always of advantage not to rate the velocity of the air too high, and grade, accordingly, the channel section smaller, making, consequently, the use and working correspondingly more expensive, the cleaning of the channels more difficult; and the danger of introducing dust into the rooms is increased and made certain.

In most cases of practical execution, the placing of vertical admission channels (the section of them having been decided on with the aid of ventilation by difference of temperature) offers no difficulties, when the arrangement of the horizontal common distribution pipes meets frequently with considerable hindrance and difficulties. In such instances it is recommendable, for ventilation with the use of machinery, to retain the sizes of the vertical channels calculated with the aid of ventilation with difference of temperature, and the horizontal distribution only in the sections to be taken smaller, to increase in them the velocity of the air.

For the correct calculation of the power required to drive a ventilator, it is necessary to know the pressure of the air, to reach the desired velocity of the same in the channels.

Ventilation of the most unfavorable instance is the one by which the drawing off of the air to above the roof, without heating the same, is to be effected, and by which, even in summer-time, a renewal of the air by the ventilator is to be safely secured.

We can consider the whole arrangement of the channels to be divided in two parts; namely, in the horizontal distribution channels, and in the vertical admission and discharging channels. In the latter exists, in winter-time, an ascending motion of the air; in summer-time, a tendency to settle. For the summer-time the ventilator, therefore, has to counteract, in all ascending channels, the falling motion of the air, as also to force the upward motion of the same. The channel, being the farthest off from the ventilator, is the one to be used for the calculation of the pressure of the air.

To v, the theoretical velocity of the air, which must exist at the bottom of the vertical channel farthest away from the ventilator, to supply the room with the required quantity of air, then is the velocity V, according to which the pressure of the air back of the ventilator is to be calculated.

$$V = v \sqrt{1 + \frac{\varepsilon\,(C_0) + C\,l}{d}}$$

$\varepsilon\,(C_0)$ is the sum of the coefficient of the resistances for all the changes of direction in the channels; C is the coefficient of friction = 0.024; l, the length of the air-distributing channels measured from the ventilator; d, the diameter of the channel. For aright angular square section with the sides = a and C is to be substituted for $\frac{1}{d} = \frac{a+b}{2\,ab}$ b.

The pressure corresponding to the velocity V in the ventilator is

$$p = \varkappa \frac{V^2}{2\,g}$$

Wherein p is the specific pressure of the air in kg. per square meter; $\varkappa$, the weight of one cubic meter of air: $2g = 19.62$, the acceleration of gravity.

Since the weight of 10,000 kg. corresponds to the height of a water column of 10 meters, p will in the same time be obtained as the height of pressure expressed in (mm.) milimeter. For the finding of the theoretical velocity v, are, as long as the vertical channels are computed and executed, with regard to the differing of temperature, the previous formulas used and given; v certainly must be obtained for the winter season as the mean of the ascending velocity in the admitting and discharging channels, while for the summer season, v must be calculated as the mean velocity of the ascending velocity, increased by the acceleration of gravity in the admitting and discharging channels.

On the Selection of a Ventilating System.—For the choice of a ventilating system, we have to consider and decide from case to case. There, where the utmost safety of ventilation is desired, it is earnestly to be recommended to make ventilation independent of heating; best to separate both arrangements.

The heating of the rooms is mostly done with reference to the outside temperature, while ventilation is dependent on the adulteration of the air, and the quantity of the same required; each must be accordingly arranged. For each arrangement different preliminary conditions exist, therefore, to work on.

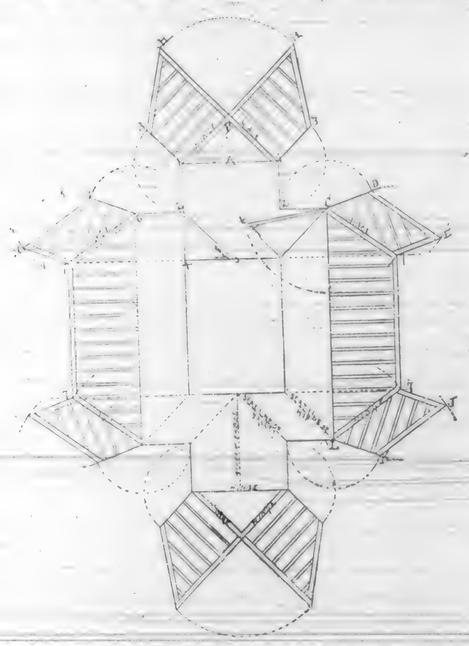
An important factor for the selection of a system is the condition whether ventilation is only desired for the winter season, or for both winter and summer. This condition, and the abovementioned separation of the heating from the ventilation arrangement, are frequently not sufficiently considered in execution. In the programmes set up for heating and vetilation, we often find the system of heating, as well as that of ventilation, the quantity of air to be renewed, decided without any previous investigation of the question, that by the arrangement of the system selected, the desired effect can be obtained. Before the adoption of any certain system, the building distributions are also to be considered, the highest outside temperature to be ascertained, up to which a full effect of ventilation can be reached. By the highest outside, the most unfavorable temperature for ventilation is then to be concluded, which ventilation system for the case under consideration is to be adopted. Self-evidently in the arrangement, that system will have a deserving preference which is the most simple in execution.

Since hereby the distribution in the building forms a question for consideration, even for buildings serving the same purpose, frequently different systems are applied, and for this reason it is advisable to employ competent persons for the designing of the ventilation project. The designing must be done in time, that the required alterations in the plans can be effected.

Addenda.—To measure the temperature of the air, etc., quicksilver thermometers are used. The measure of the temperature depends on the expansive capacity of a fluid, either ether or quicksilver. The fluid to be selected for thermometer must have a uniform expansive capacity, that is, for the same amount of increase or decrease of sensible heat an equal amount of expansion must be obtained.

Editor of California Architect—*Dear Sir:* I herewith furnish a graphic illustration of a hip and gable roof, similar to that appearing in the January number of your journal, by which the roof covering of the ground plan can be found unerringly.

First, draw ground plan to any given scale. Set up the height of roof, say A B, then draw the seat line of both the hips and valleys, on the ground as shown. Square up from the seat line of hips, and set up the height of roof as elevation A B.



Connect C and B, which gives the length of hip rafter. Square out from the deck line, 7–7–7–7. Take the compass and stand in C, and open up to B. Describe curve cutting at 7. Connect 7 and C, then C and 7 is the length of the hip rafter that will stand over C A in the ground plan in position.

—Come back to A B, draw the common rafter or gable end, and square out from common rafter as shown. Take the compass and stand in 1. Draw the curve from 2, cutting the line squared from the common rafter at 3, each side. Take the compass and stand in A; open out to the face line of deck, and with that distance stand in B and cut the lines marked H H; then connect H and 3 each side, and H and 3 will be the length of valley rafters, to stand in position over 2 5 in ground plan.

This brings the problem to the most difficult cut in the structure,—the finding of the correct lean. Draw a line from 2 to X in the ground plan, and set up the height of elevation; connect 2 and 5; take in the compass, the distance 2 5, and move over and stand in 7; draw the curve marked 8; come to number 6; stand in 6 with the compass, and open out to number 2, and draw the curve cutting at 9; connect 6 and 8, which will give the correct incline or lean of timbers. The outside commencing at 1, cut to 3; from 3 to H; from H to B; from H to 3; from 3 to 1. Cut from C to D, to E, to Y, to J, to K, to L.

Now weaken at where hinge is printed, and fold from you, and stand up on the ground plan lines. This will give a model showing every timber in place, and, in fact, give a better illustration of construction than pages of written explanations.

M. J. Marion.

The Professing Architect, as Seen by Some Others.—Men who live in houses do not build them; they hire them and have a hope—which by this time cannot be called reasonable—that the landlord has built with a view to comfort. Not so; he builds with a view to money, and the tenant suffers every day of the year, because the simplest precautions have not been taken in building to meet the changes arising from variation in temperature. It may be wrong to blame the landlord, or even the speculative builder, when the right person to blame is the architect. So far as the outside world may judge, the profession of "architect" is, from first to last, a delusion and a snare. The only thing the "professor" is good for is to blackguard the Government (or municipal authorities) or private individuals, over every bit of work done. No work is ever done by the right person, or is well done. The latter is unavoidable; for what capitalist can decide as to the right party, or how can the man act freely when selected, when every other member of the profession is like a tom-cat, snarling at every design as a whole, and at every detail in the design? Who ever heard of an architect paying attention to common-sense suggestions in designing the miles upon miles of houses in the towns of England? And surely some architect has been consulted in the majority of cases. The aim is to make a something to look at from the outside, while comfort and convenience are of no import.—*Contractor.*

Abrogation of Treaty.

THE speech of the Hon. John H. Mitchel, of Oregon, before the Senate of the United States, February 26, 1886, if in any part at variance with the laws of nations, or questionably strong upon the matter of abrogation of treaties, it nevertheless enunciates the correct and only true doctrine applicable to the Chinese issue. If the presence of Chinamen in the United States is an evil, and such it is known to be to every man who understands and comprehends the whole matter in its full and correct light, then any necessary measure calculated to crush out the evil is legitimate, and no fancy philosophy of treaty obligation should be permitted to intervene. As a matter of course, "silver-tongued" orators, and minds and intellects capable of glossing over and beautifying surfaces, and concealing the underlying and material facts of any issue, may work up appearances to a degree that will make the true seem false, and the false assume the brilliancy of truth. Fine-spun arguments and theories, covering special points, or spread out over all creation, are often made to appear as gilded certainties; while in real fact the structures so reared have no foundation below the surface. Many of the social evils, which are revolting to every refined mind, judged from the standpoint of moral rectitude, are surrounded and impregnated with alluring and pleasurable argument—so much so that millions of men and women the world over, accept them as good, and blind their eyes to underlying facts and consequences.

So in reference to the Chinese question, many good men and women who look only at the comitig, theoretical, humanitarian, Christianizing side of the issue, fail or refuse to go below these superficial aspects of the case, and hence are in total darkness and blindness as to true merit. If these "poor heathen" are to be pitied and helped by the people of the United States, that call of mercy is as loud and strong to every other Christian nation, and we fail to discover the obligation resting specially upon us as a people, to accept the whole burden that should be distributed over every civilized land, in permitting the hordes of slaves, and

the minions of vice, idolatry and heathenis from China, to swarm this grand and glorious heritage, which God in his great goodness has intrusted to us, filling it with every good and happifying thing, and making it, as it has been and is, a light to the world, whose beams of freedom and prosperity have shaken, and are at the presen moment causing the thrones of kingdoms and empires to tremble, and the down-trodden of earth to see and claim their individual rights.

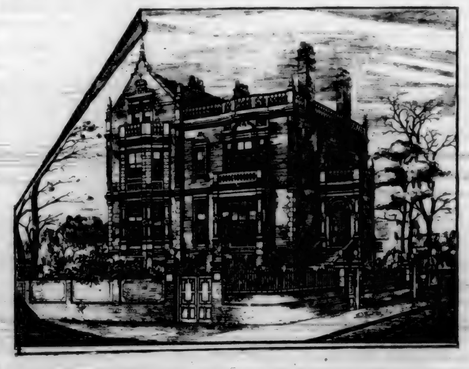
If we keep the Chinamen at home in their own land, then this nation will be able to help them. Millions of money and thousands of self-sacrificing missionaries may be sent to the flowery land to teach the children of the sun—the followers of Confucius, better things, nd establish among them the royal principles of a holy religion, and assist them to raise themselves as a nation, to that higher plane of life enjoyed by the Caucasian race upon this great continent. But if they are permitted to swarm hither, as they will by millions unless the avenues are barred, the period is not long distant when they will assume an attitude of fearful consequence, controlling labor, mechanical, and financial interests to such an extent that the dragoon flag will float on every breeze from ocea to ocean, and the triumphs achieved by them will but stimulate the pride of victory and rebellion against our institutions more bitter and relentless than was ever known in the internal conflict of nations. Chinamen have no love for Americanism, beyond its gains and profits, and with these at their command they will spurn ou philanthropies, hate our religion, despise our institutions, cling to their idolatry and vices, and make this, the land of the free and the home of the brave, the revelling place of all the abominations that at present curse and degrade the people of the Chinese Empire.

These are the *possibilities*, with open ports and all restrictions upon Chinese immigration off. China can spare twenty or more millions of her subjects, and with free entry and general encouragement in trade, manufacture, commerce, etc., it would be a matter of but limited time when their numbers in this free land would reach in millions what they now do in hundreds of thousands. And with this increased number, and a like multitude coming, and waiting daily to come, with full privileges after arrival, the white man would indeed be compelled to hang his harp upon the willows and weep over the desolation of his once happy country. The comparative few who have come among us have practically solved this apparently problematic question, and clearly and unmistakably indicated the results that would follow the influx of several, if not twenty, millions of the race.

But such a state of things cannot, will not arrive. The effect of Chinaism upon the interests of the country is too well defined and certain, and is too well understood by a sufficient number, to be permitted to longer rest in peace, and prosper. And if delayed for a period, the time will come when the safeguards against this gigantic monster will be made so strong that our working people, manufacturers, and others, will be secured against Chinese encroachments.

The Working Classes as Drinkers.

THE terribly pernicious and demoralizing habit of indulgence in beer and whisky drinking by millions of wage-earners in the United States, with the number many times multiplied throughout other parts of the world, is one of tremendous proportions and magnitude. Although, strictly speaking, this may be a matter of personal, social, moral and physical import, its effects and result so far impregnate and enter into and affect mechanical, professional, and all other circles of brain and muscle workers, that class journals in whatever interest published, as well as those devoted specially to moral and reformatory matters, are fully justified in any reference to the subject calculated to show up the resultant evils, and cause—if, perchance it may be so—some to consider the folly and injuriousness of the habit, and to view it in its true and too often fatal light.



The living evidences of mental and physical wreck and ruin through indulgence in intoxicating beverages, are in numbers, beyond all computation. Millions of otherwise most noble and excellent men, capable not only of mastering the intricacies of the mechanical and professional arts and sciences in their unlimited forms, features, and applications, but of filling, honorably and well, high positions among their fellow-men, in social, business, and domestic life and relationship—men of courage, genius, and nobleness of soul and nature,—become weak and puny slaves,—submissive, pliant vassals to an unholy and base mastery,—the indulgence in that which has destroyed more of human life and happiness than all the bloody wars of time, and the pestilences, famines, floods, fires, and destructive agencies that have visited earth's surface since the day when the juice of the first apple was tasted by the woman in Eden's garden.

It is fearful to contemplate the vast number of men badly damaged in purse and person by the use of alcoholic and malt beverages. The practice is almost universal, especially among certain classes of working people, who make "swill-tubs" of their stomachs through weakness in themselves to regulate and control an insatiate appetite for drink. The man of strong muscle and sinew arm becomes a feeble, pliant, moral coward, daring not to assert and exercise the noble prerogative of a man, even over the one little string in his make-up—a perverted taste for alcoholic or malt liquors. It is shameful and painful to see so many men bend and give way to a habit which curses always; blesses, never. Its blight is seen in nearly every workshop where the hardy sons of toil meet to labor, and in all assemblages where they gather to discuss questions relating to their labor rights and interests; and the contentions and disagreements that so often arise in such connections are stimulated and promoted by the disordered conditions of mind produced by the use of fluids not found in the laboratory of natural things, except by and through the manipulations of mankind, in changing and producing from the (in themselves) harmless, health-preserving, and life-sustaining fruits, cereals, berries, and products of the earth, to produce poison for souls as well as bodies. And still sadder, the shadows of the same curse darken the homes, the citadels where love, devotion, and sacred peace alone should be found,—of millions of families, rending and sundering ties, and casting down in sorrow and discomfort, if not in positive misery and debasement, wives, sons, and daughters, and making him who should be loved and honored as the strong support and defense of the home circle, a creature to be unloved, if not shunned and despised, as much as pitied. For he who, by willful, continuous, unmanly submission, yields to temptations and practices full to overflowing with evil, and destitute of any and every attribute of goodness, places himself in the attitude of a willful transgressor, and merits not those considerations due, or which it would be reasonable to extend to those who err, repent, and forsake their errors.

Whether so much so in other cities as in San Francisco, we are not prepared to say, but the fact with us is that, admitting the theory of St. Paul to be correct, that "a little wine for the stomach's sake," is good, the thing is overdone. Tens of thousands of men who devote their lives to manual labor, to keep within the measure prescribed by the apostle, "a little," would require food and drink receptacles as large as the pouch of the unfortunate Jumbo; and in far too many cases, the masters are but little behind the servant. Nor does the evil stop at these limits, but is found among those not wearied by hard strain upon the muscular forces; among men devoted to intellectual and professional pursuits, where the mind is in continuous exercise with subjects and matters which should inspire refined thought and develop control over every wrong doing, and every disposition and feeling calculated, if exercised, to work a moral or individual injury.

It may "do no good" to thus refer to this monster evil, but it affords conscious satisfaction that we have performed a simple duty, and that—from purest motives toward the large number of men in all pursuits, with whom business relationships enforce contact.

French Polishing.—The surface of woodwork, if the woods are valuable, is furnished by French polishing. A solution of shellac is put on a rolled wooden rubber, which is then covered with linen, and a drop of linseed oil is applied to the outer surface. The solution is rubbed in with a circular motion in successive fine coats, until a glossy and air and waterproof surface is obtained. French polishing preserves woods liable to split, such as oak, from the too rapid action of the air.

A Library of Wooden Books.

ONE of the most curiously original collections of books in any library is said to be a botanical collection at Warsenstein, in Germany. At first sight, the volumes appear like rough blocks of wood; but, on closer examination, it is found that each is a complete history of the particular tree which it represents. At the back of the book the bark has been removed from a space large enough to admit the scientific and common name of the tree, as a title. One side is formed from the split wood of the tree, showing its grain and natural fracture; the other shows the wood when worked smooth and varnished. One end shows the grain as left by the saw, and the other the finely polished wood. On opening the book one finds the fruit, seeds, leaves, and other products of the tree, the moss which usually grows upon its trunk, and the insects which feed upon the various parts of the tree; to all this is added a well-printed description of the habits, usual location, and manner of growth of the tree.—*Decorator and Furnisher.*

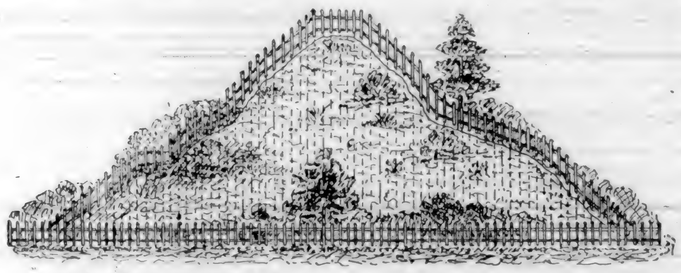
Picket Fence over or Through a Hill.

EDITOR OF CALIFORNIA ARCHITECT: Will you please decide, in your journal, the following dispute. A says that it takes no more pickets to build a fence over a hill than it would to build a level fence in a tunnel running through the same hill.

B contends that it will take as many more pickets in the over-hill fence as there is number of feet greater than at a level line; that is, if the distance from two given points is 500 feet through the hill, and it requires a rope or line 1,000 feet long to go over the hill from and to the same points, the number of pickets will be double, the pickets being spaced the same in both cases.

PICKET.

Answer.—A is right. The same question has repeatedly been asked of this and other journals, and in a former issue we exemplified the problem by the following cut:



As will be noticed, the pickets being put on vertically in both cases, spacing them the same distance, the pickets of the hill fence occupy the same relative position as those in the level fence, as far as the horizontal distance is concerned. It matters not how abrupt or high the hill may be, the vertical lines and spaces being observed—say three inches apart—the same number of pickets would be required in either case. The confusion arises from the fact that the measurement over a hill is greater, and at first thought any one not posted is likely to arrive at the conclusion that, with two pickets to each foot, 1,000 feet must necessarily require 2,000 pickets, while 500 feet on the level measurement would require but 1,000 pickets. The longer measurement *over* the hill applies to *rails* only, which in either case must be equal to the measurement from point to point.

Ventilation of Schools.

BOSTON, March 1, 1886.

TO THE EDITORS OF THE AMERICAN ARCHITECT—*Dear Sirs:* I did not intend to intrude upon your paper again, although, when I read your comments of my communication on the above subject, I began to think that the study I have made of the subject of heating and ventilation of school-houses had not been very profitable, or else your comments were not in accordance with the facts in the case.

We cannot tell what architects could or *would* do, but only what they *have* done; and I still contend that to Mr. Vinal, City Architect of Boston, belongs the credit of the best ventilated schools in New England, with the exception of Mr. Brigg's school, which I consider to be a fine example of scientific ventilation. You speak of the Worcester High School as an example of a well-ventilated building. The following is what Dr. Lincoln has to say about that school-house:—

"*Worcester High School.*—A large and pretentious building of brick and stone on prominent rising ground. The rooms are very high. The doors opening to the rooms are kept open to the very wide halls, and the air is not distinctly bad, though somewhat close. There is a considerable number of flues *not heated*. There is a large room used for drawing by fifty scholars, and once a week by ninety, which has *no ventilation*, and is *probably close*. The hall in the upper story is rather dark, owing to the lowness of the windows. The chemical library is neither well lighted nor *well ventilated*. The cellar is very large, and badly lighted. It is too wide for lighting. It is used by the boys for play, and is not a very desirable place. The same want of light is found in the water-closet in the cellar. The room for the boys' clothes, also in the cellar, is very neat and convenient, but has *no ventilation*."

Those who have made a study of scientific ventilation know that a lot of foul-air flues in a building do not of necessity secure ventilation, and, to say that considerable attention has been paid to ventilation, often means nothing more than that a lot of tin pipes or flues have been placed in a building to carry off the bad air, if it is disposed to go that way.

I do not think any ventilating engineer or practical man would care to provide for more than thirty cubic feet of air per minute per scholar, in the *winter time*, at least, as to produce more than that would be a needless waste. In regard to using fans for ventilation purposes, there are fans and fans, and the writer has only to say that those now in use in five of the Boston schools are not likely to be stopped, either on the account of expense or the neglect of the janitor. Regarding the expense of fan ventilation, Professsr Trowbridge, of Columbia College, is authority for the statement that a given amount of air can be moved cheaper, at all times of the year, by means of a fan than by an aspirating shaft.

EXPERIENCE.

[We are not yet convinced that Mr. Vinal and "Experience" are the only architects in New England who have made "a scientific study" of school-house ventilation; but we leave the matter for those who have done so, if there are any, to come forward and defend themselves against "Experience's" imputations. In regard to the Worcester school-house, it is, however, only fair to Mr. Richardson to say that the drawing-room and chemical laboratory are probably placed in positions not intended for any such purpose, and it is not necessary to infer from Dr Lincoln's description that the architect did not intend to have some means provided for securing a movement of air through his flues, whatever may be the present method of carrying on the building.—EDS. *American Architect.*]

San Francisco Chapter of Architects.

THE regular monthly meeting in March, was held on the 5th, with President Curlett presiding, B. E. Henricksen secretary, and a good average attendance of members present. After roll-call, reading and approval of minutes, and reports of committees, a general discussion ensued upon several matters of interest.

1. The necessity of the Chapter knowing its actual strength in paying membership. This point was dwelt upon as one of great importance to the welfare, and usefulness of the Chapter. A number of names of practicing architects appear on the roll, who never put in an appearance at the meetings, and who as much neglect the payment of yearly dues. This throws increased responsibilities upon the active, interested members, and, for the time being at, least, thwarts and hinders carrying into practice the many grand objects and purposes contemplated in and by the organic laws of the institution.

2. The necessity of having a room devoted to the special uses and purposes of the Chapter. As to the importance of this, there was no dissenting opinion. Beyond question, a head-quarters, a "home" for the Chapter would be a strong link in the chain of its future usefulness. But to procure a suitable room, furnish and equip it in such shape as to make it a pleasant, agreeable, and instructive place of meeting for personal resort, etc., will require more money than the present resources of the Chapter will furnish. The question then, under such circumstances intervenes, How shall the funds be raised to meet the emergencies? Shall the few dip deep into their pockets to furnish the required coin? More generous and more creditable to a time-honored profession would it be, that every reputable architect upon the Pacific Coast—especially those in San Francisco and California—unite in membership and bear an equal part of the financial burden, by the payment of such amounts of yearly dues as may be necessary to carry on and out the Chapter work, objects, and purposes.

3. The constitution provides among other things, that in cases where students employed in offices of members of the Chapter, who travel through our own or foreign lands for the purpose of perfecting themselves in the higher studies and practical observations of the science of architecture, the Chapter may, in its discretion, extend to such students financial aid and assistance, requiring in return that such student consider himself, to a certain extent, the *protege* of the Chapter, and make regular reports of all such matters and objects coming under his observation as might be of interest to the profession on this coast.

In this connection is the case of Mr. Stone, a San Francisco student, who has made for himself a most enviable reputation as an earnest, persistent, and determined worker, with every energy taxed to its utmost to prepare for reputable, honorable, and successful future practice. Mr. Stone is about to leave for the East and Europe, and is the first to offer the Chapter the opportunity to carry into practical effect the provisions of its own laws. A committee, consisting of the class teachers and the president, was appointed to consider the matter and report.

THE APRIL SESSION OF THE CHAPTER

Was held on the 22d instant, and was largely attended, President Curlett presiding, and B. E. Henrickson, Secretary.

The proceedings were marked with more than usual interest. After disposition of minutes and reports of committees, propositions for membership as fellows were received from Messrs. C. I. Havens and David Salfield, and referred to proper committees.

Mr. Macy suggested the propriety of the Chapter adopting a form of diploma, or certificate of membership, suitable for framing, to be distributed to such fellows of the Chapter as may desire to possess that form of evidence of ho orable membership. The matter was referred to a committee consisting of Messrs. Macy, Sanders, and Whittemore.

THE GIRDER.

At this point, Mr. Sanders occupied the floor for the purpose of reading a paper relating to the matter of girders. The theme reviewed and discussed in Mr. Sanders' reading was not exclusively the girder, but a range of thought embracing much of interest in an architectural and civil engineering sense. Mr. Sanders presented a number of hastily prepared sketches of girders, simple and compound, which explained themselves at a glance to those present, as to their generally understood and common uses and applications.

We had hoped that Mr. Sanders would have been able to prepare a set of girder sketches, such as might have been reproduced in the columns of this journal, and a treatise on the same for publication. But press of business engagements prevented this, and we have one less valuable article and exhibit for this issue than we fondly anticipated. Mr. Sanders was requested to pursue the subject and entertain the Chapter at an early subsequent meeting.

An animated general discussion followed the reading, in which many good and practical suggestions were made bearing upon girders, building construction, sidewalk beams, the lateral and compressive qualities of wrought and cast iron respectively, and other pertinent matters.

FROM LONDON.

Mr. Smith, from London, being present, was invited to participate in the talk, which he did with profit and pleasure to those present. Among other things mentioned by the gentleman in reference to girders was that, owing to the well-known fact of the expansion of iron by heat, iron girders are rendered less desirable in building construction, and the greater the length, the greater the objection; while wooden girders, unprotected, burn out as do other parts of the inflammable material, and in both cases walls are thrown down, or so badly sprung or damaged by conflagrations as to require being taken down, which would have remained good and sufficient for reconstruction purposes, but for the girder difficulty.

CASING WOOD GIRDERS WITH SHEET IRON.

As a remedy for the two evils mentioned, Mr. Smith stated that in his part of the world, wooden girders were more generally used in the class of buildings not constructed as a whole or generally of indestructible materials; but to render them preferable, a casing of sheet iron is applied, which makes them practically imperishable in cases of fire.

PIT PROTECTION FOR SAFES.

The gentleman also alluded to the fact that in the great metropolis of the English nation, as an absolute fire and burglar-proof protection to safes, pits are sometimes constructed of the required depth, with hydraulic attachments, of suitable power, presumably similar in action to the hydraulic ram elevators in use in San Francisco; and after the business of the day is over, the safes are secured and then let down into the pits, below the desired level of floor or ground, to remain until lifted again for purposes of business. In this way, all the securities afforded in first-class fire-proof safes are enjoyed, with the additional protection of being virtually buried up in vaults or pits below ground, so as to prevent the slightest effect from fire, and certainly largely increasing the impossibilities of burglarizing.

Altogether, the April session of the Chapter was one of the most interesting and profitable that marks its history.

If the honorable members of the profession, as a whole, would join in the Chapter work, and unite and co-operate heartily and unselfishly for its advancement and building up, in a very short period of time San Francisco Chapter would rank high among the many organizations working in scientific and professional interests; and, as far as its special object is concerned—the science of architecture—it would be regarded as the one great authority in that direction. Its doors are open, and its approach crowned with the word *welcome*, to every worthy and honorable member of the profession upon the Pacific Coast.

Literary Notes.

THE March 6th issue of *Building* contains the second paper on "Slow-burning Construction," by W. H. Dabney, Jr., architect to the Mutual Factory Fire Insurance Companies, of Boston; the continuation of Mr. Warren R. Briggs' excellent series of articles on "The Planning and Construction of School-houses," with plans and perspectives of a model suburban school. Mr. Wm B. Tuthill, architect, continues the discussion in his articles on the "City Residence, Its Design and Construction," of various plans for apartment houses, including what is known as the Duplex system. Various plans of apartment houses are given in the text. Mr. J. Pickering Putnam, well-known through his "Lectures on the Principles of House Drainage," speaks of the necessity of thorough ventilation for soil pip s and waste pipes, and of the evils and objections to special trap ventilation, in his article on "Improved Plumbing Appliances." There is also an illustrated article on the Street Memorial, in the Royal Courts of Justice, London, a Book Review Department, the Weekly Report on the Real Estate Market, a trade supplement reviewing the industrial progress, and a four-page supplement of the Building News of the week, besides editorial comments on the topics of the day. In the illustrations, sketches are give n for small laborers' cottages, for a country church, details of a staircase hall, for a city house, finished in oak, and the perspective view and plans of the new Club House for the Elmira Athletic Association.

THE March number of *Art and Decoration*, an illustrated monthly devoted to interior and exterior ornament, contains some very interesting articles on colors, imitation stones in ornamentation, interior sketches and decorative Japanese work, and many short articles, valuable and interesting. This journal should be in the hands of every one interested in art decoration. Subscription price, $2.50; single copies, 25 cents. Published by Art and Decoration Company, No. 7 Warren Street, New York.

Brick, Tile, and Pottery Gazette, heretofore appearing as *clay*, comes to hand in new dress and arrangement, with fourteen pages of interesting reading matter, and a range of advertisements comprehending all machinery used in the working of clay, and the manufacture of drain pipes and pottery devices. Subscription price, $1.00 per annum. Ottawa, Ill.

Be Thorough.

"A LICK and a promise," is the way the botch calls it. "That will do for the present," is what the procrastinator says as he half does some job. Young man, you are not to live for the present, but you are to build for the future. If you would be a success, be thorough. Are these school days with you? Get your lessons thoroughly. You will not only be better prepared for what follows by getting the lesson of to-day thoroughly, but you will acquire a habit that will be valuable all your life. If you are a mechanic, or farmer, or clay-worker, remember that whatever is worth doing at all is worth doing well. Be thorough!—*The Clay Worker.*

Good Houses.

EVERYBODY who builds, either for resident or rental purposes, wants a *good house;* a something which to obtain is worth a certain sum of money, and generally more than the amount appropriated and fixed upon in the mind of the owner as the sum to be expended. No one is wise who invests his money in any other than a good building. It may be plain and small, but the quality of material and workmanship should be considerd in the light of permanency. Houses are seldom built to last for a short period; they are generally supposed to be a permanent affair, to last not one, but several generations. And if from motives of present economies, an imperfect and shoddy structure is reared, the continuous necessities to keep it in repair but demonstrate the unwisdom of not making it good and perfect at first. The old saw, of penny wise and pound foolish, applies forcibly in such cases.

But the rule is that but few owners calculate to pay the actual value of a *good* building, leaving any profit to the man who builds. There is never an objection to the *goodness* proposition, but there is to paying the price necessary to obtain the result. The allowance for profits to the builder is seldom equivalent to the actual cost, with compensation to him who gives his time and mechanical skill to the work of construction. No one "*wants the builder to lose anything,*" yet but few are so earnest in this regard as to be willing to add enough to the amount fixed upon, to insure profit to the builder.

In building houses, as in the purchase of goods and merchandise, he who builds or buys cares but little about the real cost; it is the economies of the bargain that influence the transaction. Consequently, architects and builders, to meet this economy feature, must shave the *good* idea down as thin as possible, and mix in only so much of the desired ingredient as may be absolutely necessary to give tone and color to the structure. Hence the majority of buildings are less than *really good,* and some that have been predicated upon the *good* basis are mere—comparative shams. Yet the deceptive allurement of having obtained a building within certain limits of cost, very often satisfies the conceit of *goodness* and bad defects pass unnoticed.

This is a common experience, relieved only by the occasional cases in which owners in reality stand by the proposition of goodness, and supply the necessary funds to pay full value for a *good* thing.

OBSCURE HEAT.—At the Albany meeting of the National Academy of Sciences, Professor Langley reported on the progress of remarkable researches with the bolometer, by which he has so greatly extended our notions of the invisible spectrum. This time he dealt with the lunar spectrum, and estimated the heat derived from the unillumined moon. Rosse has estimated the temperature of the moon's surface as from 200° to 500° Fahr. By studying the moon at its full, with a rock-salt prism obtained only after repeated failures, and which from its nature had already required repolishing seven times, each time necessitating a new determination of its constants, he had succeeded, on repeated occasions, in securing a spectrum which showed two curves—one according with that previously obtained in the infra-red region beyond the visible portion of the solar spectrum, clearly due to reflection, and another, lying entirely beyond that, as clearly due to the moon itself, and revealing its real temperature. This, as shown by studying the spectrum of frigid masses, is colder than the temperature of melting ice. By comparing the mean of the spectra obtained in summer with that of those obtained in winter, it is evident that a much greater amount of heat is obtained from the moon in winter than in summer. This may simply be due to the greater amount of aqueous vapor in our own atmosphere in the summer as contrasted with the winter clarity. By directing the bolometer to the zenith and the horizon, the temperature of space has also been measured by direct experiment for the first time, and the amazing transparency of our earth's atmosphere to radiation of the earth's heat revealed; for his experiments show that our atmosphere transmits the earth's heat more readily than the sun's.

SOME of the famous staircases described by travelers and historians, in dimensions and general magnificence, so far excel anything to which designers and builders ordinarily have access that it is almost impossible to picture to the imagination the features of the work. Some staircases which are specially noteworthy on account of their dimensions, occur in the palace of Persepolis. One staircase leads from a plain in the beautiful valley of Bendamir to the summit of a terrace, out of which it is taken. It consists of two sets of two flights of stairs, each with a broad landing stage between them; the two lower flights diverge to the level of the foundation; the two upper converge to a common landing place at the top. The shallowness of the pitch, each stair being only 3 or 4 inches in height, constitutes an ascent so easily graduated that horses may be ridden up and down, while the width of 22 feet admits of a cavalcade of 10 abreast. Less noble in size, but distinguished by the character of its ornamentation, is the next staircase which opens to the view, somewhat out of line, when that just described has been mounted. It conducts to the summit of the central terrace, and is composed of four single flights, two of them being central and facing each other, the other two standing on either side of these at about 21 yards distance from them. The entire length is 212 feet, the width 16 feet, and there are 31 steps in an ascent of 10 feet. It is flanked by an immense parapet wall, surmounted by a massive rounded coping of elegant carved work, which overlaps the wall on the inside; the ends and the entire face are covered with sculptures, and exhibit a long procession of colossal guardsmen armed with spears.—*Carpentry and Building.*

A LITTLE white oak tree, growing in an ordinary flower-pot, makes a very pretty ornament for a window or front yard. It is very easily grown. Select a sound white oak acorn in January or February, plant in rich earth in a flower-pot, keep it in a warm place and well watered. In the spring, the little oak will make its appearance, and will require no care, except watering, and will withstand the winter if not too exposed to hard freezes. If the tap root is cut off in the early part of the next spring, it will continue to grow and put out new limbs, but will not get much taller, and by cutting back the central roots that will spring from the base of the tap root every spring, a few years will produce a diminutive little oak, a fac-simile, in appearance, to the lord of the hard woods. Some enthusiastic lovers of nature make veritable pets of these dwarf oaks.—*Southern Lumberman.*

WILLIAM T. BLUNT, C. E., representing the Dunham House Drainage Company, of New York, has opened an office at 413 Montgomery Street. He extends an invitation to all interested to call at above address and examine a full-size model. He gives personal supervision of all work. The pipe used in this system of drainage is all wrought iron, with screw joints and special cast-iron fitting. The whole is asphalted inside and out, presenting a smooth inner surface without depression. Send for illustrated pamphlet.

ARCHITECTURAL STUDIES, Part IV.
SEASIDE AND SOUTHERN HOUSES,
By F. A. WRIGHT, Architect.

Contains twelve plates of designs, 11x14 inches, for cheaply built houses, with ample veranda room suitable for a warm climate or summer use. With one or two exceptions, these houses will not much exceed $2,000. Cost, however, will vary in different localities, according to the price of material and labor.

Price, $1; sent by mail free of postage to any part of the world. W. S. COMSTOCK, Publisher. Can be ordered through this office at same rates.

COTTAGE PORTFOLIO,
CONSISTING OF 12 FINELY LITHOGRAPHIC PLATES,

Containing 12 Designs of Low Cost Houses, with 43 Illustrations and Explanations. By D. S. HOPKINS, Architect.

Published by FRED. A. HODGSON, New York. PRICE, $1.00.

MIND IN NATURE.
A POPULAR JOURNAL OF PSYCHICAL, MEDICAL, AND SCIENTIFIC INFORMATION.

Published monthly by the COSMIC PUBLISHING COMPANY, J. E. WOODHEAD, Manager, 171 West Washington St., Chicago, Ill.

Contains much valuable matter from the pens of a long list of D. D.'s, M. D.'s, and LL.D.'s of national reputation. The bound volume before us contains 112 pages, 7x10½ inches, in which there is a fund of ideas and matter that cannot fail to interest minds seeking truth and advanced thought reduced to printed pages.

THE AMERICAN BUILDER,
A WEEKLY JOURNAL IN THE BUILDING INTEREST,

Published at Cleveland, O., by the AMERICAN BUILDER CO.,

Is a new candidate for patronage among architects and builders. Subscription price, $2 per annum. F. HOUGHTON, Managing Editor.

Its first numbers are neatly printed, and the assurance held out that improvements will be made in rapid succession with the increase of patronage.

Building and Improvements for Woodland and Yolo County for the First Quarter of 1886.

EDITOR OF THE CALIFORNIA ARCHITECT: Owing to frequent storms and continued bad weather, the building interest has experienced a set-back, and but few engagements of importance have been set in operation. Nevertheless, public feeling is buoyant, and good hopes are entertained for the coming of spring and pleasant weather to usher in the usual amount of activity.

Material men and solid mechanics of all branches are sanguine as to the ultimate result of the future, although we can hardly expect the amount of last year to be duplicated. The opinion of those competent to judge says the advance in lumber will materially retard building in this vicinity during the season.

The following record presents the amount and number of engagements for January, February, and March:—

City, 25 frame buildings; value	$28,800
1 brick building	2,000
15 improvements	6,200
Total, 41 buildings and improvements; value	$37,000
County, 10 frame buildings; value	$23,000
1 brick building	5,000
Total, 11 buildings; value	$28,000
Total for city and county, 52 buildings; total value	$65,000

Total aggregate for corresponding three months of 1885, 44 buildings; value of same, $102,500. Increase in buildings, 8; decrease in capital, $37,500.

Yours truly,
GILBERT & SON.

Woodland, March 30, 1886.

Hayes, cor. Broderick. Two-story frame.
O.—John Glover.
A.—H. Geilfuss.
C.—Theo Von Borstel.
$3,000.

Howard, cor. Lafayette. Two-story frame.
O.—W. Alfs.
C.—H. J. Weiss.
$4,500.

Haight, bet. Octavia and Laguna. Two-story frame.
O.—W. Felter.
A.—J. Gash.
C.—T. Worden.
$7,500.

Haight, cor. Devisadero. Two-story frame.
O.—T. W. Bogart.
A.—E. R. Swain.
C.—J. Campbell.
$6,000.

Haight, nr. Stanyan. Two-story frame hotel.
O.—Mrs. Lewis.
C.—W. F. Lewis.
$3,000.

Haight, nr. Stanyan. Additions.
O.—C. Damon.
Day work.
$1,500.

Hyde, bet. Clay and Washington. Three-story frame.
O.—R. C. Hooker.
A.—Clinton Day.
C.—Ingerson & Gore.
$8,000.

Howard, bet. Fifth and Sixth. Additions.
O.—C. Ruppel.
C.—W. Jarman.
$600.

Haight, bet. Steiner and Pierce. Two-story and basement frame.
O.—J. Livingston.
A.—W. Moosier.
C.—P. Laherty.
$5,600.

I

Ivy Avenue, nr. Van Ness. Two two-story frames, four flats.
O.—Mme. Sorbbeir.
C.—J. Dutton.
$2,500.

J

Juniper, nr. Bryant. One-story frame.
O. and B.—H. Münster.
Day work.
$1,000.

Jones, nr. Filbert. Two two-story frames, four flats.
O. and B.—G. Knopf.
Day work.
$6,000.

Jones, cor. Valparaiso. Two-story frame.
O.—Miller & Knopf.
A.—Geo. E. Voelkel.
C.—Gott Knopf.
$6,500.

L

Larkin Avenue, bet. Ellis and O'Farrell and Hyde and Larkin. Three-story frame.
O.—J. Frank & B. Morrbrink.
A.—M. J. Welch.
C.—J. Klein.
$2,700.

Lafayette, bet. Mission and Natoma. Two-story frame, four flats.
O.—Sarah Falk.
C.—Doyle & Son.
$3,000.

M

Mission, bet. Fifteenth and Sixteenth. Three-story frame.
O.—F. Straub.
A.—W. Schrof.
C.—W. A. Knowles.
$5,050.

MISTAKES IN BUILDING 78

Material Facts for Owners' Consideration.

GOOD buildings are sometimes erected without the professional services of an architect. But whether as good and as complete as they would have been under the planning and superintendence of a competent architect, is a question. The proposition suggested is reasonable. For the incessant and perpetual study of an architect is to discover and develop new ideas, to determine and mature better plans, to overcome difficulties encountered in prior experiences, to provide against defects and errors which may have occurred, and in a word concentrate the entire energies of his mind and brain to producing improved results; and it is not reasonable to suppose that among men of equal intelligence, education, judgment, industry, and advantages, those who devote their time, and employ their mental and physical energies in special pursuits, can properly understand and practice their selected avocation, and, by incidental application, also understand as proficiently those specialties which others, their equals in all intellectual and physical senses, have made matters of constant study and daily application. Men generally master not more than one thing or calling, and as the "old saw" goes, "They that are jacks at all trades master none." We admit that there are a host of contractors who would have become most excellent architects had they so applied themselves. But a reasonably perfected knowledge of architecture can only be obtained by the possession of the natural qualifications of mind and judgment, and constant practice and study. Incidental scholastic and superficial knowledge does not, by any means, qualify men to assume the practice of a profession, than which no other requires the more intense exercise of every mental and intellectual faculty. Hence, we find men calling themselves architects who are simply pretenders, mere frauds, aspiring to be what they can never become, through fatal defects in their natural or acquired qualifications. But mistakes sometimes occur even with the best and most careful architects, and generally when no architect is employed, and most always when buildings are ntrusted to the manipulations and control of parties whose presumption is only equaled by their fearful lack of judgment, and complete ignorance of every correct principle of architecture.

Building Movements.

BUT little of more than ordinary interest has developed during the past month in building circles. Yet our monthly report presents a more favorable showing than has either of the preceding months of the present year. Our January report showed a gain over the same month for '85 in the sum of $45,535, which was followed by a falling off in February and March of $608,218. But May furnishes returns in building facts which places it $320,781 ahead of May of previous year, and so far recovers the lost ground of the two prior months.

The architects' offices generally in this city have been, and are well filled with engagements, so much so that we have not been able to find competent draughtsmen to fill the many orders sent to this office for help. The offices in San Francisco are well supplied, with but occasional applications for draughtsmen, and then always for *first-class, competent men*. From other parts of the State orders have been received, but in every instance with, "send us a good man," thus indicating that the tendencies are such that it requires the best of architectural and draughtman skill to meet the demands of clients. But the supply has not been, and is not at present equal to the demand.

The prices of building materials and labor remains in favor of owners, and the fierceness of competition—if the recklessness illustrated by the figuring done by some contractors is worthy to be so denominated—removes all liability of contracts being let for more than a fair value on the transaction; and as often as otherwise the contract amount falls short of paying one hundred cents on the dollar at completion. So that, as a rule, gains and advantages are mainly with owners.

Some of the amounts given in our building intelligence list are but partial. Those on the Nightingale building, of $8,926, and on the Davis Bros.' building, of $34,185, being sums in addition to partial statements heretofore made on the same structures. The $249,500 on J. C. Flood's building includes only the carpenter work, $102,000; cast-iron work, $49,000; wrought-iron work, $45,000; grading, $5,500; and brickwork, $48,000. There are several contracts yet to be let. The summary for the month shows:

119 frame buildings	value,	$496,126
4 brick "	"	312,870
18 alterations and additions	"	78,050
141 Total for current month		$887,046
CORRESPONDING MONTH OF 1885.		
147 engagements	total value,	$566,265
Gain in May, 1886, over same, 1885		$320,781

THE exigency of getting a living, and this is especially true in large towns and cities, compels many children to begin work when they ought to be at school. This is unpleasant, but it is nevertheless a fact. As labor makes the wealth which pays taxes, it is no more than an act of justice that children thus compelled by circumstances to work through the day should be provided with facilities for pursuing in the evenings the studies they have dropped. To this end evening schools, including those equal in every respect to the "high schools," now a part of the school system of most towns and cities, should be established. This would enable many an ambitious young man to do with greater dispatch and less labor what he will probably do anyway, viz., acquire a fair education of the kind attained in schools. In these times the need of education is pressing, and every facility for its acquirement should be provided. As previously intimated, a young man of the right quality is likely to learn anyway, but as the labor of those who are obliged to work in years when they ought to be at school goes to enrich the community, they have a right to demand that the way be smoothed for them. —*American Machinist.*

THE State Department at Washington has issued a pamphlet belonging to its series of U. S. Consular Reports, entitled "Scouring of Wool in Belgium, Great Britain, and Germany." The pamphlet illustrates three machines used in Belgium for this purpose.

Bay Windows over Street Lines.

SAN FRANCISCO has been, and not inappropriately, styled the city of bay windows. Within the past twenty years or more, but very few—safe to say not more than two and one-half per cent—of all dwelling and tenement houses erected within the county limits, other than those in the erection of which the closest economies have been practiced, that one or more bay windows have not been added. When attached to buildings sitting back from the street lines, the number and sizes are always regulated by the pleasure or caprice of the owner or architect. But when projecting over the lines of streets, the sizes are supposed to be regulated by the "fire limit laws," which prescribe both width or spread, and projection beyond the face of the walls.

Until recently, the limitations as to sizes have been a source of annoyance and vexation to both architects and the fire warden's department of the city government. The limit of spread across the front has heretofore been entirely too restricted and arbitrary in all cases; so that an architect in preparing plans was allowed no greater privilege in proportions in a frontage of twenty-five feet, than he would be entitled to apply in one of eighteen feet, with the restricted width of eight feet no greater than would be proper for the eighteen feet front. Consequently, buildings of greater cost, size, and pretensions were denied the proportionate necessary increase of spread.

CORNER BAY WINDOWS,

Until the recent amendment, were also prohibited by the ordinance. But the ordinance being so framed that parties with *sufficient influence* might, and often have danced through its loose meshes by securing permits of privilege *not common* to all, except through channels not understood by some, who recognize ordinances passed by the proper authorities as *general and conclusive* alike upon all. Hence the iniquitous *special permit* practice worked injustice; for even if two parties applied for like privileges, the one being in good favor or possessing the necessary influence outside the true merits of the case, and the other having in some way rendered himself obnoxious, or gained disfavor in certain directions, the one might, and in cases has been denied privileges granted to the other. This sort of thing has been done in this city in many cases of "special permits," other than bay windows.

THE ORDINANCE AMENDED.

The universal objection to the restrictions enforced by the original ordinance, and the numerous conflicts encountered by the guardians of the law in the matter of bay windows—architects and builders generally disregarding the limits prescribed, and exercising their individual judgments in the matter—the amendments following have been passed by the Board of Supervisors, and are the law in the case until changed by subsequent municipal legislation.

ORDER No. ——Amendatory of Sections 27, 36 and 38 of Order No. 1,752, to define the Fire Limits of the City and County of San Francisco and making regulations concerning the erection and use of buildings in said City and County.

The People of the City and County of San Francisco do ordain as follows:—

SECTION 1. Section 27 of Order 1,752 is hereby amended so as to read as follows:—

[Bay or Oriel Windows—Swell Fronts.]

SECTION 27. No person shall build a bay or oriel window which shall project over the line of any street more than three feet, or more than nine feet in width, nor shall the bottom of said bay or oriel window be less than thirteen (13) feet from the sidewalk. No bay or oriel window shall be constructed upon any street, lane, alley or place which is less than thirty-five feet in width. No swell front shall be erected unless the walls are entirely of fire-proof materials, and no bay or oriel window shall project from any swell front. Bay or oriel windows constructed in frame buildings shall have piers or spaces of not less than five feet in width between them. Bay or oriel windows constructed in brick buildings shall, for a two-story building, have piers of not less than six feet in width between them, and for a four-story building, the piers separating said windows shall not be less than eight feet in width; and no bay or oriel window shall be more than four stories in height above the sidewalk. No bay or oriel window shall be erected on the corner of any brick building. The joists of bay windows in brick buildings shall be supported on lintels of iron at each story, said lintels to be the full width of the wall and rest eight inches on each jamb, and the top of the openings shall be covered with a brick or stone arch. The exterior framework of such bay or oriel windows constructed in brick buildings shall be covered with fire-proof material.

SECTION 2. Section 36 of Order 1,752 is hereby amended so as to read as follows:—

[Scuttles and Skylights in Roofs.]

SECTION 36. All store buildings over one-story in height in the City and County of San Francisco, whether already erected or hereafter to be built, shall have scuttle frames and covers or bulkheads and doors made of or covered with some fire-proof material; and all scuttles shall have ladders leading to the same; and all such scuttles or bulkheads shall be kept so as to be ready for use at all times, and all scuttles shall not be less in size than two (2) feet by three (3) feet; and if a bulk head is used or substituted in any building in place of a scuttle it shall have stairs with a sufficient guard or handrail leading to the roof. The door in the bulkhead or any scuttle, shall at no time be locked, but may be fastened on the inside by movable bolts or hooks.

All skylights of buildings outside of the fire limits where placed less than three feet in height above the roof shall be enclosed with a substantial railing not less than three feet in height. Within the fire limits all skylights exceeding twenty superficial feet shall have the frame and the sash formed with iron, and if not glazed with glass, three-sixteenths of an inch in thickness, shall be covered with protecting screens of No. 10 (or heavier) wire with meshes of not more than one and a half inches, said screens to be secured to the iron frames at least three inches from the glass.

SECTION 3. Section 38 of Order 1,752 is hereby amended to read as follows:—

[Removal of Dangerous Walls, Buildings, Chimneys, Smokestacks or Other Appurtenances to a Building, Sheds or Fences.]

SECTION 38. Whenever, in the judgment of the Board of Fire Wardens, any building, wall, chimney or smokestack, or other appurtenance to a building, shall, from any cause whatever, be in a situation to be dangerous to persons or property; or when any wooden building within the fire limits shall, in the judgment of the said Board, be damaged by fire or decay to the extent of forty (40) per cent of its actual value, to be estimated above the line of sidewalk in front of said building, the Board of Fire Wardens shall immediately give notice to the owner or owners of such building, wall, chimney or smokestack, or other appurtenances to a building, sheds or fences, or to his, her or their agent, or the person having the control thereof, if the owner cannot be found, to remove the same forthwith; and the person receiving such notice shall, within forty-eight hours after receiving the same, comply with the requirement thereof. In the event of a dispute as to the amount of damage caused by fire between the owner and the Board of Fire Wardens, said dispute shall be determined by arbitration of competent mechanics, the owner to select one arbitrator, the Board of Fire Wardens the other; and in case that the arbitrators so chosen cannot agree, they shall select a third, and the decision of the majority shall be final and conclusive—all expenses of the arbitration to be paid by the owner.

Heretofore, corner bay windows have not been allowed, and still are forbidden in the erection of brick buildings. But Section 27 as amended, omits frame buildings from this restriction. Consequently, those who desire them, can erect corner bay windows at the intersection of any two streets, over the sidewalk, where the distance from the sidewalk to soffit of the bay is not less than 14 feet.

A Queer Suit against an Architect.

THE story runs thus: Some year or more ago, a lady called on Mr. T. J. Welsh, architect, and entered into an arrangement for plans, specifications, etc., for two buildings, to cost $10,000. The agreement for compensation was fixed at five per cent for full professional services, and two and one half per cent should the buildings not be erected. They were not, and the architect allowed his claim to remain unsettled until—to save an "out-law"—suit was commenced in a justice's court for the sum of $250, being the agreed sum for plans, specifications, etc. Rather than meet the case in court, the lady, by her attorney, proposed a compromise, and the claim was settled for $150, and receipt in full passed. No demand at the time of settlement was made by the client for possession of the plans, etc., but a few days afterward, the architect was asked to surrender possession of the papers. This he refused to do upon the ground that all plans, drawings, and specifications were the property of the architect producing the same, and that the client had no right to their possession, beyond the uses to be made of them in case the work went on.

The lady client not being satisfied with this, upon advice of her attorney, commenced an action against the architect to recover the plans, etc., and also the money paid him, claiming that he had not performed his contract with her. The case occupied about a full day of the time of the court, and the testimony adduced by the architect proving conclusively, that by the rules of architectural practice in this State, and generally throughout the United States and in Europe, the plans and specifications made by an architect are his, and not the client's possessory property, beyond the uses for which they are intended to be applied in the progress of the work proposed to be done under them. Judgment was rendered in favor of the defendant.

This decision, as far as it goes, establishes the rights of architects and owners in reference to the ownership and possession of plans, etc., even if paid for by the client. An architect is not supposed to sell his plans, drawings, and specifications, but simply to embody and delineate on paper his own and his client's thoughts and ideas, shaping and utilizing them to best advantage; and the compensation received for services goes no further than payment for his professional knowledge and skill in producing the desired results, to be exemplified in actual construction in case the work goes on.

This may appear to some as a hardship upon owners, but it has another bearing of great importance to architects, who, as a rule, suffer injustice every time they part possession with plans, etc., worked out by them, as thereby they lose control over the results of their studies, and make it possible for others to reap the benefits which should be enjoyed by the men who conceive and shape the form of thought, and mechanical and professional ideas which might never have been conceived by others in the same form. It is simply retaining possession of the thing legitimately owned.

Great Influx of Strangers.

AS the result of the railroad war and low fares, very many thousands of people, representing nearly every section of the United States, have "come to see California" generally, and San Francisco in particular; some from motives of pleasure and curiosity; others uniting with these, business objects and interests, and possible permanent abiding in this State or city; and a large number of working people inspired by the hope that the demand for labor upon this coast would be such as to give employment to all wage-earners who might avail themselves of the unprecedented opportunities afforded by the railroad people of crossing the Continent "for a song." Of the latter,—those who have come to California with no other expectation or purpose than to find work as journeymen mechanics, artisans, or laborers,—a very large proportion must meet disappointment; as

the labor market was well supplied before the commencement of the great rush of visitors or immigrants which has within a few weeks added so many thousands to the number of strangers "within our gates."

The people of California would only too gladly welcome that condition of things which would give employment to tens of thousands of the hardy sons of toil, other than those whose homes for years have been in this city and State; but with no new special developments in business enterprise, nor any unfolding in any direction demanding an increase of skilled or unskilled labor, over and above the resident supply, it is impossible that more than a limited number of the more persevering and diligent seekers should find employment.

New discoveries, requiring large forces to operate them, or offering inducements to those willing to risk the uncertainties of fortune in pursuit of prospective results; the expansion of great interests and improvements demanding a large amount of manual labor, and the employment of thousands of working people to prosecute them, present inducements and justify the concentration, and gathering together at available points of a sufficient number of men to meet and supply the demand. But a rush of people to a given center, where none of these exigencies exist, and all the conditions are normal, with supply fully equal to demand, disappointment must result to some.

A CHANCE FOR EARNEST MEN.

Although what we have written expresses the general condition of things in California, as far as any considerable number of wage-earners recently arrived are concerned, there are nevertheless, reasonably well sustained good prospects for a goodly number if *really competent and qualified men* to find employment. This of course will depend largely upon the earnestness with which each in his respective calling shall seek to secure an engagement. The chances for the competent and skillful men are fair, but those who are not will find it difficult to obtain more than incidental opportunities to labor as per diem workmen.

This however may be added—that the element of versatility and progressiveness abounds in California, and there are doubtless very many as yet undeveloped means, methods and channels of business successes and enterprises possible of introduction in this State; so that those who may fail in the realization of their first conceived purposes, may, by the exercise and practical application of that genius so universally accorded to the descendants of the Pilgrim Fathers, lead to results of—at present, unthought of magnitude. Necessity is said to be the mother of invention, and it is to be hoped that many who have come, not finding openings ready made for them, nor grooves run, into which without effort they may settle, will go to work and make openings and plow new grooves in which to operate, alike with profit to themselves and benefit to the general interest. The resources of California are by no means exhausted, but remain awaiting further developments which, we hope, will, in many directions, be stimulated by the massing of so many new people on this coast at the present time.

The Growth of San Francisco.

VIEWED from the early days—the time when the briny ocean tides ebbed and flowed over nearly every foot of that portion of the city now occupied by substantial brick buildings in which the great bulk of importing and mercantile business

is at present transacted; the days when steam-ships of three, four, and five thousand tons lay at anchor, or securely moored to piers and wharves, three and four blocks in-shore-ward from the present eastern bulkhead or water front; when the block upon which the present post-office and appraisers' building was so deep in mud and tide water that the bottom could not be reached by the longest pile possible of being driven for foundation purposes; when the entire site of the city was subdivided into valleys, by high hills of natural formation, or ridges of sand ground, and thrown up by the ocean upon the western shore of the peninsula, and by the winds driven across land and piled up in sand hills and dunes, to altitudes towering above the tallest buildings,—San Francisco rightly stands as a marvel of energy and enterprise.

The amount of money expended in cutting and filling to produce the present contour of the city's surface, would be sufficient to purchase the land out and out, and to erect substantial buildings for a city of twenty-five thousand inhabitants in any other new and promising section of country.

The present and prospective greatest business street of the city, Market Street, as late as 1858, was, west of Third Street, a continuous sand hill diverging northerly after passing Fourth Street, thereby forming "St. Ann's Valley," including the site of the present Baldwin Hotel and Theater, with the location of which California tourists generally are familiar.

Golden Gate Park, now ranking well, and destined in time to be second to but few in the United States as a public park, was, but a few years ago, a barren, desolate waste, covered with sand drifts and dunes, and stunted growths, seemingly ashamed to claim membership in the tree family.

But with all these drawbacks and disadvantages, the city now spreads itself over many square miles of territory, and the expansion still continues; while the vacant places within the older limits are being filled up with permanent structures, many of them being in pretensions and cost, "good enough" for the better parts of the metropolis of the United States.

From time to time there existed the spirit of complaining and business grumblings that things were not better, and money making less easy than in the early days of California's existence. Still the car of progression has rolled on and is still advancing, and even many of those who have complained most, have become rich or well to do. And taking in the entire situation, it is reasonable and altogether likely, that within a generation from the present time, San Francisco will spread to fully twice its present size, and double, if not triple its present number of inhabitants.

As far as its building improvements are concerned, about one-tenth of the city is included within the fire limits, within which brick, stone, iron or other indestructible material alone is permitted in the erection of buildings. But beyond these limits, wood is used exclusively, except for business structures. The most costly residences are, with a single exception, wood constructions, including the private residence of Senator Leland Stanford; that of the late Mark Hopkins, costing about $1,000,000; the residence of Chas. Crocker; Senator Herst; Porter Ash; and many others of the millionaire class.

J. C. FLOOD, BANKER,

Being the only notable exception; his city residence now in course of completion being of imported stone, brick, etc. No small amount of reflection has been cast upon Mr. Flood, in view of the fact that his great fortune has been drawn mainly *from the pockets of the people of this city and coast*, and the universal sentiment is that it would have been but a small act of justice on his part to have confined his expenditures to and among those, and the community in and from whom and which he has gathered his great fortune.

The street and section of the city where the Stanford, Hopkins, Crocker, Flood, and other mansion residences stand, was, as late as 1860 or later, a rough, ungraded hill-top, covered with sand and shrubbery, and by no means desirable, being over 300 feet altitude above tide level, and adjudged unsuitable for practical life, owing to the difficulty of assent. But the grand view afforded from this elevation, taking in the whole scope of country over land and water, from all parts of the compas, was indescribably inviting and fascinating, and by degrees the tax upon limbs and muscle to make the ascent, yielded to the magnificence of the prospect when home was reached.

THE CABLE-STREET RAILROADS.

When this device as a street-car motor became a certainty, a demonstrated fact, hills no longer bore a forbidding aspect. When it was made sure that the ascents up steep grade could be made with the same ease and personal comfort, and a great deal more of scenic and romantic luxury than on level roads, the hill-tops so far as traversed by the new mode of travel, soon gained favor, and advanced in value more than double within a single year.

These cable roads have not only helped and improved hill property, but in every direction where they are operated, prop-

erty has advanced in value, and thousands of people of moderate means have been enabled to secure comfortable homes with ample grounds, long distances from business centers, yet rendered practically not far away by the splendid means provided in almost all directions, of traveling by cable road at the rates of five to eight miles per hour, at a cost of five cents for a distance of three or four miles—more or less.

LOOK WELL AHEAD.

With all that has been accomplished, with all that is, and with all that appears in the future, it must be conceded that great things have been achieved in San Francisco; that with all the vices, immoralities and cosmopolitanism permitted within her borders; with all that might have, but has not been done for her greater improvement and prosperity, she presents a record in fact unequaled by but few cities in the Union.

Science of Architecture.

[Special for this Journal. By F. HILLERT, Architect and Mechanical Engineer.]

(Continued.)

TO make a reliable scale, and to measure the same temperature felt everywhere alike, two cardinal points are selected and fixed, depending on the invariability of the freezing and evaporating point of the water; those points carefully fixed, then the space obtained by expansion, being divided in respectively 100 parts for Celsius and 80 parts for Reaumur, called the positive or + degrees of temperature, negative or – degrees below the solidification of water, used for the measurement of cold temperature. On the continent of Europe these scales are most in use, for all days and scientific purposes; for the last are the most convenient and best adapted. We here and in England use Fahrenheit scale. The zero point is the freezing point of quicksilver; 32 degrees of the same correspond to the zero point of the other scales, and the temperature of the boiling water at respectively 80° and 100° corresponds to 220° of Fahrenheit. Are Fahr., R., and C., the respective scales above named, then are, comparatively, Fahr. $= 32 + \frac{9}{5}$C. $= 32 + \frac{9}{4}$R.; C. $= \frac{5}{9}$(Fahr. $- 32) = \frac{5}{4}$R. R. $= \frac{4}{9}$(Fahr. $- 32) = \frac{4}{5}$ C.

Metallic thermometers are used for the measuring of temperature, and the action of them depends on the different expansive capacity of the different metals to be used. When two or more strips of different metals of different expansive tendency are fastened together, the action of heat will bend them; caused by the different expansion of the metals joined, giving hereby means to ascertain the temperature existing. They are used for measuring high temperatures up to 900° Celsius, when quicksilver thermometers cease to be reliable.

The term "absolute heat" is used to scale the expansive capacity of gases, and begins with 273° below zero of the centidegree scale. It is the point where the expansive capacity of the air form bodies ceases. (Is it the freezing point of air?)

The absolute temperature for 20 centidegrees is equal to $273 + 20 = 293°$ absolute.

The metric system retained, is adopted by Federal law, besides our scales in use. It originated during the French first Revolution, and was intended for general adoption. The spirit of the social French Revolution was extended and made serviceable to science. It was acknowledged as necessary to change the old system of weight and measure, and substitute for it a natural unit of measure, *i. e.*, one existing in nature, which, when lost, could be found, and used again. The leading French savants, Borda, Lagrange, Laplace, Monge, and Condorcet, used the proposition as means for the measurement of a European geographical degree, to recommend the establishment of a universal unit of measure, which was found to be an aliquot part of the earth's meridian. After the completion of extensive labors by a commission, was, on the 9 frimaire VIII. (29 Nobr. 1800) as result of this measurement, the 10,000,000 of a meridian quadrant—443,296 old Parisian lines as the true and definite meter—proclaimed and adopted. In the meantime it has been acknowledged, and the impossibility to find a natural measure, to which the experiment with a pendulum, swinging seconds, has considerably added. The metric system has been established in France, Belgium, the Nederlands, Italy, Portugal, Greece, and Roumania and made obligatory in Germany and Austria. The change requires extensive labors to change measures, formulas, and calculations to the metric system, of which nations shrink, having not the taste and time for scientific progress.

1 meter	is equal to		3.23 feet
1 square meter	is equal to		10.76 square feet
1 cubic	"	"	35.31 cubic feet
1 foot	"	"	1.305 meter
1 square foot	"	"	0.092 square meter
1 cubic foot	"	"	0.028 cubic meter
1 inch	"	"	2.54 centimeter
1 square inch	"	"	6.45 square centimeter
1 cubic inch	"	"	16.38 cubic centimeter

To measure the velocity of the air, anemometers are used. The instruments in practice, therefore, are Rotatory Anemometers, consisting of a very small, light-winged wheel, made of aluminum, and being propelled by the pressure of the air. An indicator, attached to the spindle of the wheel, furnishes the number of revolutions made in a certain time, from which the velocity of the air, with the aid of a constant, found for each instrument separately, can be obtained.

The common Rotatory anemometers are used to find the mean average velocity, but do not give any variations in the velocity of the current during the operation; if not, special arrangement (not frequently found) of the electric and acoustic kind, are attached. These apparatus are best fit for longer periods of observation. By them can only be found the mean quantity of air passing through a channel of a certain section during a certain period of time, *i. e.*, one hour under given conditions; for example: for the examination of the effect of a ventilation arrangement for the contracted and guaranteed quantity of air to be furnished.

Since the velocity of the air in the different places of the channels in general will not be the same; since, farther, by the introduction of the anemometer in the channel a small decrease in the same and a consequent deviation in the direction of the current is made; also the constant of the instrument to be reliable after a certain time, must be found anew and from other causes, those measurements of velocity can only give approximate results, with which we must be satisfied, since means are wanting and have not been found up to this time for a complete and correct measurement of the velocity of the air.

Another kind of anemometer is the statistic, *i. e.*, those which give the momentary velocity of the air, to be seen direct on a scale. They are best suitable for a controlling apparatus, and for the correct working of the ventilation system.

The above described instruments are only fit to measure the velocity of the air when the same is neither too hot nor too much soiled, and are unfit to measure the draft in a chimney, or heating arrangement. Other instruments are therefore constructed. To regulate the current of air in the channels, throttle valves, slide valves are used.

To measure the degree of moisture contained in the air, hygrometers are used. These instruments have not the purpose to give the value of the moisture, but only the proportion between the moisture contained in the air at present to that contained in it of the same temperature, when the same would be in a saturated condition. This ratio is designated "the relative moisture."

The point of saturation (thaw point) is different with the different temperatures, and the following table furnishes the quantity of moisture contained in 1 cubic meter of air at the state of saturation.

– 20	°C	1.06	gr water	+ 15	°C	12.81	gr. water	+ 60	°C	129.80	gr. water
– 15	"	1.39	"	+ 20	"	17.23	"	+ 70	"	177.41	"
– 10	"	2.39	"	+ 25	"	22.95	"	+ 80	"	290.88	"
– 5	"	3.36	"	+ 30	"	30.23	"	+ 90	"	420.52	"
+ 0	"	4.89	"	+ 35	"	39.51	"	+ 100	"	591.92	"
+ 5	"	6.81	"	+ 40	"	50.95	"	+ 112	"	860.	"
+ 10	"	9.38	"	+ 50	"	82.72	"	+ 120	"	1,120.	"

According to the present state of investigation, a degree of saturation of the air of from 40 to 60 per cent is the most favorable for the human health.

There are two different kinds of hygrometers. The first kind is based thereon, to decide for the moisture presently contained in the air, the temperature of the thaw point, and from the same under assistance of the actual existing temperature of the air to find the percentage of saturation; the second kind of instrument uses the changes of a delicate hydroscopic body produced and conditioned by the moisture of the air for the direct finding of the percentage of saturation. The last kind of hygrometer is for use the most recommendable, and are those of Saussure, and others. The first kind are those of Daniell, August, and Regnault.

Apparatus for moistening the air. With air heating the moistening is mostly done by placing open vessels filled with water in the heating chamber. The filling of the pans (arranged for a variable water surface) and the control over the same must be done from outside of the heating chamber.

This method of moistening the air is incomplete. An improvement can be made when the water pans are so arranged that the air warmed by the heater is compelled to pass over the surface of the water. For this purpose the heating chambers in a certain height are divided into two compartments, in one of them water pans are placed (arranged with overflows), one on top of the other, with spaces between them, compelling the heated air to pass over the water surfaces. The effect of moistening is certainly increased with the increase of water surfaces. Approximately can be taken, for each square meter of the channel, 15 square meters of water surface.

A self-regulating apparatus may be constructed which will fulfill the condition that when a certain desired state of moisture is passed, the apparatus will discharge, self-acting, the wanted quantity of water. A hygrometer of a separate construction closes an electric current, which opens a valve by means of an electric magnet, discharging steam or water spray so long, until the desired degree of moisture is regained, when the interruption of the electric current will close the valve and stop the flow.

The reason of writing the above was a displeasure felt by the passing and enforcement of certain municipal laws—and other matters—which are and were erroneous, having no basis. They created displeasure in society and do not give the comfort and protection which a beneficial law should. Once begun, one subject leads to another on the same scientific matter; it is inexhaustible, and may be proceeded with by abler men.

Practice was the forerunner and the foundation of the sciences in the course of progress of human culture. The fire made by friction by the primitive man, to prepare his food and to warm himself when cold, compared with the making of steam for preparing all raw material by mechanical process for the protection and comfort of men; and with chemical process by decomposition, etc., for explosives and thousands of other things, is only a slight illustration.

There has been a cry by practical men against theory, when hardly anything can be and is done by them without using the intellect, either direct or indirect. The men, for instance, attending to a shaping machine; the Chinamen, attending to the loom, work under and use the spirit and genius the inventor placed in the machine, requiring of him only the mechanical labor as attendant. They do not wish to acquire, and have not the scientific knowledge; hence criticise and condemn what they do not understand-fully as the skillful stair builder, the many practical details of construction, gained and made perfect by daily and incessant application; or the science of obtaining the numerous intricate lines, cuts, bevels etc., involved in stair-building; but he should understand most perfectly every requirement necessary to produce stairs that will afford the greatest amount of comfort to those who may use them.

"Hard" and "Easy" Stairs.

THERE is no feature in house and building construction which should be more carefully considered, or receive greater attention from architects, than the stair work; as the stairs are a part and portion of the edifice used by every one, young and old, in passing from story to story, and a sense of fatigue or comparative comfort follows each successive assent.

The architect may not, and is not supposed to understand as

Stair builders are never to blame for "hard" or uncomfortable stairs, *when controlled by plans made by another.* Whether "hard" or "easy" depends altogether upon the allotment of space for construction. The limitation of horizontal distance for run, to vertical height from floor to floor for rise, at once determines results; for if the run is made less than it should be, as compared to the height or rise, no amount of money that might be expended, nor the skill of a thousand stair builders, could pos-

sibly prevent the curtailment of comfort resultant from the lack of sufficient horizontal space.

The rise, height from floor to floor, is absolutely arbitrary, admitting of no concession or compromise; and upon this fixed factor, all other calculations in stair building must be based; so that ease and comfort, or hardship and fatigue, depend wholly upon the proper accommodation of run to rise. Hence, if the architect restricts the space within which the stairs are to be built, to less than what is necessary for the purpose, he thereby establishes an insurmountable obstacle to *easy*-stair construction; and in every case where the ascent of a flight of stairs is not comparatively comfortable, the responsibility rests upon the party designing and planning the same, whether stair builder or architect—if an architect is engaged, and his plans limit the space of run and rise for the stairs, he alone is responsible for the results. No stair builder, however skillful he may be, can possibly make easy stairs where the horizontal and vertical distances are not proportionately correct.

PROMOTERS OF AILMENTS AND DISEASE.

The importance and materiality of the subject-matter under notice is much greater than most people suppose. "These stairs do tire me so;" "It puts me all out of breath to go up these stairs," etc., are perpetual and incessant expressions, particularly with the feeble and aged; and frequently smart and active people find themselves well out of breath by going up-stairs a little lively; all of which goes to set up the fact that a vast amount of physical force and energy is required and expended in the ordinary use of stairs—millions of people the world over, being every moment of time in the act of ascending or descending these indispensable house conveniences. And the fact is well known, especially among the medical fraternity, that "climbing stairs" is a most injurious exercise to weakly and ailing persons—those not blessed with strong physical frames and sound lungs. The doctor's prohibit is placed upon multitudes, and untold numbers of prostrations upon beds of suffering have origin in too much stair exercise. And this being true, that ascending stairs is hurtful to those who are not strong, is it not an extra tax upon the strength and energies of every man and woman who is required or compelled to pass from floor to floor by means of stairs? It is more tiresome to even the strongest and stoutest of men to ascend stairs to the height of fifty feet, than to walk on level ground twenty times that distance. Although a man might, and very possibly could, "walk all day" without exhaustion, it is doubtful whether a human being could be found, capable of enduring the fatigue of one single hour's continuous ascent of stairs, particularly of those denominated "hard" to ascend. The strain upon the muscular and physical forces would be far too great for human endurance. It is questionable whether in the entire population of San Francisco a single individual exists who would be able to perform the feat, and if found, the condition at the ending of the performance would be

EXCEEDINGLY DILAPIDATED.

All this serves to verify the common every-day experiences and aversions in families and among business men and people generally to the use of stairs. The ever-present disinclination in this regard remains unexpressed from the force of circumstances, —the compulsory ascent of stairs as the only means of reaching the upper stories. People do not "go up-stairs" for any pleasure found *in the act* of going up. There may be pleasures reached through and by the act, but not *in* its performance. And it is safe to say that if necessity, curiosity, or some other special incentive never existed, rendering the use of stairs more or less compulsory, they would remain unused.

Stair building is one of the necessities created by the huddling together of communities of people, in cities, towns, and villages within limits which require structures of more than one story in height, to furnish appartments sufficient for the purposes of business and domestic life. When mankind dwelt in tents, and spread their dwelling-places over large tracts of land, the stair builder was unknown. But the centralizing and contracting effect of civilizing brought about the necessity for buildings with multiplicity of stories, to utilize which, stairs became an indispensable requirement as a means of reaching the several levels placed above one another; and for ages they have been submitted to as an evil without remedy. But during later years,

NUMEROUS DEVICES IN PASSENGER ELEVATORS

Have been invented and brought into practical use to relieve and obviate the fatigues and exertions of "stair climbing." And hundreds of thousands of persons who are "*afraid of elevators*," and speak of them as "*dangerous*," are nevertheless willing to "*risk their lives*" upon these "*dangerous contrivances*," to avoid the discomforts of reaching upper stories by means of stairways.

All this goes to show that stairs, while a common necessity in house construction, are more a source of enforced convenience than of comfort and healthfulness. And being so, their most perfect apportionment of run and rise should receive the most skillful and careful consideration, as no amount of expenditure of money, nor all the elegance and beauty of design or workmanship, can relieve the extra hardships imposed upon those compelled to use stairs not built in conformity with the best understood rules productive of "easy stairs."

What Is the Difference?

SOME of our readers may think that too frequent reference to the subject of sewer gases, is made in the columns of this journal. If health and life are immaterial considerations, then it is true. If they are important and valuable, then too much cannot be written or said. There is no intelligent person who will presume for one moment to dispute or deny, that where those poisonous vapors are breathed day and night, sickness and death must ensue. Their fatal character is beyond controversy, and the rapidity of their work depends only upon the quantity inhaled.

Reader, permit us to suggest the following: If a man should fell his wife, mother, child or friend to the floor by a blow, and he or she should die from the effects of the blow, would not a death be caused by the hand of him who struck the blow? Or if either should be pushed into the waters of the bay, and were drowned, would not he who did the pushing be responsible for the death? In either case, it would be murder, homicide, or manslaughter. Now then, if a man builds a home for his family, and its construction, appointments, and defects are such that the sewer gases are admitted, and loved ones die from the effects of those gases, is it any less a death? The blow caused death, the drowning caused death, and the gases caused death. The only difference is in the manner and circumstances of the cases. We shall not presume to say that there is the same degree of guilt in either case, but that the result is the same is certain. A man, woman, or child when killed, is *killed*, the only remaining question being the means and manner of producing the death. And when death occurs, whatever may be the cause thereof, the usual stereotyped notice occurs, "*In the providence of God, etc., it pleased the Lord to call him or her away*," thus making the Almighty responsible in all cases, while in so many instances in this connection sickness and deaths are caused by men assuming to know a great deal, yet possessing but a small amount of proper, practical knowledge in many important respects in the erection of homes for their families; doing, or permitting things to be done, at variance with all right rules and principles familiarly known to all intelligent physicians and architects to involve dangerous risks, if not fatal consequences. If the Almighty Being has anything to do with such cases, he simply makes fools of men, causing them to build imperfect and incomplete houses, and employ incompetent men to plan them, and others to execute the blundering work, so that he may kill off some loved one. We hold that God is not responsible for the bad judgment of men in the erection of their homes, nor does he require the blunderings of either architects, plumbers, sewer layers, or any other to work out his purposes. If he uses these means in any way it is to punish those who fail to observe the natural laws of creation and life, and bring upon themselves bereavements and sorrows.

A New Device in Blinds.

IN answer to several inquiries concerning Hill's Patent Inside Sliding Blinds, now being introduced on this coast, and whose advertisement appears on page 80, we give the following short description.

These blinds are made by machinery specially constructed for this work, from the best material; they are finished by hand, and are very neat, economical, and convenient. Although constructed of light material, it possesses more durable qualities than a hinged shutter. It can be closed with the window raised, and will not blow open or rattle.

As inside blinds are an important feature in most every building, too much care cannot be exercised in selecting that system and style of blinds whose general qualities are simplicity and convenience. Considerable objection has been raised against the inside folding blinds now in ordinary use, many people preferring to be without any rather than be bothered with their curtains continually catching when folding in and out. Many also object to the pocket at each side of the frame, as it forms a receptacle for dirt and dust.

The Hill Blinds are formed in compartments or sections, and are made to run in grooves, each section sliding past the other with secreted springs to hold them in position at any point. They are very easily managed, and are entirely out of the way of any article upon the window-sill; they do not in any way interfere with the curtains or draperies, and by pressing the blinds to the right, they can be instantly removed, and taken from the room and cleaned.

Wherever introduced, these blinds have given entire satisfaction. They are very popular in the Eastern States. And, as they are handsome in appearance, neat and durable, and cost considerable less than the folding blind, we think it would be advantageous to those interested, to call on Edward B. Hindes, 330 Pine Street, room 55, who is agent for the association on this coast, and see full size models.

Luck—"Good" and "Bad."

THERE are but few words in the English language more bandied and misapplied than the term, Luck; which is used to express some unknown, invisible, undefined something, having no tangible existence or application other than a speculative, convenient sentiment, utilized to fill endless numbers of gaps in the experiences and vicissitudes of life,—a substitute for the less acceptable idea of destiny; for if a man possesses in his moral, mental, or physical nature, or is specially surrounded with an influence or controlling principle or element which entitles him to the common appellation of a lucky or unlucky individual, then his fortunes or misfortunes must be the result of an agency not under his control, and not the result of clear discernment, good judgment, and prudent and discrete action; but is the enforcement of success or non-success by a power or principle which is wholly above and beyond the control of the recipients.

Those who pass through life enjoying its common comforts and successes without any specially noticeable occurrences, are considered simply good, careful business men, in nowise indebted to freaks of either good or bad luck. But those who by acts of shrewdness, cunning, or unscrupulous boldness make big strikes, and gather in great fortunes—perhaps millions—are regarded as "lucky;" "every move they make *wins*," while others of equal integrity and caliber would fail of like success under similar opportunities, because restrained by broader and more liberal views of justice and right beyond themselves.

The extravagant and reckless, as well as the weak-spirited, and those frequently out of work, alike draw their qualifications and consolations from the same source—"luck."

Those who have swamped fortunes in wild speculations, attribute their adverses to "ill luck." The criminal with the blood of his fellow creature upon his hands, and those guilty of lesser crimes, unite to patch up treaties with conscience by persuading themselves they have been the victims of circumstances—*unlucky*.

For all the faults and failures of men, their positive sins and culpable short-comings, "luck" is the antidote.

The Greeks and Romans fully accepted the theory of "luck," calling it destiny. Alexander the Great depended upon this pretext for human failures. Pliny says, "Some people refer their successes to virtue and ability, but it is all *fate*." Napoleon believed in his "star." Cromwell and Lord Nelson had similar ideas.

There are such things accredited as happy and unhappy accidents and happenings. We read of a painter who produced a long-sought effect by throwing his brush at the canvas in a fit of rage. Franklin ascribed his turn of thought and conduct through life, to the finding of a copy of Cotton Mather's essays.

It must, however, be admitted that very many most singular things occur. One man may seek to extract the juice from an orange, and perhaps meet his death by choking from the lodgment of a single seed in his throat, while another may have an iron bar run through his body and survive; another may but pierce his flesh with a thorn and die, despite the efforts of the best medical treatment, while another may swallow a jack-knife, pass it, and live on the full period of life unharmed by the event.

The thing called "luck" is but a bugbear—a delusion for the unphilosophical, spiritless, and indifferent to rest upon. The successful of human kind are those who do the right thing in the right way and at the right time. Those called "lucky fellows" are no more nor less than men who have been quick to utilize opportunities, and persistently follow up advantage, hunting for additional agencies and sources of wealth, and handling and protecting their gains in the one direction of profit and increase.

Luck as a doctrine or theory is demoralizing, delusive, and mischievous, and a cloak and covering for human faults and weaknesses. The things attributed to luck and chance as commonly understood, are but combinations of events, coming and going like all things in life, which, if seized upon at the right time, and successfully manipulated, yield their reward; while if neglected and allowed to pass by unimproved, they are but as the fleeting winds, those securing advantages being called "lucky," and those who do not, because they failed to succeed, through indolence or inactivity, are awarded the royal plume of "unlucky dogs."

THE New York Court of Appeals has recently decided a case involving a building contract, confirming the decision of an inferior court. The New York *Daily Register* gives a rather meager report of the case, but there are several interesting points in the decision. The circumstances seem to have been that a certain builder contracted in the usual form to erect a house under the direction of a firm of architects, and with the ordinary stipulation that no payment should be made until a certificate of the architects that the payment was due had been presented to the owner. There was another provision in the contract to the effect that disputes concerning the construction or meaning of the plans should be decided by the architects, but that any other difference between the parties should be submitted to the arbitration of two competent and disinterested persons, to be selected in a specified manner; and a forfeiture for delay in completion was also agreed upon. The house was not completed for four months after the contract time, but the owner then moved in. The builder applied to the architects for a final certificate, but was told that the owner had instructed them to give no more certificates. He then went to the owner, who pointed out some little matters still remaining unfinished, and told him that when those were done he would pay at once the balance due, after deducting the amount of the forfeiture for delay. It would seem that this promise was not fulfilled, for the builder subsequently brought suit for his money. The defense claimed that the certificate of the architect was agreed to be a necessary prerequisite to obtaining payment, so that the owner was not bound to pay anything until this had been produced; and as the builder failed to bring the certificate, he had no right of action against the owner for refusing to pay.

Many decisions show that under ordinary circumstances this is an unanswerable argument but in the present case it was not disputed that the owner had instructed the architects to give no more certificates, and the court held that the owner, who had introduced the stipulation in regard to certificates into the contract for his own benefit, might waive it, and that, "if he accepted the house as under a completed contract, the plaintiff would be entitled to recover, although no certificate had been given, and even if the architect was not satisfied." Another point was made by the defense, that, as the contract provided that all differences not relating to the construction of the plans should be decided by arbitration, this stipulation should have been complied with before bringing suit. In regard to this the court held that it was no more the duty of one party than of the other to resort to arbitration, and as the defendant, so far as was shown, took no steps toward the selection of arbitrators, it was unnecessary to consider this defense. The questions which the jury was called upon to consider were two in number, the first being whether the owner accepted the house as a completed building under the contract; and whether, if it was so accepted, the delay in its completion was caused by the owner's fault. What was the jury's decision we do not know, but the Court of Appeals held that these questions were properly submitted to it, and confirmed the verdict. The case is called Smith *versus* Alker, and seems to have been decided some time in March last. It is worth observing that the ground on which the jury decided that the owner had virtually accepted his house as complete seems to have been rather his promise to pay the contract price when certain small alterations had been made, than his occupancy of the building. It has been decided more than once, we think, that the owner's moving into a new house does not constitute an acceptance of it, but in the present case the fact of his moving in, coupled with the assurance to the builder that he would pay the balance of the price, less deductions for delay, as soon as some small matters had been attended to, seems to have been regarded as a virtual acceptance from which he could not retreat without good reason.—*American Architect and Building News.*

Carpets and Decoration.—It is a great point in house decoration to secure carpets that accord with wall and ceiling tints and patterns, where these have been already put on. Irregular patches of color in carpet do not show well w ere wall and ceiling hav methodical and carefully considered designs. The carpet, too, should be responsive to warm, or brilliant, or delicate tones in these. Many a decorator suffers in reputation from the incongruity of a carpet introduced after he has done his work. As a general rule we are inclined to think that any recurrence of geometrical patterns, inclosing compartments of large size, is fatal to the success of a carpet design. The best patterns are neither up and down, nor "all over," but are evenly distributed over the whole area, or arranged with reference to a center toward which the accessories work. Some excellent combinations are those in which, on a field or ground of some secondary shade, the pattern consists of some small repeats, touched slightly with primary colors in various tints, relieved or edged with gray.

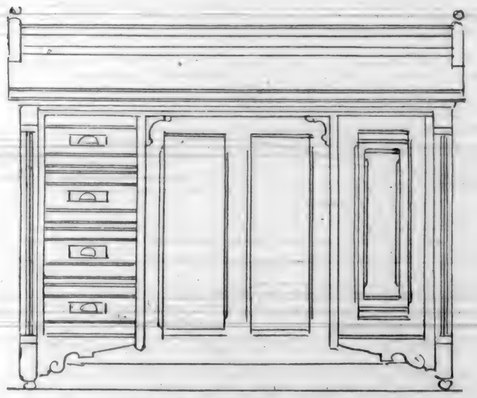
SIDE ELEVATION BROKER'S DESK.

New Zealand Insurance Company.

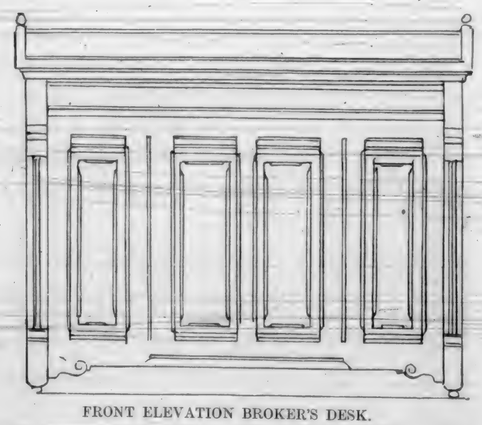
In November, 1883, we illustrated the proposed new building of the New Zealand Insurance Company, to be erected in this city on their property, 310, 312, 314 California Street. The Pacific Coast manager, Mr. Hugh Craig, has lately returned from a trip to the head office, Auckland, New Zealand. The company, for the present, have decided to let the old buildings remain and fit up for their own convenience No. 312. To carry out this idea Messrs. Wright & Sanders were employed to prepare designs for the interior fittings. How well their instructions were carried out may be seen by a visit to the company's new quarters between the hours of 9 A. M. and 5 P. M.

The contract for the carpenter and mill work was given to Mr. W. A. Knowles, of Oakland. The interior decorating is the work of Cook Bros., 108 and 110 Post Street.

A general idea of the arrangements may be gathered from the accompanying desk elevations and interior perspective on following pages. All the woodwork is in solid Eastern oak. The wainscot is surmounted by a band of Lincusta Walton 15 inches in width. The frieze and cornice are frescoed in cool, light greys, producing a very pleasing effect, and displaying excellent taste in this style of decorating. A vault of solid brick and cement 18 feet 6 inches by 9 feet 9 feet has been built across the rear of the room. The area of the office is 18 feet 6 inches by 68 feet 6 inches, and is only sufficient for the City Fire and Marine Departments.



REAR ELEVATION BROKER'S DESK.



FRONT ELEVATION BROKER'S DESK.

We note from the last quarter's report of the Underwriters' Fire Patrol of San Francisco, that there are ninety-six fire companies operating in this city, and that the receipts of the New Zealand Insurance Company are neither least or last. The New Zealand has, since its advent upon this coast in 1875, taken a prominent position in the matter of receipts, as well as figuring in every large fire, and many of the smaller ones, from which our city has suffered during the last eleven years.

The property upon which the offices are located was purchased from Sir Robert Burnett, Aberdeen, Scotland, the Newhall heirs, and M. Rosenbaum of this city. The frontage of the three properties is 60 feet on California Street, with a depth of 124 feet, with a rear frontage on Halleck Street of 60 feet 6 inches.

When foreign capital, represented by companies of this standing, comes among us and identifies itself with our citizens, we cannot do better than give it our earnest support. Had the above investment been made by a company hailing from London, we would not have been at all surprised, because we can give them a much greater return than can be obtained in the United Kingdom. But it has remained for the most progressive and youngest of Britain's daughters to come to us and put New Zealand money, which brings a higher rate of interest at home, into property in San Francisco.

We wish them continual prosperity, and hope the receipts of this bold and conservative company will so far exceed the losses and expenses as to justify them in soon erecting the large building and spacious offices for which Messrs. Wright & Sanders have already prepared plans.

The following brief history, showing the progress of this company, was handed to us by Mr. Hugh Craig, Manager for the Pacific Coast:—

"The company was established in Auckland, New Zealand, May, 1859, with a paid-up capital of $24,225. In 1862 its paid-up capital had increased to $75,000; in July, 1863, to $150,000; in July, 1864, to $225,000; in January, 1865, to $250,000; in 1871, to $375,000; in 1873, to $500,000; and to-day the paid-up capital stands at $1,000,000; assets, over $2,750,000, with unlimited liability of shareholders."

To Imitate Black Rosewood.—The work must be grounded black, after which take some red lead well ground and mixed in the usual way, which lay on with a flat, stiff brush in imitation of the streaks in the wood: then take a small quantity of lake, ground fine, and mix it with brown spirit varnish, but not with more color than will just tinge the varnish, and if still too red, add a small quantity of Vandyke brown. If the work is well done, the surface, when varnished and polished, will scarcely be known from rosewood.—*Painters' Magazine and Coach Painter.*

Shingle Roofs Should Be Well Painted.—There is no portion of a building of greater importance, and none subject to greater "wear and tear," than the roof. And as a general rule, no part which receives so little attention after it is on. Owners seldom trouble themselves about the roof so long as it keeps out the rains, and no effort is made to preserve it, until it begins to leak; by which time the decay assumes such magnitude, that patching and repairs simply prolong for a year or two, the time when the putting on of a new roof will become inevitable. All exposed portions of buildings require constant attention and care, and this is supremely true in reference to roofs, whether laid of shingles or metal. Shingle roofs may be preserved for a lifetime, by being properly painted when new, followed by additional coats at proper intervals. The preservative advantages of painting shingle roofs have not attracted general attention from either owners or architects, although there is no place in the known world where the necessity is greater than in California, particularly in San Francisco, where as an almost universal rule none but thin redwood shingles are used. The severe and sudden changes to which roofs are subjected, of hot suns, heavy fogs and dews, drying "north winds," occasional spells of "scorching heat," heavy rains, etc., etc., are very severe upon so light a roof covering as the fragile redwood shingles. It is, therefore, wise to protect them by painting, which increases durability, adds largely to appearances, and if a really *good fire proof paint* is to be found, and is used, gives security from fire to a considerable extent; as burning embers falling on a roof so painted, will not ignite the shingles.

Editor California Architect—*Dear Sir:* How few there are who give credit to the architect, or appreciate his many perplexing studies. He is expected to furnish, off-handedly, all information demanded of him, by whomsoever asked, whether the inquirer be a tailor, a shoemaker, a hatter, a blacksmith, or even a full-blown flower of femininity—an old maid. Even the judicial mind makes demands upon the mental resources of the architect, and but little credit is given for the numerous and varied experiences and studies necessary to all this. The professional architect is looked upon as one whose mind is equal to a common library.

If *duly qualified* as such, he stands at the head of all the professions. He must be a good geometrician; must be skilled in the art of writing up contracts and bonds; must be fully conversant with the strength of all building materials—wood, iron, stone, bricks, cement, etc.; also the market value of lumber of all grades—hardware, wrought and cast iron, glass, paints, slate, plumbing

INTERIOR OF NEW SAN FRANCISCO OFFICE, NEW ZEALAND INSURANCE COMPANY, 312 CALIFORNIA STREET.

materials, etc. Also enjoy a knowledge of the difficult science of acoustics—a study requiring a large portion of a life-time to gain proficiently. In addition to all these, the mechanical science of construction, ventilation, proportions, symmetry, foundations, stairs, and innumerable other things must be well, if not absolutely perfectly understood.

But in the matter of remuneration, it is too often the case that the professional man's services are demanded upon the basis of but little better than day's labor compensation, although his services are expected to be almost inestimable. If the standard of remuneration for architectural professional services could be measured by the rules applied in other professions, where far less hard mental work and general knowledge are required, the profession would represent a large amount of wealth. The doctor, for a dime's worth of powder, or a shilling's worth of fluid, accompanied by a grasp of the wrist and a glance at the tongue, is at liberty to demand five or perchance ten or more dollars as a fee for services *received* if not rendered in good faith, which multiplied by numerous patients each day, must—as it does in numerous cases—rapidly augment the cash or bank account of the medical man, and enable him to erect buildings, and luxuriate in all the pleasures of a fine span of horses, with appurtenances, etc.

The legal brother professional likewise for an hour's consultation may demand a fee of twenty-five to a thousand or more dollars, and the charge is more frequently paid than refused. But the architect is drawn down u der taught, financial lines, without any of the soft snaps enjoyed in the other professions. The architect must content himself with wending his way to buildings under charge as best he pleases, through mud, slush, and dust, and move around through mortar beds, under plasterers' scaffolds, to be besmeared with the compound of lime, sand, and hair; climb up ladders and upon scaffolds of not over safe construction, over roofs and dangerous places, sometimes spoiling a whole suit of clothes, lime burning a pair of boots, and knocking fifty per cent out of the value of a silk hat, if such a luxury is indulged in,—all in daily devotion to the duties imposed upon him as an architect.

But these are not all; at the office, numerous interviews draw upon time, and days in each month are wasted in profitless intrusions upon valuable time. Endless questions have to be answered, work on the boards criticised and corrected, calculations and estimates prepared, documents to write up, and the days filled up with cares and watchfulness for the best interests of clients, and sketching and planning carried late into the hours of night.

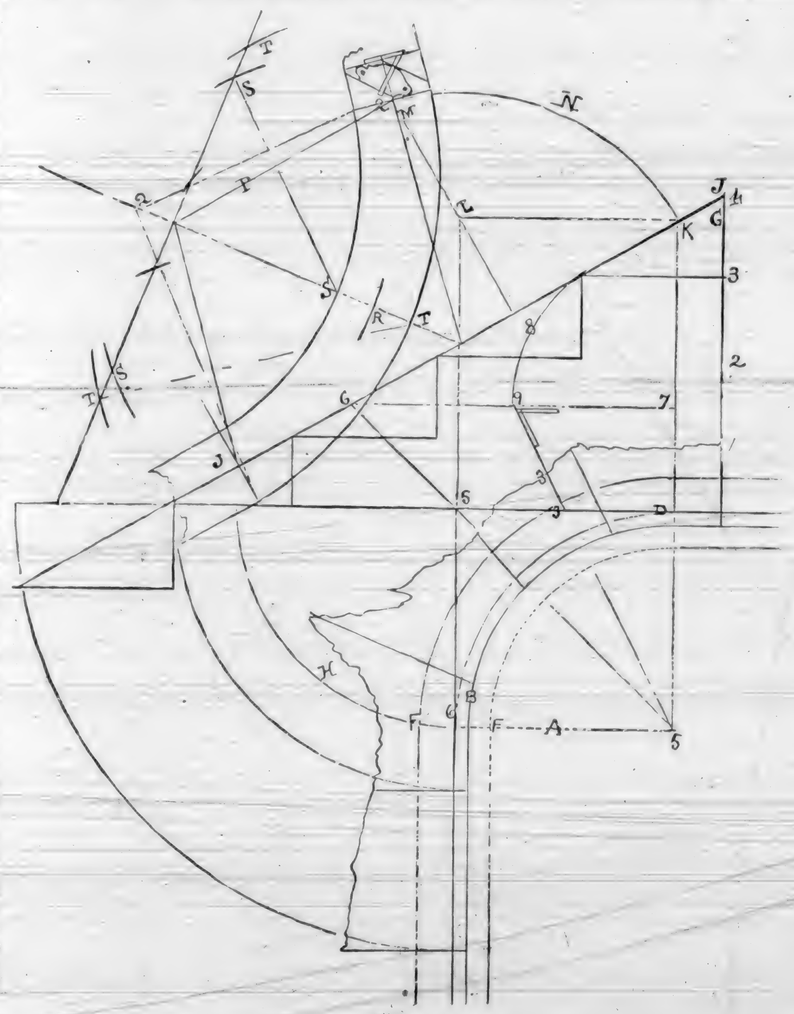
Pardon if I have assumed too much in this writing; but I have been so much in contact with architects' offices in so many States and large cities in the Union, that I feel an interest in the high and honorable profession, and regard its worthy, intelligent, and proficient practitioners as men entitled to the highest considerations. And pity it is that the profession is marred by a single individual whose exalted standing in point of honor, competency, and invulnerable integrity and trustworthiness are not such as to defy criticism.

THE following cut furnishes a *graphic illustration* of finding the cuts over a quarter turn stairs. Let B be the face of cylinder; make C, D the center of rail; make half breadth of rail right and left of C, as F F; square through center of rail from C and D to 5′, as tangents of rail falls there; space off the risers in the cylinder as shown; set up the height of risers, as 1, 2, 3, 4; now continue line D, 5 to J; take compass and stand in 5, and draw curve from F to line 5 J; do the same with curve I; next draw the line of pitch from J to J, 4; continue line from D to K; likewise line 5 to L; square from K, D, over to L, from pitch line J, J; square through L; take compass, and stand in 1; open out to K; draw curve N, cutting line M, M at 2; connect 1 and 2; which will give the tangent in mould; make line J, O parallel with line 1, 2; make line P, 2 parallel with J, 1; we will then have the parallelogram wherein the mould is found.

Now to find the bevel, draw through 5, 5′ to 6; square from 6 over to 7; stand at 7; draw curve 8 to 9; connect 9, 5; that gives the bevel; breadth of r il is found at 3, 3; take breadth of rail; lay off each s de of 2 and J; now find the pin points, and draw the curve of ould; after mould being drawn, you can cut and stand up as a model.

Explanation: Cut around curve S; cut from J to 5′, from 6 to J 4; from 4 to line D; hinge from 5′ to 1, from 5′ to D, from J to 6; cut across the joints and stand up.

M. J. M.



S. F. Chapter of Architects.

THE regular routine of business being disposed of, and the member designated to address the Chapter on "Ancient and Modern Plumbing" not being present, and having by letter informed the Secretary that it would be impossible for him to prepare a paper for the occasion which would be to him satisfactory, or instructive to the Chapter, other subjects were taken up and discussed until a late hour, with earnestness and profit.

Mr, Williams presented a drawing delineating a device for safety at elevator wells in cases of fire, which was favorably received and commented upon. The necessity for greater security in this connection was admitted, and it is only a matter of time when—as the outcome of destructive conflagrations—a practically perfect method will be found, serving that purpose, without the necessity of inclosing elevators in brick or iron shafts.

The recent destruction of Bancroft & Co.'s building, and facts known in connection with its construction, were freely talked over, with no flattering comments as to its sufficiencies as a five-story structure. It is generally understood that the best quality of hard-burned brick, laid in mortar composed of a good and sufficient quantity of Portland cement, were not imposed requirements at the time the building was erected; consequently the walls were not the most difficult ever built to topple and fall. The ruins, of course, expose the system of bond irons employed, which, if sufficient to meet the requirements of the fire law at the time the building was built, would not be so considered at the present time by any qualified architect.

The construction of the walls was such as is generally employed in California, as far as the *bond* is concerned; *i. e.*, headers each fifth course. The value of this method of bonding was contrasted with that of the English and Flemish bond, with no concession in favor of the former, except custom and cheapness.

This was followed by a general and earnest discussion of the matter of plan competition in connection with the Stockton Court House, Hall of Records, and jail.

The course determined upon by the Board of Supervisors having the matter in hand was reviewed in plain terms and condemned as unjust, iniquitable, and promotive of, if not designed to cover up purposes and intents which dare not face the clear light of square and upright dealings. It is well understood, and well and conclusively known by all intelligent architects having any experience in such matters, what is meant and intended by $800 for the first, $400 for the second, and $300 for the third best plan—all of which, however, to remain the property of the Board. The *joker* in such cases is an old familiar card, and cannot be played with impunity upon those understanding the game.

It may be that the San Joaquin County Board may be better than other Boards have been, and may be innocent in the error they have made. But if so, then they had better seek shelter by resigning, as the responsibility of what they propose to do must rest on them, whether they are acting and do act understandingly and intelligently for themselves, or are the servitors of others.

There have been too many of the unfair and unjust, and too few honorably and equitably conducted competitions for informed and competent architects not to feel aggrieved at the repetition of what, upon its face, is transparent in the case under review; and while the members of the Chapter recognize their entire inability to reform the abuses practiced in such cases, or to convince those who have happened or managed to be placed in position, to repeat another competitive wrong in the Golden State, they have the right, as architects, citizens, and men, to express in unmistakable terms their hearty disapproval of the method and manner of competition resorted to by the Stockton managers.

Mr. Sanders presented a drawing, delineating a most ingenious device applicable in testing the strength of timbers in various ways, utilizing a one pound weight in a given position to produce a pressure at another point of 2,000 pounds. The whole affair is simple and possible of being made useful in many ways. Mr. S. proposes to complete a working model of the device.

A committee was appointed to consider the Stockton competition matter, and report resolutions in reference thereto to a special meeting of the Chapter, to be held on the 14th inst.

"FAMILY colors" is a term familiar to English coach painters. In this benighted land of ours, under the new order of things, there is no distinction in "regard to color or previous form of servitude."

PURE linseed oil may be free from adulteration, yet unfit for use, because not properly refined, or freed from mucilaginous matter.

Transparent Colors.

IT is well understood that transparency in the proper sense is opposed to opaqueness. A transparent body—strictly speaking—suffers rays of light to pass through it, so that objects can be seen distinctly.

Air, water, and glass are examples of transparent bodies. The word, however, is sufficiently accurate for all practical purposes, and, although in the use of a transparent color we cannot see the ground color over which it is laid, still the groundwork exerts a modifying influence on the so-called transparent color, and the educated eye of the painter sees the ground color, or at least is conscious of its modifying effect on the superimposed color. There is a mutual support between the two, a giving and taking, the end sought being what painters term depth and richness, which cannot be gained by an opaque or heavy-bodied color.

An opaque color presents to the eye a compact film, while the beauty of a glazing color is due to its property of lying loosely, so to speak, and as varnish is employed the color is asserted by the transparent medium.

The painter may obtain transparent colors in crimson, scarlet, purple, blue, yellow, green, and brown, and semi transparent ones of less purity of tone; and as the may be used clear, over various grounds, mixed with one another, or modified by small proportions of opaque colors, every desired effect presented in nature may be correctly imitated, and the extreme richness be produced on surface work.

Carmine and the lakes, from cochineal and the madder root, supply all that is desirable in red.

Dutch pink, Italian pink, and patent yellow furnish the yellow tones, and ultramarine stands unrivaled as a blue.

Verdigris, emerald green, and green lake add to the list transparent greens of great beauty; and asphaltum has no equal among the browns. Raw sienna supplies a dull yellow, and burnt sienna a very valuable brown orange. The list might be somewhat enlarged, but those given comprise those which are most useful.

An opaque color may be rendered semi-transparent by using a large proportion of the vehicle to that of color, but such mixtures are comparatively of but trifling value.

Transparent colors are usually applied so as to retain the tone of the pigment, as it appears when moistened with oil or varnish. Thus scarlet, crimson, and purple-toned lake are painted over grounds of light and deep vermilion, Indian and Tuscan red, and as greater depth of color is desired, the change is made in the ground color. A very brilliant red is produced, by giving a thin wash of carmine over vermilion, and the same shade of carmine may be deepened through browns of varying depths, the limit being black. We may glaze lake over blue, or blue over lake, and produce purple and violet hues, but this is not generally practiced outside of striping and ornamenting. The red-toned lakes place at the disposal of the painter a wealth of warm glazing colors; in fact, nothing better could be imagined.

Next in order is yellow, which is termed an advancing color, and when free from the orange cast, and is glazed over white, or delicately tinted grounds, produces brilliance, without gaudiness.

Patent yellow gives clear, bright tones. Dutch pink and yellow lake, when "wet up," are of a dull yellow, and may be glazed over drab ground-colors, with good effect, but they are at present employed to add richness to what are termed sea, bottle, and olive greens. In this arrangement, the true color of the yellow is hidden, and its yellow tone interposes between the foundation color and the eye, a yellow medium thus producing transparency and richness that cannot be gained by any other means.

The soft, mild green, produced by English varnish over black, is well known to coach painters, and they know also, that the precise tone cannot be imitated.

A pure, dark, rich blue is supplied by ultramarine blue. It may be classed as more retiring than many shades of green that are popular, and yet blue is but little used for panels.

It is usually glazed over, dark lead color, and mixtures of Prussian or Antwerp blue and white.

But that is by no means the limit, as it may be successfully glazed over white, straw color, yellow, orange, etc., etc.

Verdigris is a perfectly transparent, bluish green, of exceeding beauty, and in former times was in constant use by coach painters, for the panels of heavy work.

Ornamental painters are now lavish of it on gold and silver leaf, and it has almost lost its place as a panel color.

Among the browns, asphaltum is the most transparent, and when painted over a dark groundwork, imparts richness, all its own.

Transparent colors are sometimes modified or changed by the addition of those that are opaque. Thus, burnt umber and yel-

low lake, or Dutch pink, produce a soft, warm brown; Prussian blue gives a rich green, and so on. The reverse of this process is to add a small proportion of the transparent to the opaque color, as lake added to Indian or Tuscan red, and to the strong-bodied, mixed browns. Of course this is in the line of economy, the purpose being to retain the body or covering power of the opaque color, and a tinge of richness from the transparent one. There is scarcely a limit to the variety that may be produced, and hence the skilled painter has no difficulty in bringing out new effects in colors.—*Painters' Magazine and Coach Painter.*

Mistakes in Building.

OWNERS are often sadly disappointed and grieved at their mistakes in the means adopted by them to avoid the expense of an architect, and obtain plans for their buildings. Sometimes they know, or become acquainted with some *honest mechanic*, to whom they are induced to intrust the whole matter of plans, specifications, and construction, only to repent when it is too late. The party to whom the proposition is made, elated with the splendid opportunity opened up to him, and full of conceit in his own abilities, uses all possible means to secure and consummate the arrangement, and plans are made—*and such plans!*—and the work progresses. Once under way, there is no stopping it, and step by step the owner discovers and realizes, one after another, grievous errors, which are difficult to remedy. And when the building is completed, he simply feels disgusted. Imperfect arrangement, poor construction, homely design, and incurable defects crowd upon him, as the reward of his folly; and regrets for his error haunt him day and night, but it is too late—the building is erected, and he must endure its defects.

But the first general dissatisfaction is primary and bearable, compared with after experiences in their various details. The plumbing work has, perhaps, been done by some tenth-rate man—some spoiler of good materials, who calls himself a "practical plumber," but who has not the slightest idea of what constitutes a really good job, not to say first class. Nor would the payment of ten times the value of the work done secure skillful workmanship at the hands of such men, for the simple reason that they do not possess, and therefore cannot practice, mechanical skill and abilities. And owners who employ this class of plumbers are unfortunate, indeed. But to continue, defects show themselves in all connections. Pipes, under the old free and easy rule, were put in of insufficient capacity, wastes entirely too small, and sometimes so cramped in making bends as to diminish their practical size one-half. "Tinker" instead of "wiped" joints; leaks at various points and places; wetting and spoiling ceilings and walls, and not infrequently carpets have to be torn up to escape the deluge. All this was followed by a still more serious defect—one affecting the health and lives of the occupants, *viz.*, imperfect or insufficient traps, pipe ventilation, bad sewerage, etc., resulting in the distribution of the vicious and poisonous sewer gases through the building, and as a consequence, the ill health and sometimes *premature death* of loved ones. The intended pleasant home is thus transformed into a mere fume-castle, a disease-breeding charnel house, not fit for human habitation.

All this is followed by continual repairing, tearing up floors, removing finishes to get at concealed places, etc.; and for all this the owner has been made to pay a good round price, amounting to more, as a rule, than it would have cost him to have secured a good building erected under the superintendence of a trustworthy architect. But bad plumbing work is not the only serious defect which so often occurs in such cases. The foundation is often wholly insufficient, and settling occurs, with any quantity of ugly cracks in the plastering. The structure is perhaps so poorly braced that the edifice trembles with every wind that blows. And when the rains fall, leaks are found at every exposed window and opening, and the roof itself yields its proportion of internal wettings. But we will not continue our enumeration of "bad things," as to do so would consume columns of space. Such cases are known to all architects, and many a "served him right" is indulged in, upon the principle that a competent physician laughs at the sufferings of a patient whose pains and agonies result from self-treatment or quack practice, and the educated lawyer smiles when his client gets himself into a *terrible fix* by intrusting his case to some pettifogger, or who tries to work out the intricacies and problems of law by his own self-conceived legal ingenuity.

UNCOVERING THE BASE OF THE SPHINX.—Since the 7th of January last, several hundred Egyptian fellaheen have been at work under the direction of Brugsch Bey (formerly commissioner to the Centennial Exhibition) removing the sand which has hitherto enshrouded the great Sphinx up to its very neck. By the end of this month the whole of it, amounting to over 20,000 cubic meters, will have been removed, and the grand old monument, raised by the Pharaohs over 4,000 years ago, will be again visible in all its beauty. A high wall is being built around it, to prevent the desert-sands from again submerging it.—*New York Mail and Express.*

THE ARCHITECT OF THE CELESTIAL KINGDOM.—The Mormons have just had another revelation from Heaven, which indicates that their prophet, the late Mr. Joseph Smith, is much more innocently employed there than he was on earth. They are building a big tabernacle at Provo, the second city in importance in Utah Territory, and the architect, a Mr. Folsom, was much perplexed about the entrances and exits, when (so he says) the Prophet Joseph appeared to him in a vision and straightened out the crookedness, remarking that architecture is his particular employment in the celestial kingdom. The Salt Lake *Herald*, a journal run by Mr. Caine, the Mormon delegate in Congress, observes:—

"As the arrangement is altogether novel, and a great improvement over similar edifices throughout the Territory, there is no reason for discrediting Mr. Folsom's somewhat startling assertion."

We recommend this seemingly well-attested vision to the consideration of the American Institute of Architects. We have heard that when the elevators were put into the Equitable Life Assurance Society's Building on Broadway, the contractor successfully consulted his deceased father or uncle, through a medium in Ohio, for the plan of them. If the Institute can make a permanent arrangement with the late Mr. Smith for professional services in difficult cases, it will be a great thing for American architecture. It is a pity that some way to communicate with him was not contrived during the building of our local monstrosity, the New York post-office. But it may not be too late even now to call him in for consultation about the Albany capitol.—*New York Herald.*

LIENS UPON PUBLIC BUILDINGS.—A decision of the supreme court involving the question of the validity of mechanics' liens upon public buildings, holds that liens of this character are contrary to public policy, and therefore void.

Parties contracting for the erection of this class of structures should therefore bear in mind the fact that the Lien Law affords them no protection in case of failure on the part of boards, and commission controlling constructive—public—works to pay the contract sum. There are methods by which collections may be reached, through suits, relief bills, etc., but these are always more or less vexatious, and often very expensive to the creditor.

Building Intelligence.

B

Broadway, south side, bet. Gough and Octavia. Two two-story frames.
O.—T. C. Delamater.
C.—G. M. Salsbury.
$5,000.

Bryant, nr. Third. Two two-story frames.
O.—J. Curry.
A.—J. J. & T. D. Newsom.
C.—J. Adams.
$11,000.

Broderick, cor. Hayes. Two-story frame.
O.—J. Klopfer.
A.—H. Geilfuss.
C.—T. Von Borstel.
$3,600.

Broderick, nr. Hayes. Two-story frame, two flats.
O. and B.—R. S. Williams.
Day work.
$3,500.

Broderick, near Grove. Two-story frame.
O.—Mrs. Russell.
A.—McDougall & Son.
C.—Kerrigan & Lufkin.
$4,000.

Broderick, nr. Fulton. Two-story frame.
O.—H. R. Levy.
A.—J. Chadwick.
C.—H. G. Monrad.
$4,000.

Broderick, bet. Fulton and Grove. Two-story frame, two flats.
O.—H. Mayer.
A.—J. Chadwick.
C.—H. G. Monrad.
$4,500.

Bush, bet. Baker and Lyon. One-story frame.
O.—W. D. Nicholson.
C.—G. G. Gellespie.
$2,500.

C

Castro, cor. Fifteenth. One-story frame
O. and B.—T. Darcy.
Day work.
$2,000.

Castro, cor. Seventeenth. Two-story frame.
O.—D. Wulzen.
Day work.
$6,000.

Church, nr. Twenty-fourth. Additions.
O.—J. Duffy.
Day work.
$700.

Columbia, nr. Harrison. Additions.
O.—H. B. Russ.
A.—McDougall & Son.
C.—J. H. McKay.
$2,500.

California, bet. Buchanan and Webster. Additions.
O.—H. Erlunger.
A.—C. Kenitzer.
C.—H. Jackson.
$5,000.

D

Devisadero, nr. Oak. Two-story frame.
O.—J. Gatto.
C.—J. Sheppard.
$2,500.

Devisadero, bet. Hayes and Fell. Alterations.
O.—J. R. Dwyer.
A.—S. & J. C. Newsom.
C.—J. H. McKay.
$600.

Dupont, cor. Geary. Four-story and basement brick.
O.—A. M. Davis, of Davis Brothers.
A.—Copeland & Banks.
Carpenter work—Treadwell & Thompson, $13,685
Iron work—O'Connell & Lewis, 21,419
Sidewalk lights—Mahoney Bros., 4,081
Total, $39,185

E

Eddy, cor. Devisadero. Two-story frame.
O. and B.—F. Buckley, Jr.
A.—J. H. Humphreys.
$3,500.

Ellis, bet. Pierce and Scott. One-story frame.
O.—Mrs. Lang.
C.—W. Pluns.
$2,500.

Eighteenth, nr. Shotwell. Additions.
O.—F. Kruz.
Day work.
$6,000.

Ellis, bet. Webster and Fillmore. Two two-story frames.
O.—J. Levy.
A.—J. Marquis.
C.—J. H. Sheppard.
$6,500.

F

Fifteenth, bet. Castro and Noe. Two-story frame.
O.—J. Healing.
A.—R. Warren.
C.—J. M. Maher.
$4,800.

Fulton, nr. Scott. Two-story frame, two flats.
O.—F. Volkmann.
A.—Salfield & John.
C.—B. Dryer.
$4,000.

Fifteenth, nr. Market. Two two-story frames.
O.—H. Horstmann.
A.—Salfield & John.
C.—J. Klein.
$7,000.

Fifth, bet. Bryant and Brannan. One-story frame foundry.
O.—W. T. Garratt & Co.
C.—C. W. Kinsman.
$4,800.

Folsom, nr. Twenty-second. Five two-story frames.
O.—M. Kane.
A.—M. J. Welch.
C.—Barrett & Cremar.
$12,000.

Fulton, bet. Fillmore and Steiner. Two-story frame.
O.—
Day work.
$4,500.

Franklin, southwest cor. Post. Six two-story frames.
O.—H. Moffat.
A.—Curlett & Cuthbertson.
C.—P. Crichton.
$42,500.

Fifteenth, bet. Noe and Castro. Two-story frame.
O.—James Healing.
A.—George E. Voelkel.
C.—Jos. W. Maher.
$4,500.

Freelon, bet. Fourth and Fifth. Two-story frame school-house.
O.—Father Nugent.
A.—J. J. Clark.
C.—M. Lynch & Preston & McKinnen.
$9,500.

Fell, nr. Buchanan. Additions and alterations.
O.—Geo. Purlenki.
A.—H. Geilfuss.
C.—H. Meyn.
$3,500.

G

Guerrero, bet. Eighteenth and Nineteenth. One-story frame.
O.—J. J. Carroll
A.—P. R. Schmidt.
C.—Cormack & Elam.
$2,200.

Geary, cor. Taylor. Additions and alterations.
O.—F. Bruntz.
A.—J. M. Curtiss.
Day work.
$15,000.

Grove, bet. Larkin and Polk. Two three-story frames.
O.—A. Fassman.
A.—P. R. Schmidt.
C.—A. Norton.
$8,000.

Grove, nr. Polk. Armory Building.
O.—2d Regiment, N. G. of California.
A.—John J. Clark.
Day work.
$6,000.

H

Hickory, nr. Gough. Two-story frame. Two flats.
O.—W. Lang.
A.—Salfield & John.
C.—J. Klein.
$3,000.

Harrison, nr. Second. Additions.
O.—R. Mayers.
C.—J. C. Brown.
$2,000.

Howard, bet. Eleventh and Twelfth. Additions.
O.—J. Crowley.
A.—M. J. Welch.
C.—E. & F. J. Owens.
$2,000.

Harrison, cor. Twenty-sixth. One-story frame.
O.—John Ryall.
C.—J. O'Connor.
$1,700.

Harrison, bet. Twenty-fifth and Twenty-sixth. One-story frame.
O.—Mrs. Curran.
C.—W. McKeon.
$900.

Herriman, nr. Fillmore. Two-story frame.
O.—H. Easburg.
A.—W. H. Bayless.
C.—Schaffer & Co.
$2,300.

Haight, nr. Fillmore. Two-story frame.
O.—Mrs. C. Shaw.
A.—S. & J. C. Newsom.
C.—J. Rebman.
$5,000.

Haight, nr. Pierce. Two-story frame.
O.—Dr. G. L. Fitch.
A.—A. J. Nicoll.
C.—R. M. Murry.
$4,200.

Hyde, bet. California and Sacramento. Two-story frame.
O.—A. Gros.
A.—Pissis & Moore.
C.—James Geary.
$6,000.

Haight, northwest cor. Pierce. Three-story frame.
O.—T. Lundy.
A.—T. J. Welch.
C.—J. A. Hayden.
$7,500.

HILL'S PATENT INSIDE SLIDING WINDOW BLINDS

Are Adapted to Any Style of Window

And Suitable for all Buildings, Dwellings, Stores, Office Buildings, and for Houses Built to Rent, Boarding or Lodging-Houses are Unexcelled.

THEY are entirely inside of the window casing, and while requiring no furring out or boxing, make it an impossibility to tear curtains, interfere with plants or window ornaments, or become broken by contact with chairs or other movable articles.

The light can be admitted and sunlight excluded from any part of the window; can be instantly removed and taken to any part of the house to clean, and as easily replaced.

They can be opened or closed with the window raised, and without removing articles from the window-sill, and cannot blow open or rattle. The Blind is very light (one-half inch in thickness) and strong, possessing more durable qualities than a hinged blind one inch in thickness.

There is NO SAGGING, BANGING, OR GETTING OUT OF ORDER!

They are made in three sections in height (each section sliding past the others), and any number of divisions in width corresponding to the folds in the old-fashioned folding blinds. They require NO HINGES—all trimmings furnished with blinds—are MADE OF ALL WOODS, finished or unfinished, and COST LESS than old-style folding blinds. They have been extensively used by the best architects and builders throughout the East and West, and have given perfect and entire satisfaction wherever introduced.

The following are a few of the owners who have adopted the HILL BLIND in preference to any other:

U. S. Government, four sets officers' quarters, Presidio Res., S. F.; H. F. Bruns, cor. Geary and Taylor, S. F.; J. C. Weir, Post, near Scott, S. F.; John MacKenzie, cor. Grove and Broderick, S. F.; L. H. Sweeney, San Rafael; R. B. Gray, cor. Pacific and Van Ness, S. F.; Raymond Hotel, 1,600 windows, Pasadena, Cal.

ENGLISH AND AMERICAN VENETIAN BLINDS

IMPROVED.

The only Perfect Venetian Blind in the market. For samples, prices and information, address,

The Average Life of Buildings.....88

Summary of Building Activities.

THE building trades have been fairly active during the past thirty days, with results as shown by our summary of facts and figures, as follows:—

Engagements, frame, 82	Cost,	$346,379
" brick, 1	"	10,000
Alterations and additions, 12	"	45,160
Total for the month, 95	"	$401,539
FOR THE SAME PERIOD IN 1885.		
Engagements, frame, 126	"	$469,100
" brick, 2	"	72,000
Alterations and additions, 20	"	60,810
Total for the month, 148	"	$601,910
Showing a decrease for 1886 of—Engagements, 53	"	200,371
First Quarterly Report for 1886—Engagements, 252	"	$1,359,532
Second Quarterly Report for 1886—Engagements, 418	"	2,127,101
Total for first six months, 1886—Engagements, 670	"	$3,486,633
First Quarterly Report for 1885—Engagements, 291	"	$1,967,750
Second Quarterly Report for 1885—Engagements, 463	"	2,299,625
Total for first six months in 1885—Engagements, 754	"	$4,267,375
Showing a decrease for the first s x months in 1886 of—Engagements, 84	"	$780,742

In view of the fact that the preceding year was one of extraordinary activities, the falling off, as shown by present report, should not be considered discouraging; for the movements in building operations are fully up to the requirements of the times, and a greater rush would simply add to the number of houses to rent, which, while not numerous, are sufficient to suggest a little moderation for the present.

The demand for good draughtsmen during the month has been large, owing to the competition for the Court House and jail at Stockton, which required a large force to compile ten sets of plans for a single building, three-fourths of which labor was simply thrown away, not a farthing being paid for the services rendered, beyond the paltry sum of premiums, insufficient in amount to compensate for a single set of plans, even had one architect received the entire amount. But with the *divis* and expenses deducted, the actual balance to the premium parties will be but little, and the rest of the competitors, who were silly enough to waste their time in efforts to secure results not assured upon merit, can only console themselves with the glory of the attempt, and hold their conceptions as the reward of their folly, and be ready for the next move made by some Board of Supervisors to humbug ambitious aspirants into another farcical competition, which nine-tenths, if not forty-nine-fiftieths, of all general competitions are.

To Our Friends.

THE proposition announced in another part of this issue, offering to *dispose of our entire interest in this journal*, will be a surprise to very many of its readers, and, in view of the fact that *it is*, and *is recognized* as, one of the journalistic successes of the period, it will naturally lead to inquiry as to the reasons for the course proposed.

We answer: It is a conclusion most reluctantly reached; *but there is a period in human life when nature calls for relief from* EXCESSIVE *cares and labor; when ambitions should yield to the restful peace of contentment with that which has been accomplished.*

More than is meet for one to attempt, is not wise; nor can any one divide between two pursuits the time required for one, and do either well.

This we realize, and therefore propose to relinquish our editorial relationships, and devote ourselves exclusively to the duties of our profession as practicing architect, with the earnest hope and desire that those who succeed us may, in every way, be fitted and qualified for the responsible duties of directing and managing its future successfully, profitably, and alike creditably to themselves and to the class journal literature of the United States.

The multiplicity of personal engagements, and other drawbacks and interruptions in our editorial work, have imposed UNDUE and EXCESSIVE mental and physical labors, and prevented the utilization of the

NUMEROUS POSSIBILITIES OF THE SITUATION,

Which are practical, accessible, and important, and rightly manipulated, sufficient in themselves to furnish an almost exhaustless amount of matter and fact for future publication.

A change of management will also remove all the objections, prejudices, and jealousies more or less existing among architects, builders, and others, by reason of the fact of its being published by a *practicing architect*. For while it has been edited and conducted upon the broadest and most generous and liberal principles, consistent with its reputation as a representative journal, carefully avoiding and excluding all matter and references which could—in reason, without torture or forced construction of plain language, and a total disregard of fair interpretation of intended meanings—be charged as designed for personal, *professional benefit*, still there are those who claim to be able to trace the personal feature in every issue, from which they draw the conclusion and advocate the theory that a practicing architect in the chair editorial, no matter what the qualifications, is improperly seated.

We have realized and do realize the delicacy of our position in this regard, and have often restrained the free use of our pen in directions where to have done so would have been attributed to wrong motives on our part.

This restraint need not exist under a new administration, and we hope our successor will exercise his fullest liberty without fear or favor; for in California, of all other places, those who read journals of any class, like fire and force in the lines they read, eloquence simplified to the common understanding, and information and instruction plainly and clearly expressed.

AS AN INDIVIDUAL ENTERPRISE,

It offers strong inducements for investment, as, in the hands of right parties, it can be made

THE VERY BEST PAYING CLASS JOURNAL PUBLISHED WEST OF THE ROCKY MOUNTAINS.

And the fact is beyond all question, that a journal of its kind is an *absolute necessity in San Francisco*, to represent all interests in any manner pertaining to the architecture, erection, decoration, furnishing, and completion in every detail, of buildings of every class, together with all mechanical, laboring, manufacturing, and producing interests.

ITS PRESTIGE.

Occupying the field alone during the past eight years—the quarterly of 1879 included—has gained for it a

SUBSTANTIAL AND PERMANENT ADVANTAGE

Over all possible competition. And its most favorable recognition by the class journals of the United States and Europe has secured to it a widely spread popularity and prominence, which time, energy, and money alone could secure. The journal and

all its interests are entirely free and clear from all indebtedness and incumbrances.

Its future in the hands of an *incorporated company of architects and builders, collectively or separately, or of individuals seeking investment, with proper editorial and managerial appointments, can be made to yield a large return upon the sum required in its purchase and improvement;* particularly so, if, combined with the journal enterprise, there is a complete outfit and presses added for general and job printing, in addition to the journal work. We have thus far continued the printing, etc., of the journal by contract, but have frequently considered favorably the arrangement above suggested, and declined its adoption solely upon the ground that such a course would augment cares and responsibilities of which we have had more than we wish to continue in the journal work alone, in addition to our numerous architectural engagements and duties.

It is but seldom that an interest of so great value and assured prospects is offered for sale, but, feeling the twofold weight of professional and editorial responsibilities, it is a personal duty to ourselves to be content with the results of the former.

Redwood vs. Brick Foundations.

IN the "early days of California," redwood was considered to be a suitable and lasting material for foundation purposes, and was almost universally adopted. Many stories were related in regard to its durability, among which was one, that a certain post then (1851–52) standing in a "perfect state of preservation" at Santa Clara, had been planted by "the fathers, a hundred years ago." The general impression prevailed that redwood would last for all time, and nothing better was necessary for foundations, as a rule. But experience has demonstrated the fallacy of these first formed opinions, and shown that the redwood of California yields to the processes of decay when placed in the ground, varying only in rapidity of decomposition, according to the special characteristics of the earth, sand, or clay formation in which it is bedded, and the sapless quality of the wood itself. The black-heart redwood is far preferable to the softer, more puncky and fibrous wood, but for many years it has been difficult to obtain the better kind in quantities, without selecting and extra cost. So that while some of the earlier put in foundations, where the better quality of redwood was employed, have lasted well, the material generally used at the present time, and for a few years back, is from upland growth, and will not last one-half as long, particularly with the common practice of the day, not to spend any time in selecting the really good pieces, and rejecting the bad, but to "take it from the pile," using all that does not possess conspicuously bad defects; and contractors generally are not critical in their judgment on this score. When a load of lumber is sent to a building, the next most important question is its speedy consumption in the work of construction, which might be retarded if portions of the materials were set aside, and a delay occasioned until a substitution could be effected. So, generally the good and bad go in together, either and both of which answer all purposes to the fulfillment of the contract, and the matter of last and decay is left with the owner, as a matter to be attended to as after circumstances may develop.

The old wood foundations of very many buildings have been substituted by brick, and many more will have to be. Some very good structures rest on wood foundations, but the progress of decay and settling is such that changes are necessary. The removal of the poorer for the better and more durable is always expensive, and more or less damaging to the edifice. The difference between wood and brick is so small that no prudent man who is not pressed in circumstances is wise to build on wood foundations.

There are, however, in San Francisco, localities where either redwood or Oregon pine will last for generations, if not forever. Along the filled-in city front, where timber is bedded below the tide level, rot does not occur. Illustrations establishing this fact can be seen at the office of this journal, one of which is of Oregon pine, taken from the foundation of an old brick building which stood on the northeast corner of Battery and Sacramento Streets. It was placed in the ground in 1852, as planking under the walls of the building, and removed in 1875 for the erection of a new edifice. It is not only apparently as sound as ever, but exhibits signs of petrification, and perhaps would have maintained its soundness for a hundred years or more, if it did not by that time assume an everlasting character. Two other samples, one of redwood and another of Oregon pine, taken from the old bulkhead built on the line of Market Street, below First, on the property of Mark Sheldon, Esq., as nearly as can be ascertained, built in 1852, and removed in 1885, show no sign of decay. Each of these were, however, buried in the mud, at or below tide water. The fourth example, in contrast, is from a foundation renewed under a building erected on Sacramento Street, above Franklin. The house was built in 1874, and when re-underpined, in the latter part of 1878, the redwood taken out was more or less badly rotten, and, as may be seen by the sample, portions of the mudsills so thoroughly decomposed that chunks of it can be crumbled up in the hand like so much dry earth, scarcely sufficient fibrous tenacity remaining to resist the gentlest touch. From the foregoing, it is proper to advise that owners who desire substantial and lasting buildings should in all cases adopt brick, stone, or other indestructible material for foundations.

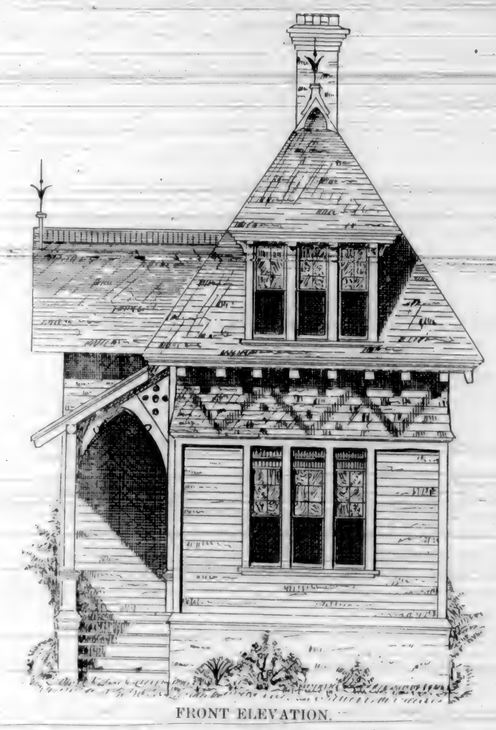
Interiors and Furniture.

EDITOR CALIFORNIA ARCHITECT: It certainly seems to me that persons who contemplate building homes for themselves will do well to consider thoroughly all of the points and features, present and prospective, before giving orders for their plans. Now, we all know that the general course pursued is to consult an architect, tell him what kind of a house is wanted, how much money is to be expended, and if these primary considerations are all satisfactory, the order is given to proceed with the plans. The house is finally erected, but as the total cost may have exceeded first expectations, economy becomes necessary in the fitting up of the interior, and the furniture and elaborations have to be curtailed. Now, it certainly seems to me that most people display a want of good taste and judgment in profuse exterior finishes, and exhaust their means in that which possesses no practical value as far as the real comforts of home are concerned, as compared with the pleasures to be derived from a due consideration of, and provisions for furniture and internal finishes. But few owners consider these points, or consult with their architects as to what furniture and finish will best suit certain rooms. This matter they reserve to themselves, and hence great inconsistencies exist in many fine edifices. Now, in my opinion, it is important that more attention should be paid to interior fittings and furniture. The greater portion of the leisure hours are spent with the family around the fireside, and therefore it is highly important that the surroundings should be pleasing, which cannot be when there is a lack of harmony in those things which the eye must see and the hands handle. The furniture and decorations should be suitable for the respective rooms. Among the first thoughts in connection with the building of a home should be the matter of furniture, so as to secure a final result satisfactory in every particular, which can be obtained by proper attention in the premises. Often the pleasure excited by exterior appearances receives a check upon the survey of the internal finishes and furniture. The confusions of styles, and absence of appropriateness, diminish the final admiration of all parts. The trims and finishes of the rooms may be in the Gothic style, but the furniture may be of no style, or a medley of all styles

—the chairs being, perhaps, Renaissance, the table no particular style, the mirror Grecian, the mantel Egyptian, and the carpet some gaudy thing without any particular appropriateness or design. Too much care cannot be exercised in these and all other particulars, so as to insure harmony and appropriateness. The matter of hardwood finishes is one which adds much to the comforts of home where there is an appreciation of the beautiful and elegant, while the extra cost to indulge in them, in certain rooms, is not so great as to preclude their use where absolute restriction in outlay does not exist.



FRONT ELEVATION.

But many men erect homes which they admire, but have no conception of the style of its architecture. The only thing clearly understood by them is, that the front door is the principal entrance to the building. But the effect of the interior finishes and furniture is a different thing. The commonest mind is enabled to distinguish between interior harmonies and distracted taste, or no taste at all. Consistency and harmony in these particulars enlarge and increase the pleasures of home; for where all the parts harmonize, pleasurable results follow, inspiring the sentiment, "there is no place like home."

It is not necessary to expend large amounts of money to accomplish the suggestions herein made. As a rule, furniture can be obtained made to order from original designs, at about the price that similar things would cost in any first-class establishment ready made, and it would certainly be more satisfactory.

A word or two on the subject of finishing may not be amiss. Take for instance the parlor. It should present a cheerful and pleasing appearance. The trim may be in some bright-colored wood, say butternut, prima vera or cherry, combined with black walnut; or, if preferred, make it all black walnut. The furniture should show quiet taste, simple in construction, but strongly made. If carvings are added they should be from natural subjects. In fact, a piece of furniture should be like a book—something from which to educate the mind. The carpets should be of quiet colors, harmonizing with the curtains and hangings. The hall, if laid in hard wood, say two inches wide, with a narrow carpet, presents a fine appearance; and if the hat-rack is placed in a recess, removes an obstacle which generally exists in halls; and if doors with cut or colored glass inclose the same, so much the better. A dining-room with floor of hard wood, either continuous lengths of narrow widths or in ornamental figures, would obviate the expense of carpets, except the cost of a rug in the center for the table, which, with neatly-paneled wainscoting, paneled ceiling, and trim of openings in butternut or oak, or other suitable hard wood, make a neat finish. The side-board should be built in a niche, and in my opinion should be a picture of the building and part of the room. The table should be of proper size, with the legs well under it, so that those sitting around it would not be required to hold a table leg between their knees.

Now, my reader, let me remark, that when you are ready to build, take the advice of your architect in reference to the interior finish and furniture of your building. When you are sick, you send for a physician. When you want to build, consult an architect; and in doing so, consult him in everything, for his studies and experiences qualify him to be your best adviser.

W. D. B.

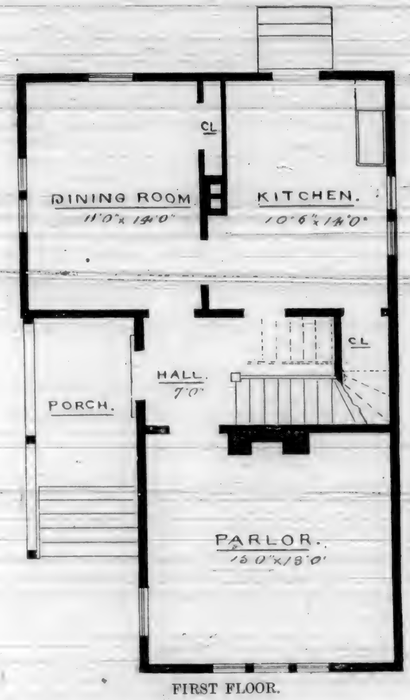
Honorable Emulations.

PRACTICED in the higher and more elevated senses, free from all the belittling influences of the human mind, they are proper and productive of good, and tend to higher developments, and greater and grander results to mankind. They are simply the result of mind upon mind, thought feeding thought, and he who produces the greater should honor the source from whence his thinking came. For the larger part of the brain, scientific and mechanical developments of the nineteenth century, derive their source of origination in something that has been suggested, produced, or expressed in ages gone by. There is scarcely anything of recent production which does not find its *thought inception* in the past; as the steam, with its ten thousand applications and uses, came to light through the humble teakettle, and the prolific brain of a boy. And those who have emulated and improved upon those first thoughts, are indebted to a very insignificant and humble origin.

The proudest achievements of the present day are largely the borrowed ideas of the past. Perhaps the origin in many cases may be very obscure, and their obscurity may almost obliterate identity, yet the germ has been planted in years or centuries gone by, and as still and quiet inspirations have come to men of later days, from inconceivable sources, their minds have enlarged and expanded into greater achievements, whether scientific, intellectual, or mechanical, commanding and receiving the admiration of the world. The world is a great school-house, and all men are scholars, some bright and apt to learn, while others are dull and slow, groping along in mediocracy and scaling down to the lower grades of humble life, and some sinking into the depths of vice and degradation. The apt scholars grasping, mastering, and perfecting the more difficult problems, bringing forth hidden treasures of mind and matter, and making the world wiser, brighter, and better. As the rains from the clouds descend to refresh, invigorate, and fructify the earth, causing the seed planted in the soil, the trees and flowers, to grow and mature, and produce other seed and fruit, so do good and bad, wise and unwise thoughts spread broadcast before the world give birth to other thoughts, similar in kind, and the fields of good and evil, advancement and retrogrades, are replenished and enlarged by the daily developments of life.

PERSPECTIVE SKETCH.

Personal glorifications too generally enter into results produced and laudations are poured upon those who have simply improved upon and perfected results, from the conceptions of some other and perhaps humbler minds to whom the birth right properly belonged. As Jacob, through his mother's device, secured to himself the birthright of Esau, so have thousands since that time secured to themselves credit and praise for results produced, which would not have been conceived or reached by them, had not the origin existed in other quarters. Still, honorable emulations are proper, and the world and society are improved and rendered wiser and better by the opening up of new, and the onward march of *improved thought*. And while present generations rejoice in their attainments over the past, they are furnishing ideas which will be emulated and improved upon in the future, by those who will hereafter perform their part in the great drama of life; and with increased learnings and experiences as age after age rolls on in the great volume of time, other and greater accessions will be made to the record of mind develop-



FIRST FLOOR.

ments, and one after another will appear on earth, simply to emulate, and still further improve upon the past and present, adding link to link, lengthening the great chain of human thought, results and developments, the ends of which will never meet, until human life shall cease, and the great family of mankind pass from earth.

REPORT OF COMMITTEE

APPOINTED BY

San Francisco Chapter, A. I. A.

TO CONSIDER AND REPORT UPON THE MATTER OF

PLAN COMPETITION

FOR THE PROPOSED

STOCKTON COURT HOUSE AND JAIL.

San Francisco, May 14, 1886.

To the officers and members of San Francisco Chapter, American Institute of Architects:—

YOUR committee to whom was referred for consideration and report, the matter of competitive plans invited by the Board of Supervisors of San Joaquin County, State of California, in connection with the erection of a public building to be located in the city of Stockton, and for the purposes of Court House and county jail, respectfully report and submit the following:—

That the invitation issued to architects by said Board to submit plans for said building, contains provisions and features recognized by the profession generally as objectionable, and subversive of all right rules which should govern in all such cases.

That the conditions and propositions are inequitable, and therefore unjust; that the sums proposed as awards are insufficient—the cost of the building considered—and not so apportioned as to be an inducement to qualified and competent men, to employ their time and professional skill in the preparation of plans; that the apparent arrangements are such as to invite and make possible the practice of manipulations, the like of which, in many well-known instances have wrought great injustice upon architects who have relied *wholly* and *only* upon the merits of their plans for success; that the retention by the Board of all plans receiving awards of premiums, should receive the unqualified condemnation of San Francisco Chapter, and all intelligent architects individually, as a suspicious means, through and by which great injustice may be, and in other cases have been accomplished, by the controlling powers selecting any one set of plans to receive the first premium, whether meritorious or otherwise; thus preparing the way for placing the work in the hands of preferred parties, and then in execution adopting in part or as a whole, either of the other premium plans, as the basis of construction; thus depriving their authors of the professional credit and financial profits which should accrue to them.

Such things are both supposable and possible, because known to have been so often repeated, that a large majority of qualified architects refuse to participate in any class of competitions; the fact being recognized in professional circles, that fair and just results are seldom meeted out to participants.

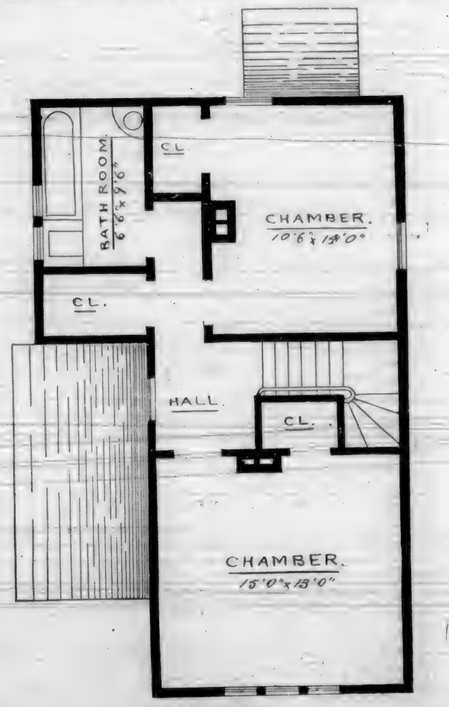
The propositions tacitly expressed, to terminate all architectural services with the adoption of plans, is unjust. If this is adhered to, then the all important and material work of details and construction must be entrusted to some favored party, who may or may not be competent. Whether this is intended as challanging the integrity of architects, or is provided to serve special purposes, it is a course which, if persisted in, must and will militate against the best interests of the commonwealth supplying the funds for construction. And if the proposition is not suggested in good faith, with full intent to carry the same into practical execution, then its present intimation is misleading and deceptive.

The Board certainly has erred in withholding the assurance of full architectural services and fee to the successful competitor. The right of an architect to furnish details, and supervise the construction of buildings planned by him, is one recognized and held throughout the profession, universal—as sacred. It cannot be questioned that the man who conceives and matures thought and study into practical illustrations on paper, is the better and only one fully qualified to exemplify such thoughts in practical execution. Plans are but outward expression of general ideas in tangible form—the germ of proportions and fitness lying in the development of the unexpressed thoughts, made complete through the harmonies and combinations in the details.

The need for the services of architects in planning important edifices, is universally conceded, in and by the fact that such services are sought in all such cases, as an indispensable requirement—Stockton not excepted; and so sought because of their value and materiality. Then why these studied efforts to withhold from those whose services and skill are admittedly so essential, fair, full and right compensation for services performed?

An important omission also appears in the entire absence of any provision for an impartial and intelligent arbitration of the merits of the respective plans. While this should be done by experienced and reliable men, fully qualified by practical, architectural and mechanical experiences—men entirely disinterested and free from all bias and personal or local interests or feelings,—such determination, and the rights and equities of the competing parties are left contingent upon the judgment, whims, and caprices of the honorable Board, and such influences as may be brought to bear.

It further appears that this is another of the numerous cases in which



SECOND FLOOR.

the attempt is being made to procure three sets of plans for a public building, at a price far below the rates of charges established by architectural societies, and the usages of the profession the civilized world over—for a single set—total cost of building considered; in addition to the large wastage of time and labor by those whose chances of any award is exceedingly remote and doubtful.

While it may not be, and confessedly is not within the province, power, or influence of San Francisco Chapter, nor any number of chapters combined, to define and dictate rules, regulations, and methods of procedures in matters of competition for any class of building, nor to prescribe and regulate conditions, fix rates of compensation, nor determine the rights and privileges that shall be held as binding in such cases, we may, as a Chapter, and as individual architects, express our hearty disapproval of practices and procedures which are calculated to be, and in numerous well-known instances have, been so prolific in impositions upon our fair and equitable rights, that the echoes of favoritism, tricks, schemes, plots, and manipulations are, and reasonably may be pre-supposed in every case where general competitions are invited.

The intimations outlined may appear comprehensive, and to some questionable; but the facts known in architectural circles are such that we feel warranted in the assumption, that the reasonable and possible proofs fully sustain all and more than is intimated in this report.

We further recommend that no member of this Chapter, nor any reputable practicing architect in this State, countenance or participate in the competition in question, nor any of like objectionable character that may hereafter be offered for general competition.

In conclusion, we claim that, as a Chapter, and as individual members of an honorable profession, we have just and honorable rights which should be respected by those desiring our professional service; that the intelligence, knowledge, skill, and proficiency enjoyed by all qualified architects, are the results of arduous study and earnest devotion to their high calling, and as a Chapter, and as individual members, we would not be just to ourselves to remain silent and permit infringements of our rights to pass without an expression of disapproval.

All of which is respectfully submitted.

JAMES E. WOLFE,
HENRY C. MACY,
GEORGE H. SANDERS,
WILLIAM CURLETT.
Committee.

The above report was unanimously adopted as expressive of the views and sentiments of the Chapter upon the subject matter involved in the report.

Art and Architecture.

[Special for this Journal. By F. Hillert, Architect and Mechanical Engineer.]

IN the first part of the present century, some architects at the time had the praiseworthy ambition—so far as the ambition went—to invent the sixth order of architecture; but it was simply recommended to them to study the orders existing, to study the principles of art and the laws of nature governing them.

This continent was settled by the Caucasian race of Europe. The southerly part was invaded and conquered by Spain, the conquerors having in the one hand the sword, in the other the emblems of Christianity. Judging from the constant strife and struggle, the Spanish conquerors were not able and rigorous enough to create out of the existing and destroyed civilization a new and better culture. The object of the conquerors was to gather from the conquered, treasures to be brought to the homes of the conquerors; they gave nothing in return. Christianity has not fulfilled its mission.

The northern part was peaceably settled by emigration from nations of the European countries, the emigrants bringing with them their customs, knowledge, culture, and unlimited energy, to make themselves here a new and happy home under the wings of liberty, social and religious, and a moderate climate, conditions required for a progressive, higher culture, if not retarded and stopped by political strife, interference and undisputed dishonesty.

The culture forming here had its beginning, its history, and tradition at the homes of the emigrant, and to there we must look and turn for information and assistance. So is it with art and architecture. The architect cannot invent a new style of architecture, unless he invents and applies a new building material, of a different cohesive structure than the one used in old and present times.

Art and architecture, to produce works of art, result from the collective exertions of all nations, from the very cradle of humanity. A true work of art will only be produced by genius, or by the application of rules on esthetics, reason formed from art work, and based on the laws of nature, and not by trying to produce something without that thought and phantasy have been exerted. The rule of thumb will not make a new style. Some works of pretension, appearing in execution and in print, show no symmetry and symmetrical equilibrium; do not bear out the stamp of purpose and utility. They are unnatural, and not truthful. They show really the want of knowledge of the beautiful, and of thought; and simply to criticise them in the spirit of art, would be doing injustice, unless it is known that the designer was in possession of the laws of the beautiful; when, being conscious of the same, he would and could not help using and applying them.

When architecture follows the dictations of popular fashions, of an unartistical taste and useless purpose, and imitating those vagaries and abnormities of an unhealthy imagination, over and over again, then this is a sign of a degenerated art time. When architects of some pretensions send off such work on the public, such artists have failed in their mission as instructors and cultivators of the public taste. Art, then, has failed to take its place in the general culture of mankind.

Modern architecture has no new style or types. It uses old perceptions, improving them in form and beauty, assisted in the execution of this work by a perfected mechanism and skill. Different is it with mechanical science, which in the last half century has made large strides in the progress, aided by the progressive sciences. To it society is indebted for the immense progress made in every branch of human activity.

I. UNALIENABLE DRIFT IN MEN FOR ACTIVITY.

The necessity of self-preservation compels man, even at the lowest state of culture, to express his wants and make an effort on the natural things surrounding him, to use them to satisfy his wants. The cravings of hunger compel the individual man to seek food to sustain his existence; the feeling of cold, to find shelter; these, and other wants and needs, compel him to exert his mental and bodily powers to provide against them. The first and primitive drift in man, is a deeply seated instinct for the exertion of his energies.

The result of his exertions on the outside world, and the benefits derived hereby, create in him not only satisfaction, but also the action itself. The feeling of his power, and the confidence in using the same, create pleasure and delight in him. He is urged from action to action; and therein rest in human beings an unalienable drift and impulse, the proof of which every leaf in history shows, and a glance in his own bosom proves.

II. THREE KINDS OF ACTIVITY.

In three kinds of activity, in which all human efforts range and concentrate, this natural drift shows and expresses itself, and obtains final results, which designate and mark the highest

possibilities of our feeling, actions, and thinking. As ideal, without which human being is impossible, and accordingly to it, are set up the ideas of liberty, immortality, and of God himself.

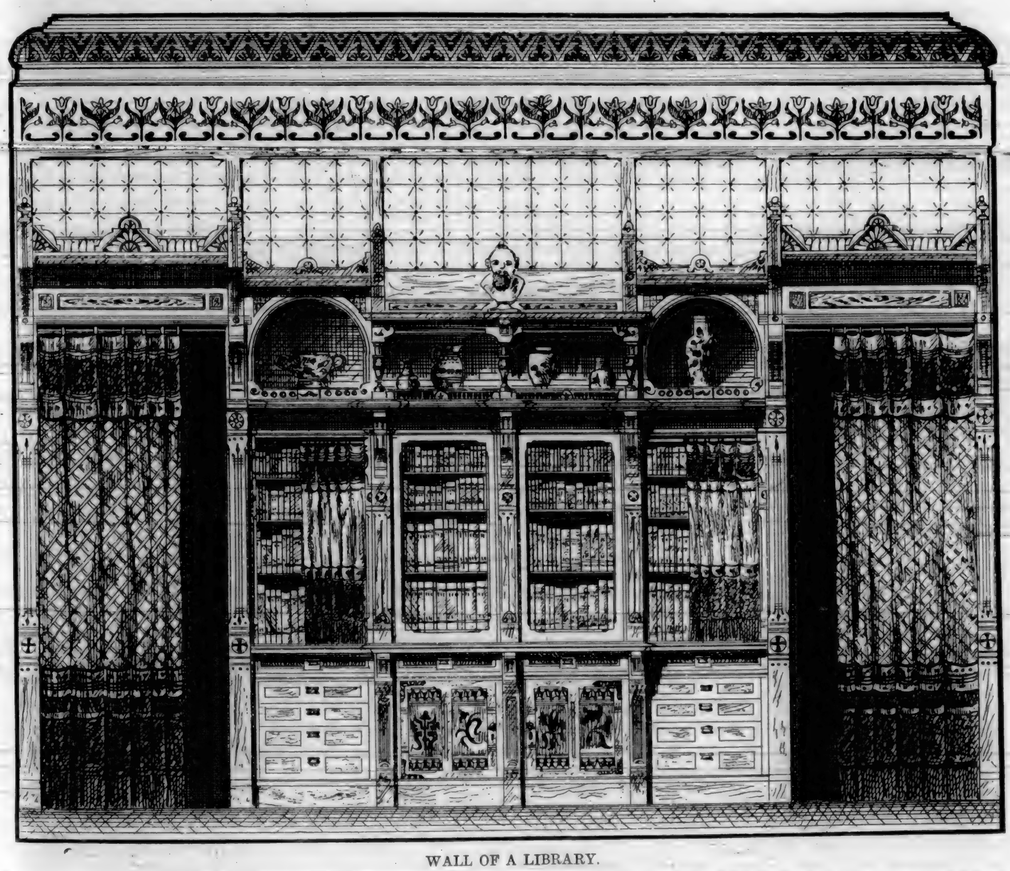
Liberty is the highest aim of our will, to which reason prescribes the laws of morality, without which, liberty is impossible. The idea of God leads to truth, then out of the conception of God, as the highest condition of the possibility of all, follows the perception of truth. The idea of immortality leads to beauty. Then the preservation of human products in their first original form, amid the constant changes of nature, gives us a presentiment of eternal duration, and we name, without prejudice to other definitions of beauty, the most perfect of such products, out of which, more than of others, the semblance of imperishability is shown, beauty.

The aims of all human efforts are, therefore, in intellectual respects, truth; in ethics, liberty, and in esthetics, beauty.

III. EXISTENCE OF THE SAME.

The natural instinct in its three different forms exists in every man, and shows itself with all nations, from the first and oldest traces of human culture up to our present day. The child's

question, "What is it," on seeing a strange object, is an expression of his inner instinct after truth. The struggle of a grown person with his bad instincts is nothing else but his effort for liberty; and the crippling of the feet of the Chinese woman is only the outcome of the instinct for beauty. Everywhere are perceptible the traces and the results of the activity of these impulses; here, in a known, clear practice; there, in an unknown, instinctive expression; here, in a uniform, systematic relation; there, in a sharp contrast of crude exaggeration and stupid neglect. With the India man the intellectual capacity is very small, the ethic laws deficient, and the esthetic creations, or forms, variegated exaggerations of an unclear phantasy. Harmony and accord predominated with the ancient Greeks. In the Middle Ages the intellectual stood back. Ethic and esthetic were shrouded and tied to positive, unremovable and fixed statuary laws and forms. In modern times these spheres balance each other more and more.



WALL OF A LIBRARY.

IV. PROGRESSIVE DEVELOPMENT OF THE SAME. FIRST, IN THE ETHIC DOMAIN.

Only those denying history will dispute progress, and deny the educational advance made by mankind in ethical respect, during the last thousand years. From barbaric custom and degrading slavery, men lifted themselves to a regulated form of state, and to nobler, finer sentiments. But neither the theocracy of the Jews in their supersensible doubtfulness, nor the democracy of the Greeks in their dissoluble development; neither the Jew's polygamy, nor the Greek's contempt of woman, designate a happy solution of the important part of the moral problem. Milder customs and perceptions were brought about and introduced by Christianity. But the sanctity of family, love of fellowship, and the pure moral laws, stood under an outside influence, not necessarily belonging to the spirit of Christianity, and gradually threatened to destroy the fruits of one and a half thousand years—threatened to make the priest a god. Our time created a clear way and put a stop by the secretions of the sick places; at least it tried, even if not everywhere with success; and open warfare exists yet between its spirit and the one of its predecessor. But only in conflict man tries his powers, and is the same decided, destiny will call on him again. But our time makes its moral law by the sentence, "Do good for the sake of good," which is comprehensible, and points hereby to the rapture consummated to the obedience of human fancy or to the dogmas of ecclesiastic by means of education to the belief of temporary or eternal punishment or blessedness.

V. IN THE INTELLECTUAL SPHERE.

The thoughts of men moved in an uninterrupted progressive education through centuries, even if the particular developing epochs were only of short duration and seldom returned. But in the time between them the attained culture acted quietly and powerfully, in making large strides onward, and preparing out of itself a new power, which again, together with the remnants of the old, started the same developing process over again. From the nearest outside things to begin, which thought men, as if it were, the spelling of thinking, he went over to other meditations on himself, inquiring after the laws of thinking and the boundary of his reason; he inquired after the connection of nature and the cause of all being—God.

VI. IN THE ESTHETIC SPHERE.

Not less is the same continuous succession to a continuous higher development in the esthetic sphere in existence. If we concentrate the exertions of the human intellectual drift in this direction in the widest sense, we comprehend hereby every change made on the objects nature has offered, and we will here unite all arrangements for the exterior living—all things that serve for the necessity, utility, convenience, education and the pleasure. It is evident that from the men of remote antiquity, living in forest and caverns, to the men living in wooden huts or

solid houses, the most influenced progress took place. Just so from this to the one which gave to the letter thousand tongues; to the wheel the speed of the wind; to the transmission of thought the speed of lightning. So on in general and the whole. A certain kind of things is between them, which we do not actually call necessary, useful, instructive, or agreeable, but which we call beautiful. These we separate and select from the many, to explore, investigate, and unite scientifically; and this is the problem of art history. To recognize their beauty and prominently the spirit of them, is the subject matter of the fine arts, or esthetic, in a limited sense.

The word esthetic means every observation made by our senses. In such an expansion it was used, setting in opposition esthetic and logic in relation to the sensible observation and reason. In the late new language, it is confined only to beautiful things, and we understand, in general, by esthetic, the science of the beautiful.

VII. CONTINUOUS PROGRESS IN ALL THREE SPHERES.

The progress in intellectual, ethic, and esthetic relation increases in an uninterrupted succession, notwithstanding the seeming retrogration and stagnation in the activity of man; and with his larger achievements grows his next problem, and so on; thus a never-resting process of development is uninterruptedly effected, being the result and consequence of preceding conditions and the necessary conditions of all later exertions. Then it seems as if at many times, many nations were at a complete standstill; that the development and progress of the human race was at rest. This was even only seemingly. Unobserved, here and there, are germs of culture formed, and at another place just at the same time important visible steps of progress are made. An illustration may be cited: the first centuries of our independent Christianity. They discarded the old culture, philosophy, forms of state, literature and art, and returned in thinking and forming to cruder customs, their ethic feeling inclined to supersensible fanaticism, and missed frequently the right position and relation to actual life. But notwithstanding this clearly visible retrogration, the most powerful progress was effected in the necessary fundamental principles, and later centuries proved that this time was of a far-reaching consequence, and its appearance was conditioned by the inner necessity.

VIII. COMMUNITY IN ALL THREE SPHERES.

The expression of the esthetic impulse in man is the first; then, before he is capable and in a position to think and to act morally, other objects impress on his mind, through his senses, and his necessary wants and requirements compel him to approach them direct, and unknowingly make them serviceable to himself. His first exertions are instinctively those of forming, moulding. From the simplest forms of formation, the club, broken from a tree, with which he killed an animal, men progressed continuously to make a multitude of well-formed instruments and tools, made well-arranged habitations, hereby above all assisted by the promethic gift of the fire. But now he began to act; the one was the master of the other; parents brought up their children; families united to larger communities; and, lastly, originated from many such families and communities a whole—a State—in which ruled a law made and sanctioned by all, or they were governed by the fancy of a chief. In the same time the unknown impulse led men to inquire of the cause of the nature surrounding him, and also of himself, and brought him to think of the same as of a divine spirit. So was religion formed. Inasmuch as not one has much truth, as imperfection and sham is in each, they are, nevertheless, the most important means of culture of the human race, and early man manifested the desire to make himself of that which he venerated as the highest cause, a picture or image, to give to his sensitive views a nutriment heretofore required. If now he venerated the fire, it was easily made; was it an animal, he shaped it as well as he could, or something similar; was it a higher developed spirit, he fell to the impossibility and adhered to the commands which the servants of this god, the ecclesiastics, proclaimed as his divine will. Fitting samples are the Brahman pictures of the India people, with their fantastic monstrosities. Liberal thinking outside of the ecclesiastic rules could alone be serviceable in this direction, and, consequently, art returned to the simple and natural. So with the Greek nation. When the human race has once outgrown its primitive condition, its impulses are rarified and refined from the instincts to the known, and are in a constant reciprocity, leading in a constant flow to a harmonious expression of all impulses together. The action must be forethought; the forming and shaping desired and wanted, and even thinking itself can only, by exercise, give sense to those of action and forming and made capable to turn to the abstract; then a purely contemplative condition towards nature cannot be thought of. In this large, general, and intensive reciprocity, men strive together for truth, liberty, and beauty, and try to perfect their beings in every direction.

(To be continued.)

The Average Life of Buildings.

"HOW long does it take for a city to re-build itself?" said the Building Inspector. "Well, that depends upon the progressiveness of the city. I should say about seventy-five years. That is the average life of a building now-a-days. There are very few houses in this city that were standing seventy-five years ago. The old houses on North Capitol Street, built by General Washington, are older than that, and there are other old buildings, but I am speaking of private houses. The buildings erected by the Government, under careful supervision and at great expense, of course, are more durable structures than those erected for private residences. The building which is being erected by Mr. Abell, on F Street, will cost more per foot, I suppose, than most Government buildings. No; it may not be a good investment, but it is not being put up as an investment; it is a monument. The new State, War, and Navy Department Building is, however, just as well built as that. That building will be standing a thousand years from now. It may, of course, need some repairs before that time, and the roof, of course, may have to be rebuilt. No material or work is allowed to go into that building unless it is up to the standard. The army engineers who have charge are very strict. Of course a private individual would not put up such a building. It would not pay. Yes; good brick ought to be as durable as stone. It depends a great deal upon the manner in which the bricks are laid. Good mortar becomes harder with age. It becomes harder than the brick itself. When dry bricks are laid during the warm months the bricks will absorb all the strength of the mortar. Brick laid at such a time ought to be wet. A wall erected in April or May, or October and November, of sufficient thickness, ought to last two or three centuries."—*Washington Star.*

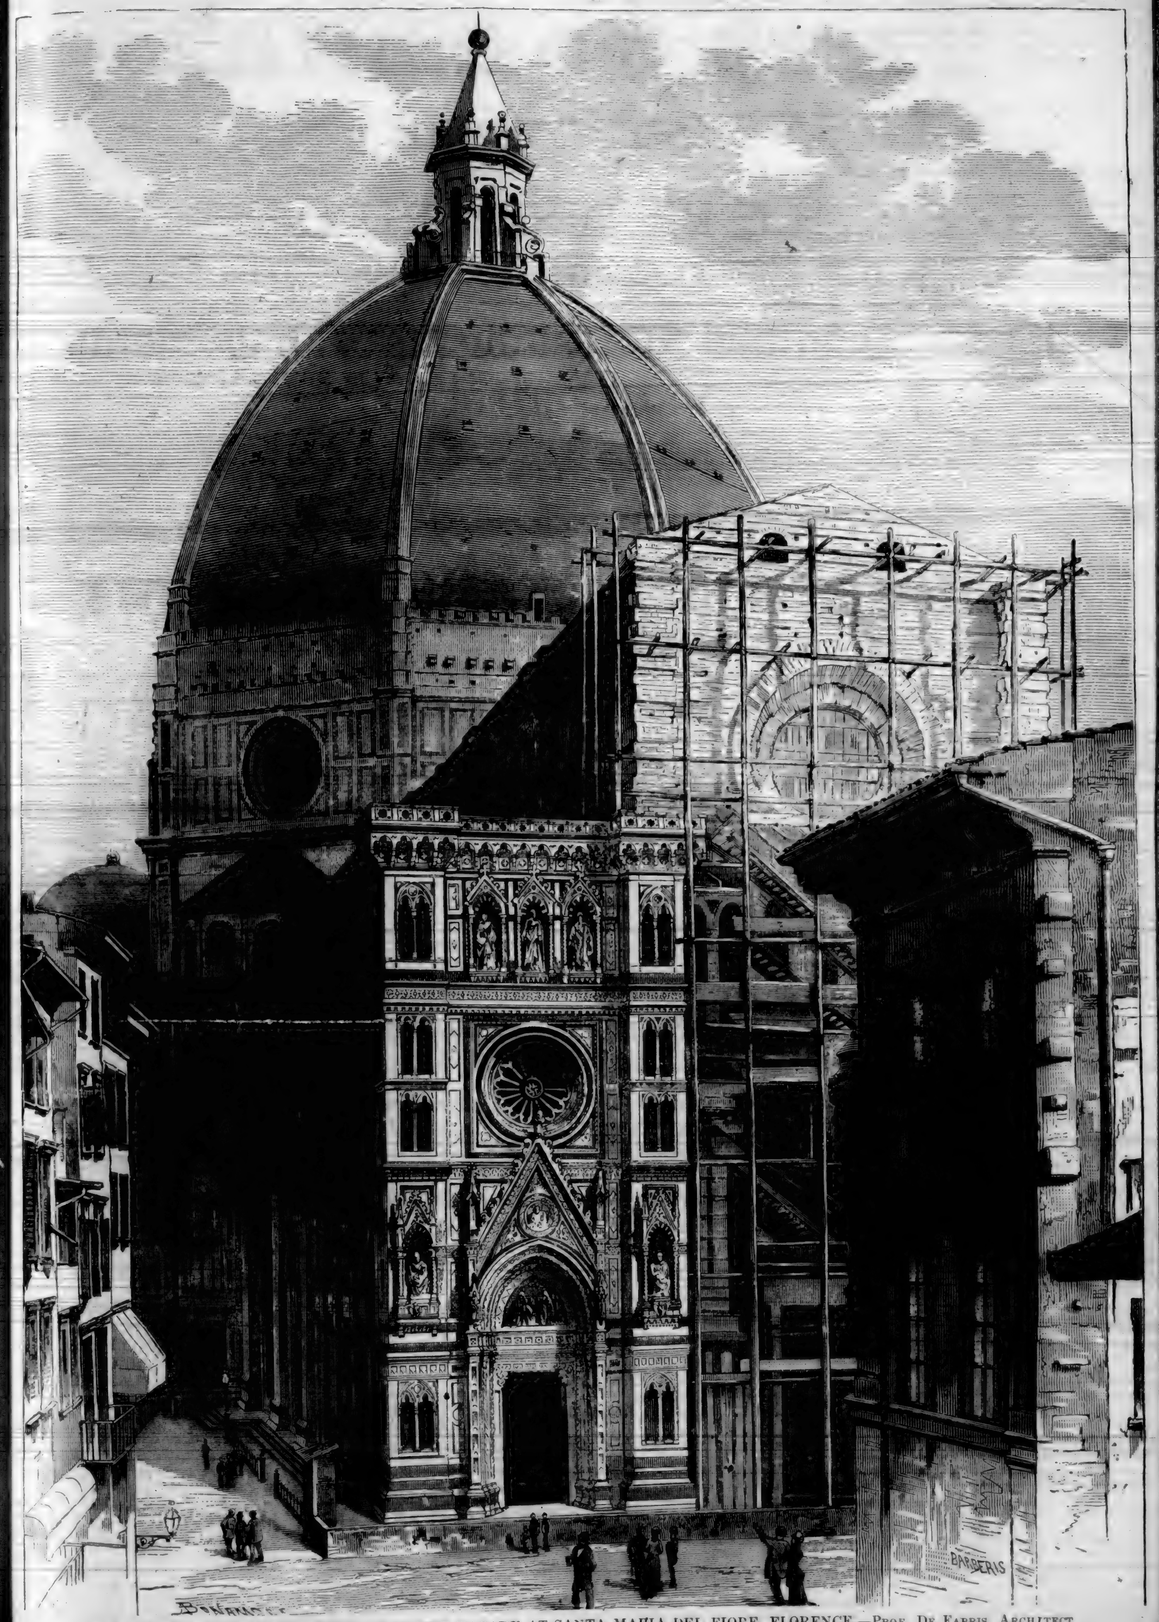
IN a recent editorial article entitled "Architectural Conservatism Indoors," the *British Architect* draws the following characteristics of English architecture:—

"We are, as a profession, too conservative, and too apt to reject a useful suggestion because it happens to be new and contrary to our preconceived notions of what is right according to recognized rules and practice. We think some of the fault of this conservatism can be traced to a lack of thorough education, and the consequent inability to found a correct judgment upon things practical and theoretical, which may not have been included in past experience. Then, again, we need a more liberal spirit of inquiry amongst us, and instead of using a material or an article merely because it is made by a particular firm, there should be some certain knowledge on the part of the architect that no better is in the market. And when a new suggestion is made, or a new invention brought out, which has a reasonable likelihood of being turned to practical account, it is as well to try how best it can be utilized, rather than to see how effectually we can put stumbling-blocks in the way of its adoption."

Much of which is, without doubt, equally true of our American architects.

ACCORDING to the *British Architect*, there is some talk of erecting the huge metallic tower invented by M. Eiffel, the mechanical engineer, on some convenient site within the precincts of the Paris Exhibition Buildings, and it is also satisfactory to know that a jury of experts will be impaneled to decide upon its structural safety prior to its erection. It will be 300 meters in height, and entirely constructed of iron. It will rest on five pillars, forming four immense arcades, lofty enough to exceed in height the towers of Notre Dame. On the summit of the tower will be erected an electric light-house, and a terrace to which visitors will be admitted. The form of the tower is specially adapted to give it stability in high winds. The oscillation at the top, under the influence of the most severe storm, will not exceed 75 centimeters. On a first platform, at a height of 70 meters, there will be a gallery of glass, which may be used as a café, or restaurant. A lift will take visitors to the summit. The expense of construction is estimated at from 5,000,000 to 5,500,000 francs.

THE elaboration of interior decoration with hard woods is increasing to a great extent in the cities, and dadoes of satin, maple, cherry, mahogany, etc., are freely used.



THE NEWLY-CONSTRUCTED PORTION OF THE FACADE AT SANTA MARIA DEL FIORE, FLORENCE.—PROF. DE FABRIS, ARCHITECT.

THIS JOURNAL

WITH ALL ITS INTERESTS,

WILL BE DISPOSED OF

TO

Parties Qualified to Assume Its Management and Control.

THE

California Architect & Building News

IS THE PIONEER JOURNAL

Published Within the Boundaries of the Pacific States of America,

IN THE INTERESTS OF

Architectural, Building, and Collateral Sciences,

AND THE

Manufacturing and Labor Arts and Interests.

Its publication as a Monthly was inaugurated during the dark and gloomy period of 1880 preceded by the Quarterly of 1879. And from the feeble beginning, which then lacked all the essential elements of journalistic experience, in addition to the absence of innumerable facilities requisite to its publication,

It Has Grown in Reputation and Influence,

Until It Is Now Recognized,

Throughout the United States and Europe,

AS THE

Representative and Leading Class Journal

Published West of the Rocky Mountains,

IN THE INTERESTS IT ADVOCATES.

The Following Notices, Selected from Scores of Like Character, Illustrate Its High Position and Standing in the Field of Class Journalism.

The CALIFORNIA ARCHITECT AND BUILDING NEWS is considerably enlarged and very much improved mechanically and editorially, which places it in the fore rank of class journals, where it belongs. It is a credit to this coast, and we take pleasure in perusing its clear and entertaining pages.—*Alameda Semi-Weekly Argus*, Jan. 23, 1886.

Another old friend, the CALIFORNIA ARCHITECT AND BUILDING NEWS, is greatly improved by its new form and style.—*American Architect*, Feb. 13, 1886.

The first number of the eighth volume of the CALIFORNIA ARCHITECT AND BUILDING NEWS appears in an enlarged form and new type. These signs of prosperity denote an appreciation of the journal by those in whose interests it is ably conducted.—*S. F. Chronicle*, Jan. 18, 1886.

The CALIFORNIA ARCHITECT AND BUILDING NEWS.—We find it one of the best architectural journals published, and, unlike some journals, it believes in justice to all, and upholds all legitimate efforts for the elevation of mankind, whether "professionals" or "laboring men." We wish it success and recommend it to our readers.—*Granite Cutters' Journal*, Philadelphia, Pa., Feb., 1886.

The CALIFORNIA ARCHITECT AND BUILDING NEWS has been enlarged and much improved. The number issued to-day would be a credit to any city.—*S. F. Daily Report*, Jan. 16, 1886.

The CALIFORNIA ARCHITECT AND BUILDING NEWS in its new dress and make-up renders it more acceptable than ever. It is always replete with valuable matter, and is ever an acceptable visitor.—*Alameda Encinal*, Feb. 3, 1886.

The CALIFORNIA ARCHITECT AND BUILDING NEWS appears in greatly improved and enlarged form. The current number, we think, is the best that has been issued. It shows wonderful improvement within the past two years. It is just such a journal as is needed for the Pacific Coast.—*Northwestern Farm and Dairyman*, Feb. 11, 1886.

The CALIFORNIA ARCHITECT AND BUILDING NEWS, enlarged and much improved in appearances. As to its contents, it has always been good. It is the best class paper that comes to our table, and we always find it worth perusal.—*Lakeport Democrat*, Feb. 20, 1886.

The CALIFORNIA ARCHITECT AND BUILDING NEWS appears in an enlarged form and new type. These signs of prosperity denote appreciation by those in whose interest it is ably conducted. It has a large circulation. We wish it success.—*Weekly Sun*, Jan. 23, 1886.

The CALIFORNIA ARCHITECT AND BUILDING NEWS is the leading architectural monthly of the Pacific Coast. Its articles are well written on important topics.—*Brooklyn Real Estate Review*.

The CALIFORNIA ARCHITECT AND BUILDING NEWS is the official organ of the association of architects, and is a fit representative of that interest. It should find a wide circulation.—*Petaluma Weekly Argus*, Jan. 23, 1886.

The CALIFORNIA ARCHITECT comes to us this month very much improved in every way—a decided credit to the Pacific Coast.—*Brick, Tile, and Pottery Gazette*, Jan., 1886.

The CALIFORNIA ARCHITECT AND BUILDING NEWS is a very useful and interesting publication. It is handsomely illustrated with designs for home and business buildings.—*Reno Evening Gazette*, Jan. 21, 1886.

The CALIFORNIA ARCHITECT AND BUILDING NEWS is a monthly journal devoted to architecture, building, decorating, and furnishing, and is the official organ of the Pacific Coast association of architects. In its enlarged form it is most admirable.—*New Age*, S. F., Jan. 21, 1886.

The CALIFORNIA ARCHITECT, in its enlarged and improved form, is a publication which will interest all who are connected with the building trade.—*News Letter*, Jan. 30, 1886.

The CALIFORNIA ARCHITECT AND BUILDING NEWS comes to us very much enlarged and improved. It holds its own remarkably well against the older Eastern journals of the same class.—*American Building Association News*, Chicago, Feb., 1886.

The CALIFORNIA ARCHITECT AND BUILDING NEWS is an invaluable periodical, not only to architects and contractors, but to house owners as well. It gives valuable plans for houses, and careful attention to drainage, ventilation, and sewerage.—*Daily San Jose Herald*, Feb. 3, 1886.

The CALIFORNIA ARCHITECT AND BUILDING NEWS comes to our table enlarged and materially improved. This enterprising journal, we are pleased to note, is keeping pace with the demand of a growing constituency.—*Northwestern Architect*, Feb., 1886.

ITS PUBLICATION IN SAN FRANCISCO,

DEVELOPED IN THE FULLNESS OF ITS POSSIBILITIES, is a universally accepted necessity; and under increased,

ENERGETIC, ENTERPRISING, AND COMPETENT MANAGEMENT,

Parties who can and will devote their TIME and TALENTS to the work, it is destined to become

A PEER IN AMERICAN CLASS JOURNALISM.

If from the adverse surroundings of its inception, with the many divided professional and other engagements and duties of its founder, it has been brought to its PRESENT, but by NO MEANS

ITS POSSIBLE STANDING AND REPUTATION,

What may it not become, with its interests and destinies under more Efficient, Diligent, Capable, and Scholarly Editorial and Managerial Control and Direction?

—:o:—

THE ARCHITECTURAL PROFESSION requires a Journal of its kind to represent its interests; to assist in sustaining unselfish and generous relationships; to advocate the right and expose wrongs wherever found in architectural circles, and assist in promoting fraternal ethics, and every right and reputable course calculated to elevate the honorable and worthy members of the profession far above the reach of reproach or disrepute, and, by all reasonable, right means, fix upon those who degrade and disgrace the profession, the mark of professional ignominy. In these directions this Journal has accomplished much, but more remains to be done.

CONTRACTORS AND BUILDERS of every class need it as a medium through and by which they may learn of every new fact and principle in mechanical science, and cultivate and develop into practice, those rules and methods best calculated to improve them as men and master mechanics—to furnish them with all current, local facts of interest, and give information from every city and town upon the Coast in reference to prospective works of public and private character.

TO MECHANICS AND WAGE-EARNERS it is a great necessity, as all men, high and low, learn and grow wiser by what they read, and the impressions made upon the senses by lines and figures representing ideas and conclusions of facts.

MANUFACTURERS AND PRODUCERS of building materials and devices of every kind need it as a means of communication with consumers.

THE COMMON INTERESTS OF THE STATE require it as a means of information at home and abroad, as to its unbounded resources in timber, building stone, marbles, iron, and numerous other valuable deposits and productions.

OWNERS OF PROPERTY require it as a channel through which they may be informed upon all matters relating to the erection of buildings.

CARPENTERS, MASONS, PLASTERERS, PLUMBERS, PAINTERS,

DECORATORS, FURNISHERS, AND ARTISANS GENERALLY,

Require it as a nucleus in and around which their interests may center, and through which each alike may derive special benefit.

Its Future is Full of Assurance and Promise.

With All Possibilities Wisely Utilized and Judiciously Handled, but which, from force of circumstances, have been to a large extent hitherto neglected, it may be more than doubled in every interest.

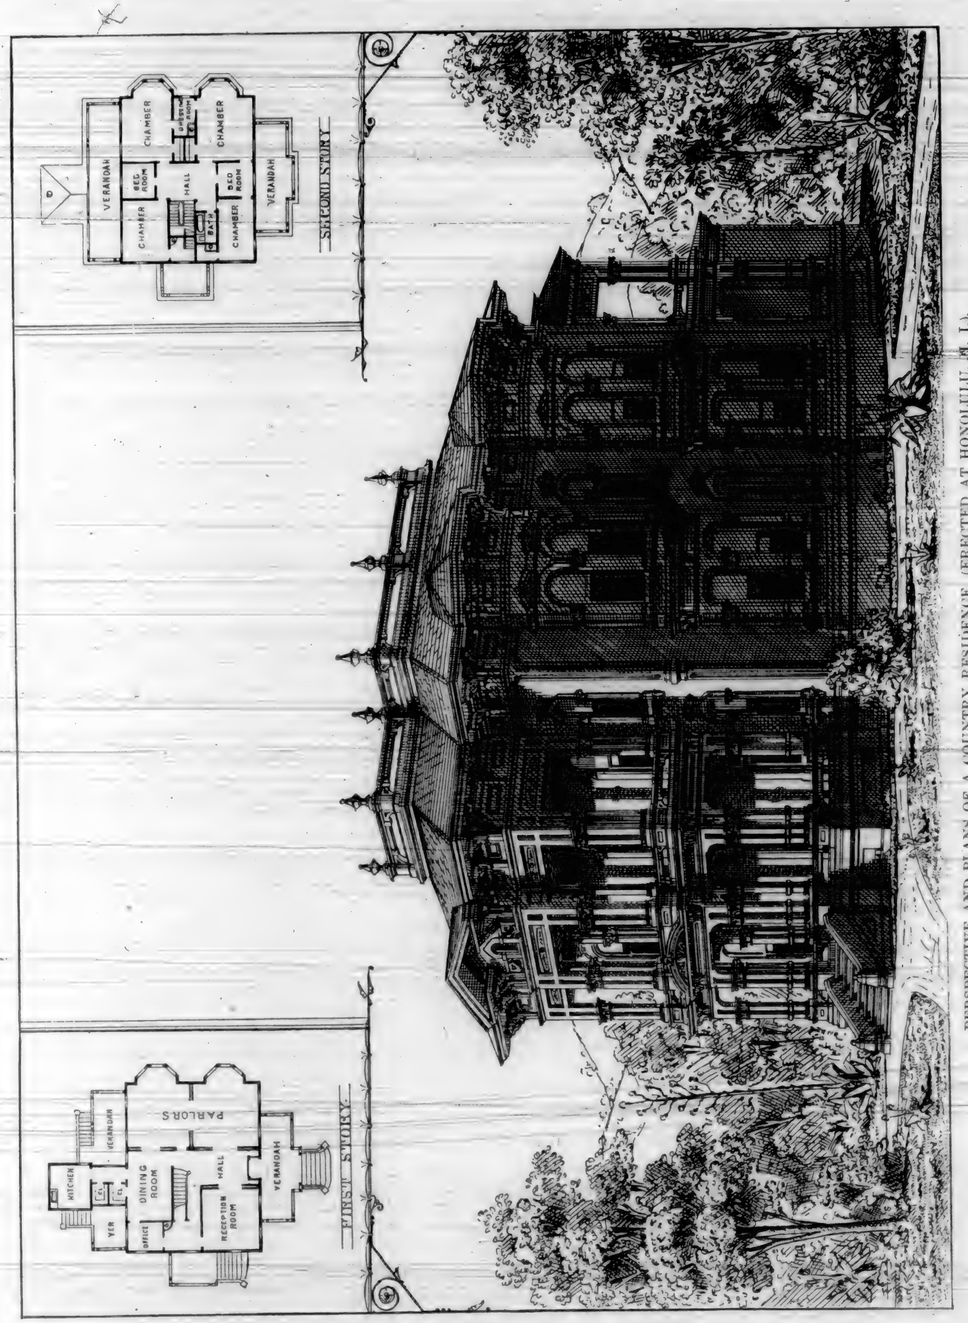
—:o:—

ITS ADVERTISING PATRONAGE.

But few Class Journals present better evidence of substantial prosperity and general favor than is shown by the advertising column of this Journal. Yet not one-half of what may be, has been reached. LOCAL ADVERTISEMENTS can be greatly increased and a large, neglected PATRONAGE FROM THE EASTERN STATES SECURED.

THIS PROPOSITION OF SALE

Is made to relieve ourselves from the excessive and double cares and responsibilities involved in editing a Class Journal and pursuing the responsible duties of practicing architect—to the latter of which we propose to devote our undivided attention, yielding control of the Journal, we hope, to more able and competent hands. We also hope its future will pass to some one of the manor born—some live Californian, familiar with all coast and local interests and requirements, either individually or in the form of an incorporated company. But if not this, then that some Good—Eastern, Western, Northern, or Southern—Man will enter the field with complete connections with all great centers of business and life, east, west, north, and south, and give not only to California, but to the people of the United States, Europe, and All Civilized Places on the Globe, a Journal of Peerless Merit.



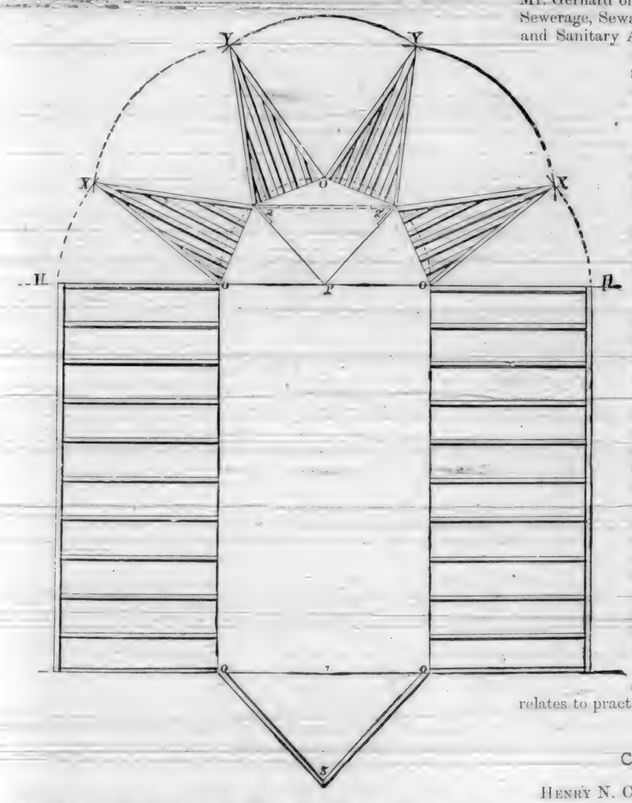
PERSPECTIVE AND PLANS OF A COUNTRY RESIDENCE (ERECTED AT HONOLULU, H. I.).

EDITOR CALIFORNIA ARCHITECT—*Dear Sir:*

As I have been frequently requested by some of the most able and competent master builders to give an easy rule for finding the cuts and covering of conical, hexagonal, and octagonal roofs, I offer the following, trusting it will be of service to them in laying out this kind of work.

The accompanying cut shows the timbers in position over ground plan. The method of obtaining this result is as follows: 0, 0, 0, 0, 0, 0, is the ground plan; 1, and 3, is the height of elevation. Make 1, 2, in ground plan, equal to the elevation, viz., 1, 3, after which connect 2, 2, in the ground plan, which will give the length of hip needed. Square out from O, H, right and left, indefinitely, then take the distance 2', 2 in the compass and stand in O, describing curve, cutting line squared from H, then cut at X, as shown; move compass to 2', and cut at X, and Y; move compass to O, and cut at Y, right and left; move compass to 2, and cut at Y, and X; move compass to O, and cut at X, and H. Thus obtaining the accurate length of all timbers, lay the jack rafters, or cripples, a suitable distance apart, and the problem is finished. To make a stand-up model, cut all around the outside, following the straight lines, viz., H, to O, to X, to 2', to Y, to O, to Y, to 2, to X, to O, to H. Now weaken on all the base lines, fold from you, and the model will show all timbers in their correct position. Yours truly,

M. J. MARION.



ARCHITECTS and sculptors will be much interested in the statements recently published in some of our foreign exchanges, that the long-lost quarries of valuable ancient marbles have been rediscovered. Among colored marbles employed by the Romans in their palaces and monuments some authors quote the Numidian marbles. But this name is misleading, for several quarries containing the genuine *giallo antico*, also a rose-hued marble, and a brown *breccio*, are located outside of the geographical limits of Numidia. One of these is situated east of Numidia, near Simmittu, in the Medscherdan Valley, along the railroad between Algiers and Tunis. The other quarry is said to have been discovered by a Mr. Delmonte, dealer in Carrara marble, and is described as being situated along a line of hills near the village of Kleber. Mr. Delmonte offers to deliver the marble in Oran, ready for shipping, at a price of 450 francs —90 dollars per cubic meter. The marble of this quarry, originally of a pure white color, has assumed an ivory tint due to presence of oxides of iron. There is also a pink variety, capable of being highly polished. Other varieties are also found, notably a yellow marble, similar to the *giallo antico*, a dark red marble, resembling the *rosso antico;* another variety called *pavonazzo*, on account of its resemblance to the colors of the feathers of a peacock. Some of the varieties of marble were used in the construction of the English church at Algiers. It is also rumored that a French geologist has discovered clues towards the finding in Upper Egypt of the Lucullan marble, a pure black variety, used in Roman architecture.—*Building.*

Book Notices.

"A PLEA for Sanitation in Factories and Workshops." By Wm. Paul Gerhard, Consulting engineer for Sanitary Works, 6 Astor Place, New York.

Author of the following works: "House Drainage and Sanitary Plumbing," Hints on the Drainage and Sewerage of Dwellings," "Diagram for Sewer Calculations," "Sanitary Questions," "Sanitary Drainage of Tenement Houses," "A Guide to Sanitary House Inspection," "Domestic Sanitary Appliances," etc. Mr. Gerhard offers professional advice on questions of Drainage, Sewerage, Sewage Disposal, Water Supply, Ventilation, Heating, and Sanitary Architecture. Plans and specifications also prepared for house drainage, and the sanitary arrangement of plumbing work. Correspondence solicited.

"BUILDERS' Work and the Building Trade." By Col. H. C. Seddon, R. E. Bound in cloth; price, $4.00. For sale by Jos. A. Hofman, 208 Montgomery Street, San Francisco, Cal.

This is an English work just published by the Rivingtons, of London, England, and makes a valuable addition to the two volumes, "Notes on Materials and Building Construction," published some time since by this firm.

This work has nearly 300 illustrations, showing nearly every style of brick and stone work, diagrams of constructive carpentry and joiner's work, tiling and slating, and a lot of other information pertaining to the building trades.

There is a very useful and practical chapter on bricklayers' work; also one on concrete and plastering; and some useful information is given on painting, coloring washes, and the tools used for cutting and rubbing for ornamental brick work. Very useful hints are also given for estimating the cost of all kinds of brick, stone, and concrete work. The methods of framing, in the chapter on carpenter's work, will be found very explanatory, as many illustrative diagrams have been given. The other trades appear to be thoroughly dealt with. There are several useful appendices, giving experiments upon concrete slabs, forms of specifications for concrete floors and roofs, and several valuable tables.

This work will undoubtedly take its place as a text-book of technical reference in all that relates to practical building operations.

Copp's Lists of Patented Mines.

HENRY N. COPP, the land and mining lawyer of Washington, has issued a book of 150 pages, which gives lists of about 10,000 mines patented by the United States up to January, 1886. These lists are arranged by States and Territories, and thereunder by counties and districts. It also gives instructions for the restoration of lost and obliterated corners of the public surveys.

This publication is an added evidence of Mr. Copp's industry, and will, without doubt, be in every mine owner's library. In it we observe the names of many of our wealthy and enterprising citizens. Parties contemplating the purchase of a mine can now readily determine if it has been patented. The purchase of unpatented mines is a risky business, as lawsuits are frequently purchased at the same time. The book sells for fifty cents, and can be had through the news dealers and of the publisher.

Publications Received.

THE May number of *Art and Decoration* contains fifty-four illustrations among which are pictures in the National Academy, two studio interiors in perspective, designs for stained glass window, suggestions for panel in lobby of theater, suggestions for *rapoussé* work, designs for tapestry painting, and twenty illustrations by Raguenet, with many short, interesting, and instructive articles pertaining to interior and exterior ornament. Subscription price, $2.50 per year. Single copies, 25 cents. Published by Art and Decoration Company, 7 Warren Street, New York.

THE May number of the *Inland Architect and Builder* is unusually attractive and valuable. The leading articles are reminiscences of the late architect, H. H. Richardson, who ranked at the head of his profession in the U. S., written by P. B. Wight, and a practical illustrated essay on Brickwork, by George Beaumont. Reports of the Nebraska State Convention of Architects and of the Cleveland meeting of the National Engineers' Society are given, besides building news from over one hundred Western cities. Among the illustrations are the new Court House at Madison, Wis., the West Chicago Club House, a design by Architect Beman for a Grant memorial, and several well-designed residences by prominent architects. Architects and others interested in building will find the *Inland Architect and Builder* profitable reading. Published by The Inland Publishing Co., Chicago. Subscription price, $3 a year.

THE *American Architect and Building News* (Gelatine Edition). The following is the table of contents for the May number:—

CONTENTS.—Mural Painting—Wood Architecture of the Northern Hartz—The Erection of Colossal Statues—Concrete Floors—Pile Driving—Communications—Notes and Clippings—Trade Surveys.

ILLUSTRATIONS.—Rood-screen in St. Peter's, Louvain—House at Ottawa, Canada (Gelatine Print, issued only with Imperial and Gelatine Editions)—Wood Architecture of the Northern Hartz, Germany—Court House, Clar on County, Pa.—House at Garrison on Hudson, N. Y.—Ancient Light-house, Island of Pharos—Modern Light-house, Island of Pharos.

Subscription for the Gelatine Edition, $7.00. Published by Ticknor & Co., 211 Tremont Street, Boston, Mass.

THE June number of *Mind in Nature*, discusses the question of "Mind in Animals," by Lady Murray-Aynsley, followed by notes on "Intelligence of the Elephant and the Orang." Doctor Valin continues his quest for the "Spiritual Evidences of Man's Descent," this time in the "Demon of Science." A. N. Waterman asks, "Is Spiritualism Only a Nervous Disease?" and F. A. Becher contributes "A Few Notes upon Mental Phenomena and Mathematics." Professor Thwing tells, "How to Induce the Trance." John Wetherbee reviews "The Spirits of Darkness." H. M. Hugunin describes an "Electrical Cloud Birth." Wm. Q. Judge in his remarks on, "Matters Touching Theosophy," replies to the discussion on "The Occult World" in former numbers of "Mind in Nature."

There are also extracts from Rev. T. T. Munger on "Truth," from Doctor Pettegrew, on "Faith as an Element in the Cure of Disease." "More Metaphysical Twins," is a report of several cases where persons were seemingly united in some psychical manner, that caused one to suffer the same mental or physical pains that disturbed the other, even though they were hundreds of miles apart. All those interested in the problem of "Mind in Nature," will find this little magazine well worth ten cents. COSMIC PUBLISHING COMPANY, 171 Washington Street, Chicago.

DECIDEDLY unique and original is the little cycling scrap-book just issued by the Pope Manufacturing Co., of Boston, Mass. Upon the covers are fac-similes of the covers or front pages of thirty-seven of the leading American publications, and inside are between two and three hundred newspaper and magazine clippings and quotations from prominent personages pertaining to the hygienic, business, and pleasurable advantages of cycling. By an arrangement of tint and type, the selections have the appearance of genuine pasted scraps, which makes the book worth possessing as a curiosity, as well as for the really valuable information it contains. The book will be sent upon request free by mail upon receipt of stamp, to any one interested in cycling.

COMPLAINTS are often made by those using iron saw-tables that the table becomes charged with electricity to such an extent as to be disagreeable. The table is undoubtedly charged by the friction of the belt. To prevent the table from becoming charged run a small copper wire from the leg of the table to a water, gas, or steam pipe. Anything that will carry off the current as fast as produced will do the work effectually.

The Building Interest of Woodland and Yolo County.

FOR THE SECOND QUARTER OF 1886.

EDITOR OF THE CALIFORNIA ARCHITECT: In comparison with the corresponding three months of 1885, the reader will readily see a decrease in the amount of capital invested this quarter, and as a ready conclusion infer that the building interest has taken a retrograde movement, and the following report is conclusive evidence. But when the true cause is considered, the effect is not serious nor depressing, but, to the contrary, is believed as an indication of prosperity.

The present outlook of the grain crop, the fruit of the orchard and vineyard, are, beyond a doubt, better and far more promising than ever before known in this county; therefore all are too much engaged in preparing for the coming harvest to look after building, which is considered of second importance, and the lull is only an index of better and more prosperous times in the near future; and with the coming fall it is anticipated that building in all its branches will be brisk, and there will be plenty of work.

CITY OF WOODLAND.

15 frames, value	$40,005
7 improvements, value	4,550
22 Total	$44,555

YOLO COUNTY.

22 frames, value	$35,150
4 improvements, value	1,600
26 Total	$36,750

Total for city and county, 48 buildings; value, $81,305. Number for corresponding months of 1885, 45 buildings; value, $120,600, presenting a decrease of $39,295. Accept our thanks for past favors and courtesies. Respectfully yours,

Woodland, June 4, 1886. GILBERT & SON.

The Building Interest.

SOME idea of the relative spread of the rapidly growing cities in the United States may be gathered from the following statistics of buildings erected during 1885:—

Philadelphia	5,937
St. Paul	3,451
Minneapolis	3,370
New York	3,368
Chicago	3,133

There were 7, 900 building permits issued in Philadelphia during the year. In the above computation, however, the only buildings included are 5,627 dwelling houses, and 310 other separate and substantial buildings for factories, stores, etc. Smaller structures, or additions to buildings already erected, are not included. It will be seen that Philadelphia is 2,500 buildings ahead of its foremost competitor. Twenty-five hundred buildings of this class furnish enough accommodation for a new city of 10,000 inhabitants.—*Iron Trade Review.*

Carpenters,

AND others interested in building: We call your attention to the advertisement of *Ives' Patent Sash, Lock, and Door Bolt*, on page XI. Mr. Ives offers to forward to any carpenter one *Ives' Patent Sash Lock* for ten cents in stamps to cover expense of mailing. These locks are undoubtedly the best we have seen, and we think it would be an advantage to all interested in building to send for one of these samples before selecting any other style, and see the advantages obtained by using the *Ives'* patent.

San Francisco Chapter of Architects.

OWING to death and sickness in the family of the Secretary, the usual postal notices were not mailed in proper season, and but few members received them until after the evening of the meeting. Consequently, there were so few in attendance that all business, and the discussion of the subject appointed for the evening, was deferred until the July meeting, reports in the daily papers to the contrary notwithstanding.

The San Rafael Unpleasantness.

WE have received several letters in reference to the school building at San Rafael, in which the position is assumed that the Chapter of Architects should take the matter in hand, as the name of one of its officers is, to some extent, mixed up in the affair, which, as far as the purchase of the school-house lot is concerned, has led to the resignation of the Board of Trustees and their arrest for bribery, etc., terminating in the suicide of one of the parties to the transaction—a man who, until the exposures in the case became a matter of public concern and notoriety, had maintained a good reputation for integrity and good citizenship.

As far as the architect in question is concerned, the reflections thrown out are wholly speculative and inferential, beyond the fact that the new Board have found, or claim to have found, the necessity for, and have advertised to "receive sealed bids for doing certain work in the new school-house on Fourth Street, in the town of San Rafael," etc., with all of which the Chapter certainly can have nothing to do, nor is it a part of the Chapter work to interfere in matters of the kind, unless the same is brought before it in some tangible form by the parties aggrieved.

Our Illustrations.

THE two sketches representing views in Chinatown are from life, and correct in every part, except that there is but one Chinaman represented for every twenty to be seen in the same locality from early morn till midnight. The front elevation, perspective, and plans of cottage are self-explanatory.

The perspective and plans for a residence are those of a building planned by us, and erected at Honolulu, H. I.

The remaining illustrations carry with them sufficient explanations.

HILL'S PATENT INSIDE SLIDING WINDOW BLINDS

Are Adapted to Any Style of Window

And Suitable for all Buildings, Dwellings, Stores, Office Buildings, and for Houses Built to Rent, Boarding or Lodging-Houses are Unexcelled.

THEY are entirely inside of the window casing, and while requiring no furring out or boxing, make it an impossibility to tear curtains, interfere with plants or window ornaments, or become broken by contact with chairs or other movable articles.

The light can be admitted and sunlight excluded from any part of the window; can be instantly removed and taken to any part of the house to clean, and as easily replaced.

They can be opened or closed with the window raised, and without removing articles from the window-sill, and cannot blow open or rattle. The Blind is very light (one-half inch in thickness) and strong, possessing more durable qualities than a hinged blind one inch in thickness.

There is NO SAGGING, BANGING, OR GETTING OUT OF ORDER!

They are made in three sections in height (each section sliding past the others), and any number of divisions in width corresponding to the folds in the old-fashioned folding blinds. They require NO HINGES—all trimmings furnished with blinds—are MADE OF ALL WOODS, finished or unfinished, and COST LESS than old-style folding blinds. They have been extensively used by the best architects and builders throughout the East and West, and have given perfect and entire satisfaction wherever introduced.

The following are a few of the owners who have adopted the HILL BLIND in preference to any other:

U. S. Government, four sets officers' quarters, Presidio Res., S. F.; H. F. Bruns, cor. Geary and Taylor, S. F.; J. C. Weir, Post, near Scott, S. F.; John MacKenzie, cor. Grove and Broderick, S. F.; L. H. Sweeney, San Rafael; R. B. Gray, cor. Pacific and Van Ness, S. F.; Raymond Hotel, 1,600 windows, Pasadena, Cal.

ENGLISH AND AMERICAN VENETIAN BLINDS

IMPROVED.

The only Perfect Venetian Blind in the market. For samples, prices and information, address,

EDWARD B. HINDES, Agent, 330 Pine St., Room 55.

Building Intelligence Facts.

ALTHOUGH there has been a great deal of complaining about dull times during the past month, the number and cost of buildings reported as commencements since our last issue, show that the work still goes bravely on, and that many owners of property are by no means inclined to allow their real estate to lie unimproved. This would not be the case were the indications not encouraging and promising. Those who buy or own building lots are, as a general thing, competent to judge correctly the advisability of planting more of their means in building improvements. And, further, such persons are generally cautious and calculating, and require good and sufficient evidence to induce them to invest, which they are not apt to do unless there exists at least fair assurances of satisfactory returns upon the money invested. Hence it may reasonably be inferred that the outlook is sound and prospectively good.

There is a permanent, healthy tone and under-current which stimulate many owners to active operations in building improvements, while others, who hold back, are strongly inclined to break away from the influences that restrain them, which state of facts assures of a continuation of activities. For those who "want to improve," and do not from trivial cause, will not long remain inactive, while others go ahead and reap the results of their greater confidence.

As will also be noticed by the report, many of the improvements are of the better class, and in the list of "flats," and houses for renting, the cost indicates good buildings generally. The labor agitation has had a somewhat retarding influence, as some owners are disposed to resent by withholding expenditures, when seeming arbitrary demands are imposed. But in the building trades in San Francisco, there have been no strikes among operatives calculated to unduly advance prices. The tendencies have rather been, among contractors, to under-value and underbid on work offered; so much so, that during the season the *pro rata* settlements have been numerous.

REPORT FOR JUNE.

79 frame buildings	cost,	$512,526
2 brick "	"	29,000
18 alterations and improvements	"	111,195
99, total of buildings	total "	$652,721

FOR SAME PERIOD IN 1885.

96 engagements at a total value of	$457,721
Showing a gain for 1886 of	195,311
And a gain on preceding month of 1886 of	251,182

Negotiations not Concluded.

THE announcement in its last issue, that the entire interests of this Journal could be purchased, has resulted in large numbers of inquiries and offers, but none as yet conclusive. The opinion that it is

"A SPLENDID PROPERTY,"

Has been freely expressed, but the query of personal qualification to edit and manage such a Journal seems to intervene. There has not been to us a single doubt expressed that, in right hands, it is the

BEST CLASS JOURNAL PLANT WEST OF CHICAGO;

Still, the "peculiar personal qualifications and fitness" called for seem to be a barrier, and a thousand suggestions have been volunteered as to the class of mind, intelligence and executive abilities required in its conduct, all of which we know from experience to be more or less imaginary and hypothetical; for when the present management began its publication, in 1879, it was without the slightest experience in connection with the publication business, and equally as little as editor and manager; besides which, at the time of its commencement, the building, financial and all other interests of the State, were encompassed and engulfed by the terrible state of depression brought about by sand-lotism, and the fearful gang of demagogues and panderers, to the worst and most wicked passions and fancies of the deluded and thoughtless crowds of unreasonable men, who were incited to clamor and hope for *Reform!* with the ultimatum of murder, arson and the annihilation of all "bloated bond holders," which included a large proportion of the successful and well-to-do citizens of this city. This state of things brought about a condition of approximate or absolute poverty and distress among mechanics and the working classes, and great financial contraction in all directions. Yet with all these

MOST TERRIBLE CONDITIONS,

Which passed away only by slow degrees as time rolled on, *this Journal worked and paid its way*, increasing in influence and public favor, until it has reached its present high position among the class journals of the country.

If, therefore, from a beginning unaccompanied by a single encouragement, other than a personal determination and purpose to brave the issue, so much has been accomplished, what we ask may not be anticipated for its future, with its foundations well and firmly laid and cemented, its superstructures all well proportioned, and its surroundings all of the most favorable character.

WHO SHOULD OWN AND CONTROL IT?

Many personal propositions have been made to purchase, by men seemingly well, if not in every respect qualified for its management, but who have not the financial resources.

The more general sentiment prevailing is, that it should be controlled by the architectural profession as a whole, or by *a syndicate of prominent architects*, to make it absolutely THE REPRESENTATIVE ARCHITECTURAL JOURNAL *of California and the entire Pacific States and Territories.*

Under such management and control, the splendid reputation it has already gained by the unaided efforts of a single individual, would be increased ten-fold.

At present there exist jealousies and prejudices, which would disappear, with the Journal under the general, interested management of a number of reputable architects.

If, as some now suppose and say, the present and past successes of the Journel are the results of the influence of one architect and his office, is it not then fair to presume that if twenty or more architects should concentrate their personal and office influence in its favor, its

FUTURE WOULD BE GRAND BEYOND COMPARISON.

Present management urged to continue. A large number of personal friends and patrons, among them many of our most prominent professional brethren, leading contractors, advertising patrons, and owners of real estate, have urged us to continue our publication labors, adding, "The Journal must be continued;" "It is a necessity on this coast;" "Such a Journal we must

have," etc., to all of which we have given the one reply stated in our first announcement, that we want and must have relief from the excessive cares, labors and responsibilities imposed by the triple duties of editing and managing the Journal, and as practicing architect,—a complication of more than any one individual can master successfully, without compromise of all personal comforts, and undue strain upon the mental and physical strength and energies.

Many well-informed parties have said to us during the past month, "We know of no one in San Francisco qualified to assume its charge." This may be true as far as individual knowledge is concerned, but it is not so as a general fact. There are, beyond question, in this city,

HUNDREDS OF COMPETENT MEN

Who, if not familiar with all the details of monthly publications, are sufficiently qualified to master the situation within sixty days, during which time the assistance that will be given by the present management, will perfect them in the entire work.

If it passes to parties who are not practical architects, it will gain instead of

LOSING ARCHITECTURAL FAVOR,

As such a change will secure patronage in directions at present inimical to its success; and influences now opposed to it among mechanics will change to support, and so give it additional strength and prosperity.

The many offers thus far received are held contingent upon those that may follow. As we are not in haste to make the change, we shall deliberate thoughtfully upon each proposition submitted, hoping that when a change is made, it will be such as to place the Journal in right hands, and thus make its future an assured success for all time.

Appropriate Souvenir.

MR. JAMES E. WOLFE—*Dear Sir:* In laying the cornerstone for the new Methodist Episcopal Church South, of Woodland, on the 10th inst., we took the liberty to present to the officers of the church the last number of the CALIFORNIA ARCHITECT, with your regards, which was accepted with thanks, and the volume placed in the casket with many other valuable articles, and the casket was sealed and deposited in the cornerstone of the edifice, there to remain until some future generation may, perchance, open it and again unvail to the world that *May number of 1886*, from its long and peaceful rest, and those columns you have so earnestly and ably furnished will be perused by many an ardent observer, who will carefully scan the record of the past and mark the infinite diversity of human aims in this short-lived struggle of dependent humanity. Let us work and work well, while the day lasts, and be ready when the great Architect of the universe has need for us, and hope that our bodies may rest as secure and peaceful as the volume in the corner-stone, while our spirits and good influence will ever on.

Respectfully yours,

GILBERT & SON.

Woodland, June 14, 1886.

Press Excursion.

THE annual excursion of the Press Association will take place this month. The members, in a special train over the C. P. R. R., will leave this city on the 19th, and will visit Reno, Truckee, Lake Tahoe, Carson, Virginia City, and other points of interest. As press of business will prevent a personal inspection of the country in regard to building news, we have secured the services (kindly volunteered) of a brother editor, and will report in this Journal the state of building activities as they exist over the line traversed by the excursionists.

ALL law-abiding citizens regret the late terrible scenes of riot and bloodshed in Chicago, caused by the misguided anarchists, and every true American citizen, whether native or adopted, is ready to advise that they be stamped out, and to assist, if necessary, in doing it. But that riot has been of value to the trade organizations of the country in showing the public the great difference between the anarchists and organized labor, officered by men who are outspoken upholders of law and order, and who seek to hold in check the vast heterogeneous mass comprising their assemblies. They counsel peace, moderation, arbitration, and when very serious grievances appear they are ready to say to employers, "Come, let us reason together."

A bound volume of this Journal, for either of the years. 1880, 1881, or 1882, will be sent free to all new subscribers for balance of this year and 1887.

Twenty-first Industrial Exhibition of the Mechanics' Institute.

THE annual exhibition of the Mechanics' Institute will be opened in this city on Monday, August 16. Its general character will be similar to that of its predecessors. The Directors have separated the exhibits into two classes, viz., those that are entered for exhibition, and those for competition. If the latter, they must be in position, and receipted for, on or before August 26. If not entered by that time, under no circumstances will such articles be allowed in competition, except with the written consent of all the contesting exhibitors, and the sanction of the Board of Trustees.

The following extract from the Rules and Regulations will be of benefit to those desiring to enter articles for either exhibition or competition:—

The award of a gold medal for best general display will debar any article in the same from competing for any other premium.

Space applied for and not occupied by August 21, may be assigned to other exhibitors.

No articles will be allowed in the Exhibition of an explosive, inflammable, dangerous, or offensive character.

No nostrums allowed in the building.

Articles must remain on exhibition until the close of the Fair.

All exhibitors will be required to keep the space under their control clean, and in good order. All coverings over goods to be removed before 11 A. M.

The greatest care and vigilance will be exercised by the managers, and the most effectual means taken, through the agency of the police and otherwise, to effectually guard and protect the property on exhibition; but under no circumstances will the Mechanics' Institute, or the managers of the Fair, be responsible for any loss or injury to articles placed on exhibition. *The owner must take all risks.*

The list of articles in the premium list is divided into forty-seven classes. The prizes consist of gold, silver, and bronze medals, and diplomas. Coin prizes will be given in the various classes as follows:—

Horticulture and Farm Products. In the former class the first, second, third, and fourth prizes are, respectively, $75.00, $60.00, $40.00, and $25.00. In addition, special prizes will be awarded to best display of flowers from private gardens. Premiums in this class will be a medal and coin, the latter being in amount, $15.00, $10.00, and $5.00, according to merit.

The largest premium to be given is in Class 47, Farm Products, viz.: For the best, most extensive, and varied exhibit of farm products (exclusive of live stock) by any county in the State, Gold Medal and $250; second best display, Grand Silver Medal and $150; third best display, Silver Medal and $100; fourth best display, Bronze Medal and $75.00.

All articles entered under the headings, Fruit, Dried Fruits, Nuts, Canned and Preserved Fruits, Vegetables, Dairy Products, Honey, Meats, etc., Wools and Cottons, will be subject to competition for medals or diplomas, and a monetary prize, ranging in value from $75.00 to $5.00.

The Directors have been very earnest in their endeavors to include in the different classes all articles liable to be placed on exhibition, but should anything be entered not included in the list, they have reserved the right to declare the exhibitor entitled to a special prize.

We sincerely hope that the Directors will take measures to illustrate to their patrons the *practical* workings of technical schools. This can be readily done, and perhaps be the means of inducing some of our moneyed men to encourage the establishment of such schools in many different portions of the State.

As an inducement to increase their membership, the Directors wisely adopted a rule by which each and every one belonging to the Institute can purchase a season ticket to the Fair at one-half the usual rates.

Risk of Contractors.

ONE of the most serious risks which building contractors incur and yet one which many of them habitually overlook till a costly damage suit opens their eyes, is the civil responsibility of an employer for injuries suffered by his employes while in his service. A recent suit in Paris, reported in *La Semaine des Constructeurs*, is instructive as showing the tendency of French courts to hold contractors to increased responsibility for their workmen. A mason employed in the erection of a building in Paris was struck on the head and instantly killed by a large piece of iron, which was accidentally dislodged from an upper floor directly over where the mason was at work. His widow sued the contractor for twelve thousand francs damages. It was held to be a contractor's duty diligently to care for the safety of his men by all reasonable means, to warn them of the dangers attending their employment in various locations, and to furnish adequate protection where possible. In this case, the contractor, failing to do this or even to warn the man of his danger, was responsible for the fatal accident, which a little more care on his part might have prevented. The editor remarks, in comment, that the tendency of the French courts is to increase severity in estimating the responsibilities of employers for the safety of their workmen, and cites another case where it was explicitly held that contractors are bound "to care for the safety of their men, and to protect them from the dangers incident to their work;" that "under penalty" they must anticipate "possible causes of accident," and take, and cause to be taken by their agents, all necessary precautions to prevent or avert them; that "they are bound even to guard the workmen against the consequences of their own imprudence." The general rule of the French courts is, further, to acquit the employer of responsibility only where "the imprudence of the victim has been the sole cause of the accident." This looks severe, but we should hesitate to say it is not in strict accord with the dictates of a sound public policy, as well as of humanity. It would certainly be well for American contractors to lay it to heart, as a measure of their moral, if not legal, responsibility.

In connection with the rigid rulings of the French courts, it may be well to note the tendency of English law on the same subject. A recent case, that of Griffiths against the St. Katherine's Dock Co. of London, reported in the *Building and Engineering Times*, furnishes an illustration. The plaintiff was injured by the fall of an iron door, which had been in an unsafe condition for a long time previous to the accident, and this fact was well known to the defendant company, as was proved and admitted on the trial. The court held that this alone was not sufficient to make the company answerable in damages, that it was necessary further to prove that this danger was unknown to the plaintiff, up to the time of the injury. The general principle was laid down that, "if a servant enters or continues in an employ, knowing of the danger incident thereto, he cannot recover, since he might have escaped by leaving the service." It may be well, perhaps, to admonish some classes of employes, that if they continue in dangerous work, they do so at their own risk; but it is not difficult to imagine cases where the peculiar nature of the business or of the workman's position is such that he is practically unable to leave his employment, though he knows it to be dangerous. In overcrowded London, a man who should throw up one place might suffer much privation before he could get another, and the new place might prove yet more dangerous than the old, and farther from his home and in many other ways less desirable. But it is difficult to imagine a reason other than criminal negligence, why a corporation should knowingly permit the premises occupied by its workmen to be in an unsafe condition and remain so; and the law which relieves a corporation of responsibility for accidents which happen to its men through such willful neglect to repair its own premises, on the heartless excuse that the injured men knew of the danger, looks more like a temptation to manslaughter than anything else. We trust it will not be considered an authoritative precedent for American courts.—*The Inland Architect and Builder.*

Farm and Fireside of April 1 gives some interesting figures showing how the mechanics of Springfield, Ohio, are kept in poverty. It cites two cases of losses, the first being a loss of $25,000 a year on coal. "The retail price of coal in Springfield has been a dollar a ton higher than in Columbus, the difference in price being more than double the difference in cost of hauling." The five thousand families will burn during the year not less than fifty thousand tons of coal, on which they have been wrongfully taxed more than a half dollar a ton, or $25,000 per annum, which might have been saved by uniting in the purchase of coal. The other loss is one that comes through rum. Springfield maintains 175 saloons, and the estimate is made that the 25,000 inhabitants expend $350,000 annually, which enormous sum is mainly drawn from the pockets of laboring men.

THE first Bessemer steel converted in the South was made at Chattanooga, Tenn., on April 19, by the South Tredegar works. The experimental cast of two gross tons proved excellent steel under all tests applied. The material used was pig-iron from Cranberry ores, North Carolina, and shows that ore to be excellent steel material. The plant has a capacity of eighty-five tons per day. The success has caused much gratification among Southern iron-masters.

A bound volume of this Journal, for either of the years. 1880, 1881, or 1882, will be sent free to all new subscribers for balance of this year and 1887.

Building Permits.

AS we understand it, in nearly all the Eastern cities, laws or ordinances exist, requiring the obtainment of building permits in *all cases* of the erection of new or remodeling of old buildings. Such a regulation is good, and should be in practice everywhere, as it would regulate procedures and prevent many of the difficulties which so often arise in San Francisco, particularly in connection with the alteration of buildings within the fire limits. At present, there are ordinances requiring permits to open streets, for the putting in of sewers, etc., on which a deposit of twenty dollars is required, to insure the proper replacing of the street, and also permits to occupy a certain portion of the street during the erection of buildings, building areas, etc., in certain parts of the city, at least. If this permit rule was general and imperative in all cases, it would furnish an easy method of ascertaining the extent of building improvements made during the year. As it is now, everybody does and acts as he pleases, and there is no check upon irregularities. There should be a compulsory and imperative law upon this point. It would be an easy matter for an owner, architect, or builder, to report every improvement entered into, and obtain a permit; and a penalty should attach to every violation of the rule. The do-as-you-please practice is all well enough in most matters, but there are others in which individual rights and privileges should be made to subserve public interests. No harm could possibly result from such a regulation, while the general information afforded by it would be at least gratifying to every one interested in the growth and improvement of the city. Speculative estimates are often indulged in as to the amount of work under way at certain periods, often varying materially from actual facts. The permit system would remedy this, and furnish daily statistics of what was being done in the building line. Excessive or diminished estimates of business conditions sometimes do harm, and the degree of business prosperity is often misrepresented, leading to wrong conclusions. In cases of death, and in other matters, obligatory ordinances compel notices of the occurrences, because the public good seems to demand it, and the growth and prosperity of the city is a matter in which all citizens are interested, and in reference to which they have a right to be informed, which would be the case if a perfect permit system was established; one which could not be ridden over with impunity, as too many of the regulations on the ordinance book are.

THE modern improvements of the past few years have received great favor and general adoption in nearly all classes of buildings—but practically in the better kind. But with the convenience afforded by them, they have been the medium of a vast amount of sickness, suffering, and *loss of life*,—not of necessity, but because too great neglect and carelessness have been practiced in their application, and too much indifference to *serious consequences*. The modern improvements as a general thing are good, but the best invention in the world may be rendered worthless, or injurious by being tampered with by unskillful hands. There are hundreds of *pretending* mechanics, to whom it would be unwise to intrust anything requiring good judgment and practical mechanical skill, and the greater number of defects and failures in connection with the introduction of these improvements, grow out of this one cause or fact. There is no good reason why wash basins, etc., may not be set in any chamber or place, with perfect freedom and security from all bad effects, yet there are *hundreds of ladies* who object to their introduction, because of known cases where they have proved offensive,—while in fact, the whole difficulty exists in the incompetency of the superintending party, or the mechanic doing the work, and not in the thing objected to.

Circumstances.

THAT circumstances have a great deal to do in shaping a man's life, no one can deny; for experience teaches us, and observation and historical research prove it so.

Shakespeare says, "There is a divinity [or something else] which shapes our ends, roughhew them as we will." There is no absolute dictation or iron-bound fatality in this quotation, but rather the opposite. While we would not ignore the existence of a divine power in the universe, in whose hands, and under whose control are all things in heaven and earth, while there is at times some circumstances over which man has no control, still there is nothing in these two facts which in any way hinder man from being successful and happy if he observes well the laws of his being and the laws that govern and control the movements of ordinary life.

We are not, by any means, mere living and breathing human machines, but, on the contrary, we are free, responsible agents, gifted with the power of choice, and capable of discovering right from wrong, and with full liberty to do what we will, and be what we may.

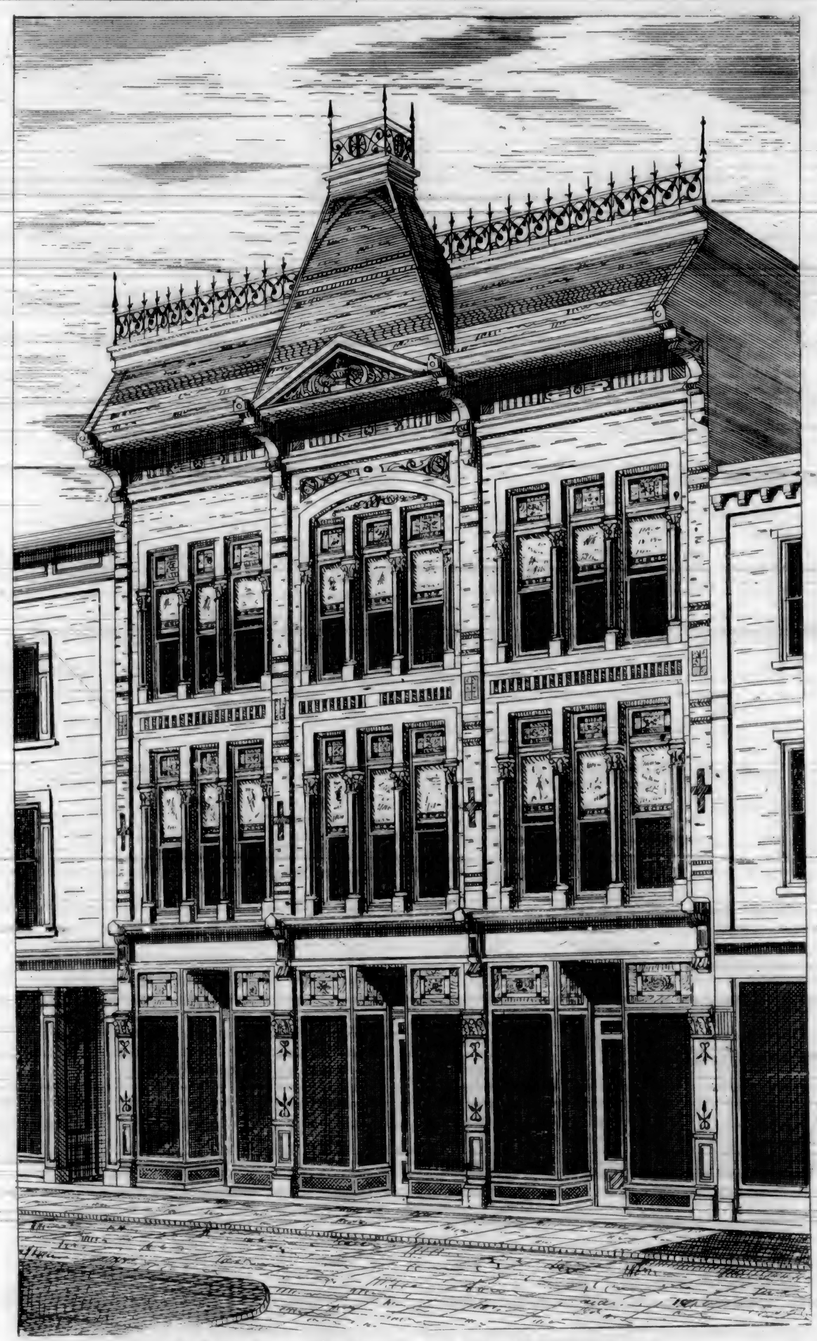

PLATE 1.—FRONT ELEVATION FOR A MERCANTILE EDIFICE.

S. F. Chapter of Architects.

THE regular night for the meeting of the Chapter occurring this month on the eve of the holiday, the attendance was limited to but a few members. The time was, however, profitably spent in general conversation and discussion of topics of interest to the profession. The reading of papers by Mr. Sanders was postponed until next month, when it is hoped there will be a full attendance.

Ash, oak, walnut, etc., must step down and out before many years, and give place to mahogany, which is now used for insides and for ornamental work on railway coaches; 10,000,000 feet of mahogany annually is now the figure, as against 500,000 feet five years ago. It is said that the mahogany is now but slightly dearer than our native woods—walnut and cherry—but that it is superior to them, in that it does not warp nor check.

Eight-Hour Movement.

THE full strength of the eight hour movement at the end of the first week after May 1, the date of its attempted inauguration, was clearly shown by statistics published. The total number of workmen committed to it in all parts of the country was estimated by *Bradstreet's* at 325,000. The demand for shorter hours was early conceded to 150,000 without a strike, and to 356,000 as the result of the strike, leaving 140,000 still striking at the time referred to, or defeated. The trades in which the movement was most successful are those connected with house building, agricultural implement making, furniture making and machine building. These trades are not subject to foreign competition. In those which are subject to such competition, either in the way of exportation of the domestic product or importation of the foreign, the movement met with very little success. The whole movement may be regarded as experimental. In those branches of industry which yield sufficient profit to warrant an increase of wages, for that is what shorter time most commonly signifies, the increase has been very generally granted. In others it has not been granted, or, if granted, it will be withdrawn later. The principal part of the loss entailed by such an experiment proceeds from the stoppage of machinery. This machinery may be of the nature of general business superintendence, clerical force and organized system, as well as actual machines and tools in use. A deduction of 20 per cent. from the producing power of a large manufacturing establishment means more to the community than a deduction of one fifth of the laboring force.

The organization of labor has thus far proceeded upon a false assumption, namely, that the wage-earners are a class having rights and interests other than and different from those of other classes. In a republic, where all men are equal before the law, and where the theory of government presumes that the greatest good of the greatest number will be sought in the framing and execution of all statutes, the idea of class rights and interests is mischievous. The interests of the wage-earner are the interests of all citizens. The time cannot be far distant when the need of yet another organization among the workingmen of this country will be recognized—an organization to protect intelligent and conservative men in the exercise of their civil rights against the oppression of those who follow the lead of dangerous demagogues, and are blinded by ignorance, prejudice, and passion, to their own welfare. The happenings of the past six months have been very instructive as emphasizing the tendency of labor to oppress labor, and the need of protection for those of independent thought and action against its cruel coercion. The order of Knights of Labor, however restrained, cannot accomplish this object. Its purpose, as defined in its fundamental law, is not that to which a majority of the thoughtful and intelligent wage-earners of the country can subscribe. It demands a scheme of national and State legislation inconsistent with the best interests of the community, and especially of the wage-earner. Those who are attracted to the order by its profession of principles are not safe leaders of a movement which wise men can follow.—*Carpentry and Building.*

Proportion of Rooms.

SPEAKING on the subject of proportion of rooms, with reference to their sanitary features, Douglass Golton says: "For purposes of ventilation the height must bear some relation to the size. Adequate movement in the currents of air cannot be secured in a room unless the height be proportioned to the width and length. The minimum height must be fixed with reference to that which will allow the currents of air to circulate without being inconvenient to the occupants. Therefore, in proportion as the width and length of a room are increased, so must the height be increased. On this account it is not advisable to make rooms much less than ten feet high. With large rooms, as the height should be increased in proportion to the size, if the cubic space be the measure of the number of occupants, the area or floor space per occupant would diminish with the size of the room. As, therefore, the height of rooms is necessarily variable, it follows that it is rather the floor space which must be considered in allotting accommodation to the occupants of a room than the cubic space. In barracks a floor space of from 50 to 60, and occasionally 80, square feet is allowed per occupant. These are for rooms occupied by day as well as for sleeping-rooms. In work-houses, for dormitories, a minimum floor space of 25 square feet has been admitted, provided the ventilation was carefully attended to. In nurseries and servants' rooms from 50 to 60 square feet are desirable per occupant—that is to say, a room 10 feet square, or 10 feet by 12 feet in area, should not contain more than two persons. In school rooms which are only occupied during parts of a day, and where the air can be changed between the periods of occupation, a less amount would suffice, and from 15 to 20 square feet are sufficient."

Our Illustrations.—Plate 1, front elevation for a mercantile or business house. Plate 2, a cabinet and case of drawers. Plates 3, 4 and 5 descriptions of the ferry steamer *Solano*, the largest ferry boat in the world. Plate 6, the better class of Chinese garden huts, many of them being far more wretched in general appearance, the walls and roofs being covered with old tin cans, etc.

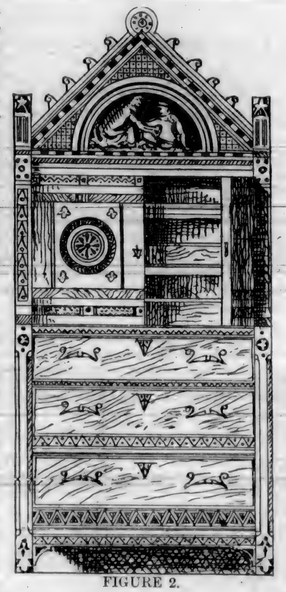

FIGURE 2.

But few fully and rightly understand or realize that errors may be committed in the erection of a home for their families calculated to produce sickness and death to loved ones. Yet it is so, and those who contemplate the erection, particularly of private dwellings, cannot exercise too much care and caution in every particular, so as to avoid mistakes and errors of every sort. Too often pretenders, willing to render services for nominal compensation, whose knowledge beyond the mere matter of drawing lines and coloring plans is exceedingly limited, and so far as possessed, of an imperfect character, are intrusted with the responsible duties of an architect. Consequently when they enter into detailments by specifications of that which is to be done, they conglomerate ideas so badly, and specify so much at variance with good mechanical judgment and common sense, that a superabundance of serious blunders and impracticabilities at variance with all proper mechanical principles follow. This is particularly the case in reference to plumbing and sewer work, than which there are no more essential features in connection with house-building. They commit, virtually, criminal errors; for their mistakes sometimes destroy more valuable lives than their own. Both owners and architects should consider this subject carefully, the former to avoid the mistake that all men are competent in the lines of business or profession followed by them, and the latter, not to claim an understanding of matters beyond their actual qualifications and the reach of improvement. No man is fitted to perform duties in any connection, who conceives the notion that beyond the bounds of his own knowledge there can be no advancement. Advancement and progression have been going on since the day that Noah left the ark, and sensible and practical men realize the fact that there is and ever will be more to learn, and that the fountains of improvement and knowledge will continue to flow so long as life lasts. It is only simpletons who *know it all*, and assert for themselves absolute superiority of thought and practice. Care is therefore necessary in the selection of parties to intrust with responsible duties, and owners will best subserve their own interests by its fullest exercise in connection with the erection of homes for their families. There can be no question but that *tens of thousands of lives* have been sacrificed by the employment of cheap, incompetent architects, plumbers, etc., resulting in imperfect dwellings, where, through defective plumbing and sewer work, the poisonous gases have entered buildings, to work out their own terrible results. The veriest fraud of a plumber will often assert absolutely perfected knowledge of the intricacies in this connection, and with the cavalierness of a highwayman claim that those things that have occupied and puzzled capable minds are, to him, well understood. Good meaning, honest owners are often entrapped by such deceivers into a reposal of confidence, which results injuriously. If the plastering, painting, and other works of a building are poorly executed, each and all are annoyances, but not fatal to health and life. Hence the importance of certainty in these special directions, by and through which alone healthful homes can be secured.

It would require 50,000,000 pounds of wire to erect a telegraph around the earth at the equator, and but a half-pound of the thread made by a certain species of spider.

The Ferry Steamers of California.

GREAT credit is unquestionably due those who conceived the plans, and to the skill and genius of California mechanics and artisans in the production of the many elegant and powerful steam vessels used as "ferry-boats" upon the bay of San Francisco and its tributary waters.

Pre-eminent for massiveness and power is the *Solano*, the special object of the accompanying illustrations, plying between Benicia and Port Costa, across the flowing and ebbing waters of Suisun Bay, and completing the connection of Central Pacific Railroad travel to and from Sacramento and across the continent, while the *Piedmont* and many other large and commodious passenger ferry-boats, fill out the link between San Francisco and Oakland. The *Tiburon*, *Newark*, *Bay City*, and numerous other elegant ferry vessels—population and travel considered—provide ferry facilities as great and comfortable as are to be found in any part of the world; and in the matters of convenience, size, and completeness, the ferry steamers upon the bay of San Francisco are unsurpassed.

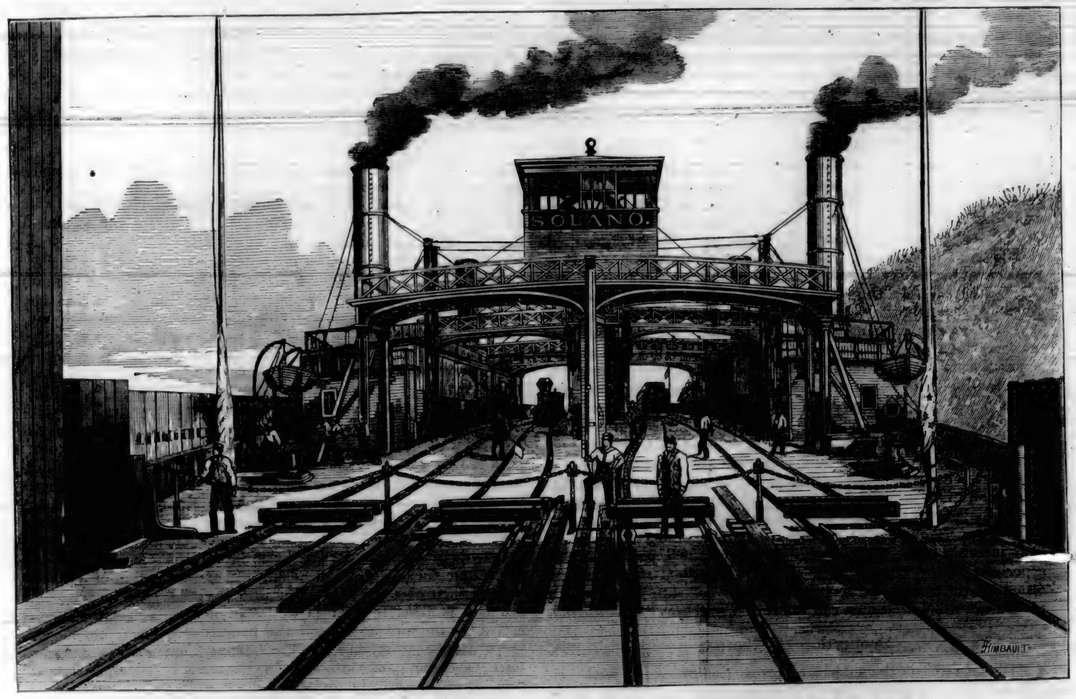

PLATE 3.—THE "SOLANO" IN DOCK, SHOWING GENERAL LONGITUDINAL APPEARANCE.

Equal credit is also due to the companies who have by their means brought about these handsome results, in that home labor and material have been employed in nearly every instance, and local industries encouraged. Large amounts of money have been disbursed among mechanics and working people in steam ferry enterprises. The first connection between San Francisco and Sacramento by Central Pacific Railroad was by way of Niles; but the considerable grades on that route and the greater business promise of a shore route, induced the company to seek a right of way along the margins of San Francisco, San Pablo, and Suisun Bays, and the straits of Carquinez. But the first change made in the location of the road, while it avoided grade, did not diminish the distance, and this fact, combined with other considerations, culminated in the building of a shorter and more direct line of travel. The distance between San Francisco and the capitol city, Sacramento, by the "old river route," is one hundred and twenty-five miles, and about the same by the first located roadways. To overcome this, and remedy the discomforts of tedious traveling by water, the project was conceived of building an air-line railroad across the tule and marsh land and through the counties lying westerly from Suisun Bay. To this end, proper surveys were made, showing a decrease of nearly forty miles.

In order, however, to render the proposed new route practicable, it was found necessary to establish a ferry at Port Costa, situated thirty-two miles from San Francisco. To gain time was the principal idea which led to the conception of the largest ferry-boat in the world. Size, indeed, was needed in order to accommodate the numerous trains, crossing and re-crossing, in order that travelers and merchants would not suffer from long and tedious delays incident to small boat accommodations.

It will be noticed that there are four lines of rails on the deck of the steamer. To show its immense carrying capacity, the following measurements will enable any one conversant with railroad cars to estimate the number the *Solano* will take at one time. The extreme length of the main deck is 494 feet 8 inches; length of hull, 406 feet 2 inches; width over all, 116 feet; width between wheel casings 64 feet; height amidships, 18 feet 6 inches; height at ends, 15 feet 9 inches; draught when loaded, 6 feet 6 inches; tonnage 3540 tons. From the above measurements, it will be seen that there is ample accommodations for forty-eight freight cars, or twenty-four passenger cars, besides locomotive and tender. As long trains have to be divided, it is necessary that an extra locomotive accompany each train that is ferried over. Our engraving also accurately shows the arrangement of the apron or stage by which trains are transferred to and from the boat. This is so nicely arranged and balanced that scarcely a jolt is felt by the passengers in the cars when the train leaves the steamer for *terra firma*.

Two separate vertical beam engines propel the boat. These were built by Messrs. Harlan and Hollingsworth, of Wilmington, Delaware. The cylinders are 5 feet 2¼ inches in diameter, with 11 feet .28 inches stroke. Each engine is fully capable of developing 2,000 horse-power. Steam is furnished by eight boilers, each 7 feet .25 inches in diameter and 16 feet long. They are made of steel, and have 143 tubes 3.94 inches in diameter, and 16 feet long. The total heating service is 19,630 square feet. No coal is used, the steam being developed by the burning of crude petroleum. The wheels are 30 feet in diameter and have 24 floats. Each wheel can be worked independently of the other. Unlike any other steamer that we have seen, the wheels are not on a line, one being considerably in advance of the other; this was done so that the boat could be easily and quickly turned in order to enter the slips on each end of the ferry route without injuring the same.

The above engraving represents the general construction of the *Solano*. Beneath each line of rails runs a deep Pratt truss, the top flange of which is attached to the deck and the bottom to the hull of the boat. The latter is divided by bulkheads into

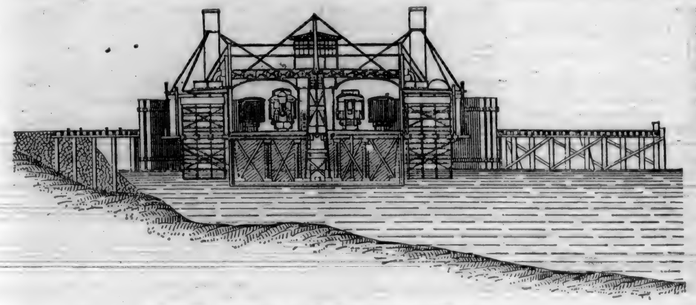

PLATE 5.—FIG. 2, SECTIONAL VIEW OF HULL.

twelve compartments. There are four balanced rudders at each end of the vessel, 10 feet 6 inches long and 6 feet 6 inches high. These are worked by hydraulic steering gear, but can be actuated by hand when desired. The pilot-house is more than 40 feet above the deck. The stages, or aprons, for embarking and disembarking trains, are massive iron structures, 98 feet 6 inches long and weighing 150 tons. They are provided with four lines of rails, and are controlled by hydraulic gear to adapt their position to the rise and fall of the tide.

The two towers seen in the back ground (Figure 2) near the center of the engraving, are similar to those near the slip where the *Solano* is at rest. They mark the entrance to the slip on the Benicia side of the bay. The large mountain on the right is called Mount Diablo. The track on the right is the one by which passengers and freight are conveyed to Stockton, Los Angeles, New Orleans, and way stations. It also connects at Lathrop with trains for Sacramento and all points east to New York, *via* Central Pacific Railroad. Immediately around the turn as shown, are the immense warehouses and docks of the Nevada Transportation Company.

Some difficulty was experienced in selecting a name for the subject of this article. The inhabitants of Benicia, with a just pride, desired the leviathan to be named after that place. After careful deliberation, the company decided that too much confusion would likely be caused in regard to the distribution of mail matter. Letters and packages intended for the boat *Benicia* might be delivered to the town by that name, and *vice versa*. So the name of the county in which Benicia is situated was given to the magnificent specimen of marine architecture, justly entitled to be called the largest ferry-boat in the world.

Why Nearly All the Railroads Are Four Feet and Eight and One-half Inches Wide.

A CORRESPONDENT asks: "Why was the standard gauge of railroads fixed at 4 feet 8½ inches? What was the scientific reason for adopting the fraction of an inch?"

There is no scientific or any other reason for it, except precedent and custom. In fact, all scientific or practical considerations that can enter into the question are against it. When Mr. Stephenson built his first locomotive, he, for some reason best known to himself, built it to the gauge of the old tramways—for vehicles drawn by horses—in England, which was 4 feet 8½ inches. That became what was known as the "narrow gauge" in England, and was naturally followed in this country to a very great extent. Some of our roads have a gauge of 4 feet 8½ inches; others, 4 feet 8¾ inches; and still others, 4 feet 9 inches. In England they have a 6-foot "broad-gauge," and at one time, for a very little while, tried a 7-foot gauge. The Erie road, built by English capital, was at first a 6 foot gauge, but in 1876 the changing of it to 4 feet 8½ inches was begun, and now it is all of that gauge. The Pennsylvania Railroad Company uses a gauge of 4 feet 9 inches, because that is a compromise gauge between the former gauge of 4 feet 8½ inches on the Eastern lines and 4 feet 10 inches on its roads west of Pittsburg. It would be well if the 4 feet 8½ inches gauge could be widened a little, to enable greater width of the fire-boxes of locomotives, and consequently more powerful engines, such as it would be desirable to employ.

Light colors absorb less and reflect more heat than dark colors. White is the best reflector, and black the best absorber and radiator, provided the colors are not covered by coatings of varnish.

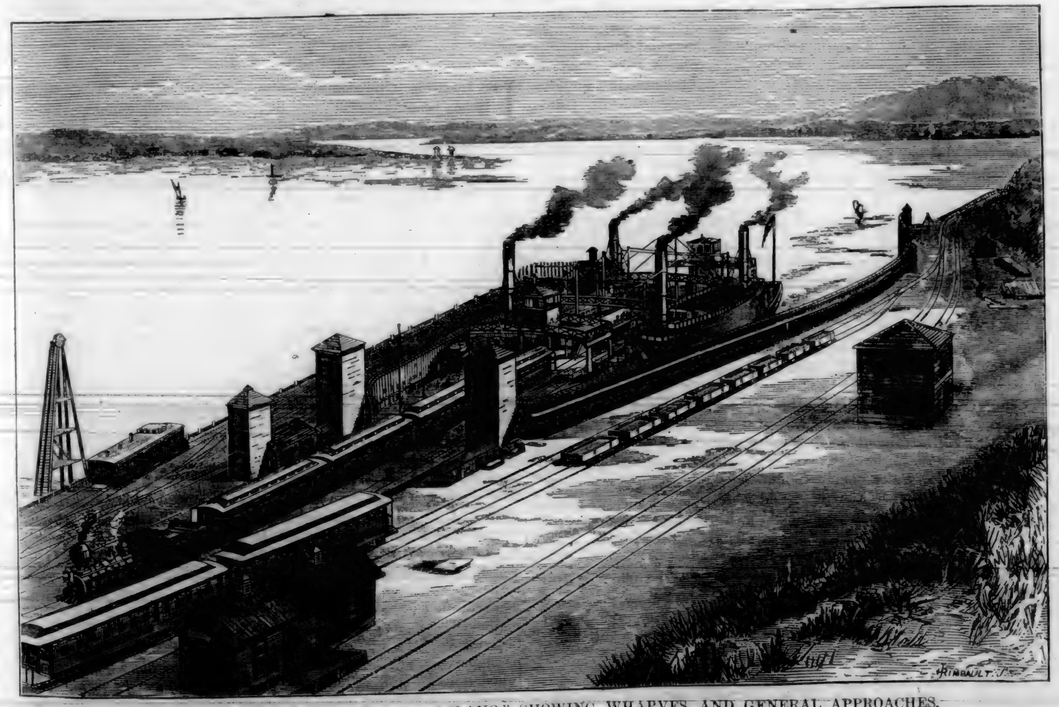

PLATE 4.—ISOMETRICAL VIEW OF "SOLANO" SHOWING WHARVES AND GENERAL APPROACHES.

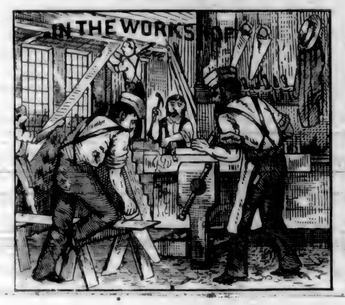

We will be pleased to receive for publication in this column items of information in regard to practical ideas connected with the mechanical part of the building trade. We especially invite suggestions from apprentices and young mechanics.

"A carpenter is known by his shavings." He is also known by the character of his work, and the state of his tools may be known by the same standard.

To Find Number of Studs Required around the Outside of Building.—Take three-quarters of the circumference—in feet—of the outside of the building. Add one stud for each corner, angle, and opening; or, allow one stud for every foot of the outside measurement.

In planning stairs, think of your head room from the lowest starting point to the highest landing, or somewhere in ascending or descending stunning falls and broken limbs may accompany bruised foreheads and broken heads.

The "Steel Square and Its Uses," as it originally appeared in these columns, will not be published in book form. We have, however, a work by that name which we will forward to any address upon receipt of $1.00, either in coin or one-cent stamps.

Bad work is set out by the "rule of thumb."

Driving Nails.—The handle of a hammer should be grasped at a short distance above the end of the handle, in such a manner that the end of the handle projects an inch or more beyond the side of the hand. The hand and the eye act so well together in concert that, after a little practice, the amateur will have no difficulty in hitting a nail square on the head. If not so hit, the force of the blow will be partly lost, and the nail will be moved out of position. In driving nails in hard wood, a hole should first be made, either with a brad-awl or a gimlet. Sometimes a knot will cause a nail to swerve from its right direction, and even to curl up, thrusting the point through the wood at no very great distance from the hole at which it has entered, "coming out," in workman's parlance, "*to have a look at the fool that is driving it.*

One thousand feet of lath are 2,000 pieces, and will cover 120 square yards.

Jack Planes; Why so Called.—"Since every Jack became a gentleman, there's many a gentle person made a Jack." So wrote W. Shakespeare, Esq., in his immortal tragedy, "Richard III." The term "jack" seems to have been applied to any mechanical contrivance for replacing the personal service of an attendant, or to an implement subjected to rough and familiar usage. In England the most common name is John, and the familiar synonym of that cognomen—Jack—was applied to the plane. It is derived from the Jewish word "Jacobus," and was corrupted into "Jacques" in France, and, being the commonest Christian name in the latter country, was used as a contemptuous expression for a common man; hence the term "jack" is applied as mentioned above. Besides the jack plane, we have roasting jack, jack screw, boot jack, jack towel, jack boots, black jack, etc.

One and one-fourth yards of good sand will suffice for 100 square yards of plastering; 1½ barrels of lime for one coat, and 2½ barrels for two coats, for same number of yards; one bushel of hair to above quantities. One-third barrel plaster will hard-finish 100 square yards.

Tall Chimneys and Spires.—Lowell has four chimneys over 200 feet high. The Merrimack Company has two chimneys 283 and 206 feet respectively; also 110 steam engines. Glasgow, Scotland, has a 446-foot chimney, not for smoke, but for chemical fumes, and another chemical chimney of 350 feet; and Manchester, England, has one of 415 feet. The Merrimack Company's is the tallest smoke-chimney in the world. The Tremont and Suffolk Company has one 225 feet, and the Lawrence Company one 211 feet. The chimney of the Pacific Mills, Lawrence, is 227 feet; that of the Navy Yard, Boston, 239½ feet. Bunker Hill monument is 221 feet tall. Trinity Church spire, New York, is 284 feet.

Fifty pounds of building paper will cover sixty yards.

Many thoughtless workmen seem imbued with the notion that the more glue there is used in joining wood together, the stronger will be the joint. This is a great mistake, for a *thick layer of glue makes a weak joint.* Indeed, the thinner, in reason, the glue, the stronger will be the joint, the great desideratum being the exclusion of air. If the air could be *entirely* expelled from between two surfaces, they would adhere one to the other without glue. In the manufacture of a certain sort of glass, where one piece is ground against another to bring them to a *face*, it is sometimes the case that the air is so perfectly excluded that the two plates adhere so firmly to each other that they cannot be separated without fracture. Glue should be used while hot, and the surfaces to be joined rubbed together before the clamps are applied.

Whitewash.—One-half bushel good, fresh, unslaked lime. Slake it with boiling water, covering it during the process, to keep in the steam. Strain the liquid through a fine seive or strainer, and add to it a peck of clean salt, previously dissolved in warm water; three pounds of good rice, ground to a thin paste and stirred in while boiling hot; one-half pound powdered Spanish whiting, and a pound of clean glue, which has been previously dissolved by first soaking it well, and then hanging it over a slow fire, using an ordinary glue pot. Add five gallons of hot water to the mixture, stir it well, and let it stand a few days, carefully covering it over. *Must be applied hot.* One pint will cover one square yard of finished surface. This wash retains its brilliancy for years; can be applied to surfaced lumber instead of paint.

Tints may be imparted to whitewash by adding a little blue black, or indigo, or orange red, or Venetian red.

The Flight of Time.

Its tramp is steady, quiet, rapid, sure, and its periods certain. It has been flying for myriads of ages, carrying with it growth and decay, happiness and misery, light and darkness, sunshine and storm; and still it speeds its onward course, heeding not the wails of grief and anguish, as it lands one after another of the human family beyond its confines. Its history is made up of joys and sorrows, hopes and disappointments, bright suns and dark hours, silvery lit and starry skies and midnight gloom; balmy zephyrs and resistless storms, each and all passing away *in the breath of time.* Millions of years mark its duration, and millions more will yet pass to its account; yet it matters not how fast it flies, if in its flight it bears no story of misspent days and hours, as far as those now wafted upon its ever-vanishing course are concerned. Its records will tell how well or badly each has improved its fleeing moments. That which has been and is we know. That which is beyond in the vast immensity of the great hereafter, is hidden from human knowledge by the dark and impenetrable veil of uncertainty, through and beyond which no mortal eye hath seen or penetrated, except so far as revealed to multitudes who live in the light of faith in things not made manifest by sight, allured by the angel Hope to realize that when time and mortality to them shall have passed away, a brighter and better condition awaits them, where, purified from all the entanglements and ills of time, the realms of purity and perpetual rest will be entered and enjoyed; where, in the immortality that will abide forever, they will revel in scenes of perpetual peace and uninterrupted love and purity. Thus the votaries of Hope, holding faith in future bliss, draw consolation to themselves, and the embitterments of time are mellowed and softened by the dews distilled from faith in things hoped for. Still flying time stops not nor pauses in its speedy passing away, nor stays its onward course, because from its embrace millions and millions of human kind have passed away, nor any remain beyond their allotted time to enjoy its enchantments and opportunities.

ASKED, ANSWERED, AND COMMUNICATED.

☞ Architects, Contractors, Carpenters, and Mechanics generally are respectfully requested to furnish us items of interest for this column. We will gladly answer any and all questions pertaining to the architectural and building interests. If illustrations are necessary to explain your ideas, send us a sketch of them and we will make the cuts.

A young mechanic inquires for a "correct method of finding the length of one of the sides of an octagon, the diameter being given."

Rule.—Knowing the diameter of an octagon and the length of one of its sides, to find the length of side of any octagon, add or subtract, as the case may be, to the known length, two and one-half inches for each six inches of diameter.

In order to use this rule, it will be necessary to remember some one certain measurement. Assume 8 feet as the average width. The length of side will be 3 feet 3¾ inches. Paste this with the rule on inside of your tool-chest lid. Suppose diameter is 9 feet 9 inches. Difference between 8 feet and 9 feet 9 inches is 21 inches. Apply the rule, and we have $3\frac{1}{2} \times 2\frac{1}{2} = 8\frac{3}{4}$; add this to the length of side given, and the result is 4 feet ½ inch, which is the correct length of side.

The weight of zinc per superficial foot is as follows:—

Nos.	10	11	12	13	14	15	16
Weight, oz.,	9	11	13	16	19	22	25

Never use iron nails in laying zinc, as iron and zinc combined, causes galvanic action, which ultimately destroys the latter named metal.

There is no absolute need of painting zinc work; for exposing it to the atmosphere has the effect of coating it with a thin film of oxide, which protects it from the further action of the air as effectually as paint.

Paper Hanger's Paste and How to Apply It.—Good paste for paper hanging is made of old flour, mixed to a milk-like consistency with water. When put in a kettle to boil, a little size or glue may be added, which will increase its tenacity. A little alum may also be added, in order to keep the paste sweet and to cause it to spread more freely. When boiled, it should be of the thickness of ordinary gruel, and laid on the paper smoothly and equally with backward and forward strokes of the brush. Care should be taken not to load the brush with too much paste at one time, lest the paper be rendered too damp. When an overabundance of paste is used, a little is pressed out at the edge when the cloth is used to dab the paper against the wall. This may be removed by a sponge dipped in clean water.

In answer to a student; there are three primary Greek orders: Doric, Ionic, Corinthian, to which the Romans added the Tuscan and the Composite.

The ancient Greeks seem to have been unacquainted with the principle of the arch, all their doorways, windows, and spaces between columns being on the principles of the architrave. In Roman architecture, the arch is one of the principal features. In Greece, the rivers are very small and the means of crossing them were simple; but in Italy the width of the rivers necessitated the use of arched bridges.

Dormer windows are small windows built out of a high-pitched roof; they are so called because they were originally used for dormitories or sleeping chambers.

A woman made the first orange box in California, and has built up an industry that now amounts to 50,000 boxes a year. —*Ex.* Truly, Californians have to go away from home for items.

Indications point to an increased price for tools in the wood-working line. Mechanics should make calculations accordingly.

Mortar and paint may be removed from window glass with hot, sharp vinegar.

Soot falling on a carpet, if covered thickly with salt, can be removed without injury to the carpet.

A good moth powder is made of ground hops one dram, Scotch snuff two ounces, camphor gum one ounce, black pepper one ounce, cedar saw-dust four ounces; mix thoroughly, and strew among the furs and woolens to be protected.

Largest Mass of Solid Brick Work.—The Mengoon pagoda is one of the most interesting sights in Burmah, and in its unfinished state is the largest mass of solid brick work in the world.

Origin of the Doric Shaft.—The Doric shaft, with its characteristic diminution and channelings, was known in Egypt more than 1,000 years before its introduction into Greece, as is proved by the monuments of Beni-Hassen. Commercial relations had existed between the two countries for centuries, and it cannot be assumed that the Greeks had not seen Egyptian works of architecture. They could not have arrived at precisely the same results by independent invention.

New York City embraces an area of 24,394 acres.

"Too Many Irons in the Fire."—This is an old proverb, another version of which is: "He that hath too many irons in the fire, some of them will burn." This morsel of metaphorical wisdom, evidently the work of a blacksmith, is, of course, intended as a warning against undertaking too much, and, at first sight, sounds like a prudential maxim, well adapted to secure efficiency and singleness of aim on the part of all workers. But, more closely considered, the precept shows for itself what it really is—a piece of narrow-minded, petty prudence, adapted only to the guidance of incapables and fools.

The fact is, nobody who is good for anything needs any such cowardly caution about having "too many irons in the fire." Your active, efficient characters, they who do the largest share of work in the world, are the men who want and will have a great many "irons in the fire." Shovel, poker, tongs and all, these masterly workmen keep them always hot and always busy. The rapidity of their daily accomplishment is only equaled by its variety. Both their combinations and their execution are such as perplex and startle little minds, and lead them to repeat in full chatter much such petty maxims as the one now under consideration. It is by such men that human progress is advanced, inventions and discoveries are made, fortunes are won, and all valuable improvements and reforms are achieved.

One cwt. per superficial foot is an ample allowance for the probable load on an ordinary dwelling-house floor, exclusive of the weight of the floor itself. Two cwt. per superficial foot is sufficient, in many cases, for warehouses and factory floors.

The weight of a crowd of men closely packed is about 84 pounds per superficial foot.

Girders are often sawn through the middle, and the two pieces bolted together with the sawn sides outwards, not, however, as is often erroneously supposed, to increase the strength of the girder. It is really weakened by such an operation. The main benefit to be derived is that an opportunity is given to examine the heart of the timber, and thus expose cases of rottenness. Girders cut as suggested are much less liable to rot. The oldest author on architecture, Vitruvius, "directs a space of two fingers' breadth to be left between the beams for forming the architrave over columns in order that air may circulate between and prevent decay." Every observing mechanic has noticed that decay begins at the joints and other places where the pieces are neither perfectly close, nor yet sufficiently open to allow any dampness to evaporate.

In Amsterdam, there is a floor constructed which has no joists whatever. The room is sixty feet square. The floor consists of three thicknesses of tongued and grooved flooring, each layer being one and a half inches thick. The first course is laid diagonally across the opening; the second, also diagonally, but the reverse of the first; and the third course is laid parallel with one of the sides of the room. Each layer is securely nailed to the other. The middle of the floor is kept about two and one-half inches higher than it is at the sides of the room.

Art and Architecture.

[Special for this Journal. By F. Hillert, Architect and Mechanical Engineer.]

IX. THE SENSE FOR BEAUTY.

As the first efforts in forming must naturally have been crude and simple, nevertheless man tried any way to give to the objects of the same a form which pleased him, if only by its agreeability the purpose in view was expressed. So is it proper, even on the most primitive or simple building, a projecting cornice is attached, that the rain-water falling from the roof does not run down the wall; but this cornice gives to the structure an indicating and marked form, pleasant to him if only by the purpose which is by it expressed. Gradually we seek, with consciousness to perfect the necessary and required raw material to such forms, agreeable to the purpose, which, on the whole, finish and complete a work pleasant to our view. In this way manifests itself in the highest degree the impulse or drift to form the sense for beauty. But this sense for beauty is manifoldly graded, and shows itself in most different ways; nevertheless it is the highest ornament of a nation, and the high perfection of the same by the Greek people, giving to them as such the brightest luster, and shine for all time to come. With the development of such perfections is necessarily united and conditioned a high standard of culture of the impulse for liberty and truth; then the last impulse could not express itself either with a nation existing in brutal stupidity, or with such living in despotic fetters and bondage, or living together in immoral concubinage. There would be the sense for beauty, and its expressions and manifestations for nobody's approbation and admiration, and never would come to a perfect execution. Here it would shrivel through fear, or grow wild in licentiousness. Uniform harmonies, development of thought and will, are indispensable for his own perfection, and by the same he gains such active capacities as he can and must use and apply for the general culture of mankind.

X. ITS IMPORTANCE FOR THE EDUCATION OF THE HUMAN RACE.

That the sense of beauty is necessary and unalienable for the promotion of the education of the human race, is clear and evident in every way. If we would take the sense to feel it from our world, we would cease to be human beings. Not only would it destroy the one who is used to live in artistical ideas, and find in its enjoyment the highest pleasure and satisfaction, but even of the most modest and contented every attraction to live would be taken away; from the simple peasant girl, the pleasure of a flower; from the wild man of the desert, the delight in his plumage and colored adornment.

With necessity is the sense for the beautiful implanted in humanity, and in each human being are unquestionable traces to be found. By the awakening, enlivening, and cultivation of the same will be effected the imperceptible, uninterrupted, and most powerful influence on the whole human race. He knows to give form to the first religious inspiration; he permits the eye to rest always, and always with love, on nature; it leads to deep meditation over the same; it leads to respect of the sexes, to mildness of manners, and, lastly, to art; and by artistical works a considerable retractive effect is exercised. The importance of the sense for beauty has been intelligently explained and made to become universal property. It would therefore appear as if beauty is only the servant of attaining truth; but this is an illusion; for if this be true, it must be first established that the highest purpose of life would be exclusively the attaining of truth. But who will assert this, since the purpose of life could be, with the same right, the perfect ennobling and refining of our soul, the reaching of the highest good? And, lastly, should not also the attaining of the highest beauty, in the viewing of the "epitome of all heavens" be revealed and disclosed,—be a worthy purpose of life, but not an exclusive one? But also this cannot be correct. The spheres do not exclude, but condition each other; are inseparable, and act always through and by each other, so that it is no profanation of Christian mysteries, but a deep, in its If supported, truth, when in the meaning and comprehension of the sense of the "undivided Trinity," truth, goodness, and beauty, the common aim of the intellectual, the ethical, and the esthetic impulses of men have combined. So aspires the sense for the beautiful to the same aim, and finds, lastly, its termination in the same idea, in which rest the origin and fulfillment of truth, and liberty, God.

XI. ART AND POETRY.

As far as history dates back, we find in the earliest nations the coincidence of activity in the sense of the beautiful in the most differing and manifold manner. The first traces of the same appear in the habiliments of man, his utensils, arms, and such like, which were embellished, not showing directly their practical purpose, *i. e.*, the seam in a cloak being covered by a strip of cloth of a different color; or such as by the form of the object the purpose and its conditions were directly visible and evident, as in a column, as of something free-supporting. To such structures nothing compels man but his own instinct and drift, so that which he makes he gives its form a charm, pleasant to the eye or ear, to read on his mind by the two organs, to give him pleasure in the object made.

Such exertions in the sense of beauty we name art, in the widest sense, or poetry, poesie. Then here are the arts of forming and sounding not yet separated, and the Greek word and meaning taken therefrom means a making, producing, and forming by tradesmen as well as artists and poets. The law which guides and inspires him is his own feeling and sense. He is able to bring the undetermined into form and shape. He is able to perceive, if his inner instincts and impulses are expressed, that his sense of beauty is satisfied. The process which goes on in the mind of men we lead back to the fancy or imagination, that is, the capacity of the soul to conceive and put before her things or objects which the organs of sense do not observe. Free and independent out of his imagination and conception, man learns to make and form beautiful objects and things, and he uses for this purpose the natural material and stuff, to bring them (beautiful things) into existence.

XII. DIFFERENCE IN THE ARTS OF SOUNDING AND FORMING.

Is the material or stuff used or employed words or sounds, then the objects formed belong to the dominion of the sounding arts, poetry in the closer sense and the art of sounding or music. Are the former objects of a bodily form, then they belong to the domain of the forming arts, such as the art of building, sculpture, painting. The means of the first group, that is, the condition by which necessarily the work of the same reach our observation, is time. Those of the latter group is space. The objects of the first group act on the ear, and its forms are conditioned by the motion in the time. Those of the latter act on the eye, and its form is conditioned by bodily stuff being in space. Different are both kind of objects, not by their origin and meaning, but merely by the way and manner in which the originators brought them to appearance and expression. There exists not only no opposition and contradiction between each of them, but more of a complete uniformity in their origin. Both are only daughters of the same mother; but she gave them to different husbands, and the children of the one worked with rule and square, the chisel, the palette, while those of the other took to the pen and to the lyre; but not one of them denies the common origin, and they acknowledge and recognize each other as sisters and brothers, and all breathe the same inspiration.

A series of pursuits and activities are rightfully included in the arts, but with the same rights the objects of the same belong to the beauties of nature. Those are all living, and man only forms the living, without taking from them the conditions of their origin and the passing from their existence. They form and make a transition from nature to art, and consist principally in the art of gardening, dancing, with the art of riding, to which may be added mimic and the art of play acting.

XIII. ART AND THE BEAUTIFUL.

The common definitions and explanations of "Art" and its spirit are, as known, insufficient and partly empty phrases. This lays in the difficulty of giving a definition of "Beauty," and we must limit ourselves to understand and comprehend the capacity of man to produce beautiful objects, either immaterial, as the bodily or the sounding, and further expanded and narrowed down to the totality of all such things, which we call works of art, although we should use analogy, as in the dominion of nature (kingdom of animation), the kingdom of art. If we would give an abstract definition of art, we would lose ourselves in the domain of phrases, or proceed solely descriptive, by separating the human action from its subject and make it objective. In the last manner may be seen in art a presentation, that is, an activity, by which the inner thought or spirit comes to appearance. But this illustration is hereby so limited and bounded that

this activity has no useful, practical purpose, but only to produce or represent. It is clear that by this definition man is forcibly removed, but again being introduced in the same, it would only make clear that art is nothing else but man's activity, respective capacity, to produce and make beautiful things. In the same time it has been tried, those which are beautiful things, to be solved with this definition. Nobody and nothing gives us the right to exclude man from this definition of art, since art is not conceivable without a human representative, or its products without a human originator. Art, man has alone.

XIV. WORKS OF ART.

The object and purpose of art are the making and creating of beautiful things. Beautiful things made by man are therefore works of art, and only because they are beautiful are they works of art. The spirit of a work of art is its beauty, and, figuratively speaking, the purpose of art is beauty. Things having another purpose are called useful, lovely, agreeable, useless, or bad.

If now we review a multitude of such things, which generally are included within the sphere of art, we find between them a large number of such which, to us, do not appear beautiful, and which we must call ugly as the works or objects of remote people; nevertheless we don't object to adopting them as works of art. The reason therefor is that such things and objects, at the time they were made and to their people, appeared beautiful; or were considered as such by their own maker. Who could in real earnest call beautiful the images or figures of the Assyrians at Khorsabad, the paintings of the Egyptians, or a Madonna of the Byzantines; and who could call beautiful the abortions of the Rococco? The decision on all these objects is, that they were produced by the originators in a clear, or in an indistinct and with an unconscious intention to make beautiful objects; or that, at the time of their creation and making in general, they were thought to be beautiful.

A complete contrary and contrast would be that which was made intentionally to be ugly and was made ugly. Such an idea of ugliness does not exist, since all which is ugly or kindred to it has other purposes to fulfill; let it be for the existing of fear or grief, a tickling of a sensual pleasure, or other perceptions or objects, transformations and deformities, as exist in nature. The humoristic, the comic, and the satirical are connected herewith, and will be mentioned hereafter.

An uncultured, coarse sense and mind will hold that as beautiful which appears to a cultured and refined mind, hard, ugly, and such like. With the general advance of education and culture, the appreciation of beautiful things will increase with the individual man as well as with whole nations—and the human race. In regard to its orginator, he shows by his work of art his own coarse or refined sense, and since the same, with very few exceptions, always corresponds and is the outgrowth of the sense of beauty commonly existing in his people; then this work of art will show the sense, way of thinking, and sense of feeling of the whole nation. In the series of the works of art made by the same is revealed its inner and particular development and historical culture, which would, without the same, be forever lost and unknown to us. What would we, for example, know of the Greeks, if of the high temples and towns, of the marble figures of the gods, of the pictures and utensils, no trace was preserved; the genius of Homer would be dumb and silent to us, the muse of Sophocles lost forever, and all that which, being kindred to those spheres, would be to the slightest presentiment strange to us. To think this, though, is already impossible, since Greek life without art is not conceivable. By our works of art we will be judged by posterity, justly, according to the merits of the present age.

XV. BEAUTY.

Since the purpose and the spirit of a work of art is the beautiful, we have now arrived at the question: What is beauty? A general logical definition of beauty cannot, by any means, be established or put up; since it must be brought back to that capacity of man which is not of a logical nature, the mind. But the beautiful is, nevertheless, not possible without certain practical relations; the same are again to be put up with difficulty and explored, as the reasonable necessity of a conclusion is missing. Then, from the divided opinion of men, and the want of proof bearing the logical test of such opinion, to call an object beautiful is to raise the question, Are objects beautiful themselves, or do we only feel in our minds the impression of beauty; or, Is beauty an objective property of bodies, such as gravity, expansion, color and such like; or, Is it only a subjective sensation in man transferred to one subject? Without illustrating these points for and against it, and perhaps arriving at a result, it may be sufficient to state that beauty is neither purely objective nor purely subjective, but is both at the same time. If beauty was purely objective, she must appear to all men alike, as a red colored body must appear red to all; but would beauty be purely subjective, she would not make on the many one and the same impression, but would appear different to all; so much different from each other as each individual man's form, mode of thinking and of feeling, differs from those of another. At the same result we would arrive, when we reflect that beauty is not purely spiritual, but is attached to a certain concrete form, through which it operates on our senses by our eyes and our ears. The peculiar form being unconditionally attached to the object, is inseparable from the beauty of the thing itself; then the same would, when changed in its form, cease to be beautiful. In this sense, beauty is something objective, adhering to the thing itself. Otherwise is this form, for such a one not comprehending the same, just as incomprehensible as if beauty did not exist, and he would not call the thing beautiful; but only the one will find the same beautiful, having a suitable fine feeling, refinement, a fit and proper way and manner of perception, from which it can be concluded that the beauty is transferred to the things by the person enjoying it.

But how are we to proceed? If from general truth, a logical conclusion of the spirit of the beautiful cannot be formed, lays therein generally the impossibility to get closer and nearer to the same? or does a method exist which at least approximately leads to this aim? This is the empirical method, which tries to deduct from experience a principle. It has been truthfully said that we cannot proceed in the same way as in geometry, which goes from the general to the special, and singly and from the spirit of the thing to their properties and concludes, but we must content ourselves, from only single pieces, to draw probable conclusions. Of what sort or kind these conclusions must be is clear; that they cannot be purely defining the object; nor be purely of a physiological kind, to explore and investigate the affections and emotions in the human mind; but must refer themselves from the relation of the beautiful thing to man, which in the main will be objective and formative explanations. But the conclusive characteristic signs or marks which we perceive by viewing beautiful things are these—that the thing itself pleases us well, and that we in the same thing, merely as stuff and as a body, positively take no interest. When we, for example, find a bronze monument beautiful, we do not consider by far the value of the material which, when coined to pennies, would make to many no indifferent object. In this feeling, not wished for nor desired (disinterestedly) lays a deep satisfaction in the mind of man to make and produce beautiful things. The capacity and ability on which this satisfaction and pleasure is based. is "Taste," which is man's esthetic capacity of judging things in regard to the beauty of the subject; taste is ruling. The word "taste," being raised to a school expression, is nothing else than the sense for beauty of the single individual man, so that it is eas to be seen, in regard to the definition for the beautiful, we move around in a circumference. Two illustrative reflections come to our aid,—one that the pleasure of the beautiful is not purely sensitive, and the other, that in the appearance of the beautiful thing lays direct the semblance of a spirit; both differences we must recognize clearly and plainly by our intellect and reason. If now this contentment and pleasure are not purely sensitive and expanded, are not exclusively in our feeling, then they exist necessarily in accord with feeling and thought, the mind and the spirit, or, as may be expressed, in the harmonious play between imagination and intellect. But that in the appearance of the beautiful lays direct a spiritual sense, leads to the recognition of the purpose of the beautiful thing, which directly becomes perceptible; without that the intellect sees directly the purpose. The point in question is the spiritual meaning of the beautiful thing, which in the aspect comes directly to view, in the most suitable manner, so that a perfect harmony between the spiritual meaning and contents—the idea, and the outward appearance of its form, exists.

XVI. BEAUTY OF NATURE.

It is now the time to mention in a few words the relation of beauty in nature to beauty in art. In nature all things have certain practical reasons and purposes, and undergo and underlay an uninterrupted change; and beauty is here only an adornment of the necessary, even if the same in a higher sense itself is needed, and so united, that with and by each change, the same itself is changed, dissolved, or destroyed. The conditions under which beauty is attached to nature are inconstant, continuously beginning and ending. Man alone is capable of producing things of which beauty is not a subordinate aim, but is the sole and exclusive purpose, untouched by the changes of nature, unalienable, retaining its beauty, giving a presentiment of eternal duration.

(To be continued.)

PLATE 6.—CHINESE GARDEN HUT.

Graining.

In graining work that is paneled, the lights and shades of the panel should be stronger than on the rest of surface. The rails and stiles of doors should be more simple than the panels in the imitation of dark decorated woods, as rosewood. If the cross rails are full of work, make the upright stiles plain, for their appearance is changed by their position with regard to light. Perhaps the greatest triumph in staining is imitating successfully the curls of mahogany. Graining in maple wood is suitable for dining-rooms; the color of maple varies very much, and therefore it is necessary to select a choice piece for imitation. Pollard-oak graining suits well for a dining-room, with its warm color and rich effect, the color varying from the lightness of maple to the darkness of mahogany, so affording a range of choice. Oak color is adapted to all styles of wainscot, harmonizing with warm colors on wall space, whether this be papered or painted, and making pleasing contrasts with cold ones. It also looks well on the ceiling cornices of lobbies. In wainscot graining the lights and shades on the panels should be the strongest. If the prevalent color of a room be warm, the graining of the wood-work should correspond; if crimson, maple, satin wood, or oak graining may be employed; if green, some cool-toned and light-colored wood. Smoothness of surface is important in the grained imitation of woods, as well as the rendering of deep, transparent, and shadowy half tints. The grainer should not revel, as we have seen some do, in knots, which, indeed, should be left out, as well as the representation of cross-grained stuff, which the architects would avoid in real wood, whether for stiles, rails, or panels. Where wood has been previously painted, the grainer should examine it closely to see that it is not liable to peel off, and so spoil his work. Where marble has to be imitated, in order to secure a transparent effect the best polished copal should be used with colors, never turpentine.—*Painters' Magazine and Coach Painter.*

The world moves on, inventions and progress still rush together for the benefit of the present generation; but we look back with a feeling of veneration to the art and talent displayed in ancient architecture. In all the modern edifices of which we pride ourselves, the striking features are but a reproduction of the thought of the old masters, with the exceptions that we build in a few months buildings that would have taken them years to complete. We are gradually returning to the age of artistic wrought iron, cunning designs in brass, elaborate wood carving and marble tessellate pavements. Acquiring wealth rapidly, we are less inclined to look at the cost of the work so artistic and durable. The old Romans prided themselves on the marble floors of their dwellings, and the proof of their knowledge of its durability is demonstrated by the recent discoveries made in Roman ruins, where the marble mosaic pavement retains its original designs and colors. Of late years, an Italian artist, Mr. Caretti, has introduced this work in some of our new-fashioned residences, and a handsome design for the hall of Mr. A. D. Kohn's house is his latest work. Should, in centuries to come, Macaulay's New Zealander be digging in the ruins of Chicago, a marble mosaic pavement may be brought to light, and create a discussion as to whether Chicago was an old Roman city or the creation of a more modern age.

Some of our scientific exchanges are describing a kind of concrete that is said to be in use for building purposes in France. It possesses the desirable qualities of solidity and hardness. It is said to be composed of 8 parts of sand, gravel and pebbles; 1 part of common earth, burnt and powdered; 1 part of powdered cinders, and 1½ parts of unslaked hydraulic lime. These materials are thoroughly beaten up together, their mixture giving a concrete which sets almost immediately, and becomes in a few days extremely hard and solid, which property may be still further increased by the addition of a small quantity—say 1 part—of cement. Among other constructions to which this material has been applied is a house three stories in height, 65x45 feet, standing on a terrace, having a perpendicular retaining wall 200 feet in length and 20 feet high. Every part of this structure was made of the hard concrete, including foundations, vaults of cellars, retaining wall, and all walls, exterior and interior, as well as the cornice work, mouldings, string courses, balustrades, parapets, and the building is without band iron, lintels, or wood throughout.

In order to render glue insoluble in water, it is only necessary to add a little potassium bi-chromate to the water in which it is dissolved, and expose the glued part to the light. One-fiftieth part of the bi-chromate will suffice.

A bound volume of this Journal for either of the years 1880, 1881, or 1882, will be sent free to all new subscribers for balance of this year and 1887.

Glimpses of Sunshine.

Mechanics are apt to compare their life of toil and scanty pay to a long season of cloudy weather. They feel that they are under a shadow, hemmed in by circumstances which they cannot control, and that they must keep on treading, as does the horse, on an endless treading-machine. Skilled mechanics here and there have good-paying positions, but the great mass have all they can do to make ends meet. Probably this is partly due to this era of extravagance in the mode of living and of dress. The American mechanic cannot submit to live like a savage, nor even like some in our midst, who swarm together like pigs. He is fond of home, and no matter how humble it may be, he will make it as bright and cheerful as his means will permit; in fact, he is more likely to spend a little more than he earns, than he is to pinch and deny himself to save a few dollars every year.

But in the last ten or fifteen years the men who work at trades have experienced a steady decline in their incomes, partly from lower wages, and partly from lack of work.

It used to be that men were employed from January to December, but that day is past, and nine months is now about the average time made. Week and piece-work prices were formerly higher, and probably the employers obtained better prices than they do now. But labor-saving machinery has placed the employers on a footing by which they make as much clear profit as formerly, but it is distributed over an increased output.

The mechanics, especially the skilled ones, have had no means of competing by their labor, as an offset to the rapidity of steam power. The effect has been to push them aside, or compel them to accept greatly reduced pay, or turn their hand to something else. There has been a steady weeding out of good mechanics, and a steady influx of laborers who had brains enough to feed a machine.

Crowded out of their regular work, and compelled to squeeze in wherever there was an opening, it engendered a spirit of unrest, and a determination to make an effort to better their condition by concerted action. We now witness the result in the gigantic organizations that have been formed, and which are making demands that are rapidly being acknowledged by the public as reasonable and just.

For a time there was a chaos of doubts, fears, and misapprehensions on the part of the public, and even many workmen stood trembling, and fearful that the demands of organized labor would but increase their burdens. But when the workmen stated their case calmly and fearlessly, and showed that they were in earnest, and that nothing could swerve them from their purpose to gradually and lawfully compel just treatment, a little blue sky began to appear, letting in glimpses of sunshine in the form of concessions by a generous firm here and there over the country.

The Saturday half-holiday movement among merchants has grown out of the great labor agitation, and it is plain to be seen that capital is on the giving hand. Labor must not make unreasonable demands, even under sore oppression; but having once decided on what is fair and just, it should not cease all lawful efforts until its claims have been granted. The crying need of the hour among mechanics and laborers is a little business knowledge. They need to learn that but a small proportion of men have the ability to start and develop an enterprise which may give employment to hundreds of men.

They need to learn that out of these one hundred that are steadily employed probably not one of them has the business capacity to carry on the works for a single day. They need to learn that the finished products must find a market, and that the profits over and above the cost of labor, stock, and contingent expenses are not always sufficiently large to warrant an increase in the first cost.

When the majority acknowledge the above stubborn facts, they will be much stronger in self-defense, for it will guard them against foolish outbursts of temper, and strikes, which always result in heavy losses of money and great privation in their families. What labor needs is perfect organization, guided by common-sense views of business, and plenty of money to stand out against oppression.

The money can he easily had; for if one million wage-people pay in but one dollar a year apiece, a fund is at once created that in a few years will command the respect of even the most exacting capitalist.—*Painters' Magazine and Coach Painter.*

The *Journalist* for March says: "The trade journals are a recognized and important factor in the journalistic profession, and many of the brightest and ablest men in the country are engaged in their conduct."

Amateur Carpenters.

It is an excellent thing for any man, whatever his business in life may be, to acquire a fair degree of mechanical skill and familiarity with tools and machinery. Such knowledge never comes amiss, even if its possessor is so fortunate as to be under no necessity of ever using it as a means of livelihood; just as a thorough practical acquaintance with the minutest details of housekeeping is valuable to any woman, though she may be surrounded by luxury all her life, and have a servant to wait on her at every turn.

But it does not follow, by any manner of means, that an amateur or half-trained workman is profitable to his employer, even at half price, or at any price. Experiments of that kind are oftener made, it would seem, in the various branches of carpenter work than in most other trades—for the reason, probably, that it is easier and more common to pick up in a desultory way a superficial knowledge of carpentry than of other callings which do not in fact require so much skill and judgment for their thorough mastery. To become a good carpenter, capable of estimating a job fairly and performing it honestly, is a matter of not a few weeks or months, but of years of diligent and conscientious work. And while the temptation is very great, in awarding the contract for a job, to give it to the lowest bidder without due regard to the probability of getting the worth of one's money, it is generally found that a single lesson of that kind is sufficient. In a broad sense the rule that "the best is the cheapest" holds good in carpenter work, as in nearly everything else.

A vigorous protest against the employment of what it calls "saw and hatchet carpenters" is made by the *Southern Lumberman*, which imputes to them not only want of skill, but want of honesty as well. As an illustration, it mentions a building contract which one of that class of carpenters offered to take for $500, while the material alone came to $570. Somebody was badly cheated, of course, and probably the lumber dealer, the workmen, and the owner of the building all suffered more or less. Incompetency and false pretense in all trades and professions should be steadily discouraged; and the only way to put an effectual check upon them is to give the preference invariably to the trained workman, who has earned and can rightfully wear the title he claims.

What Will Come of the Labor Troubles.

Definite and excellent results will come out of the chaos of strikes and violence and the accompanying discussions. Experience is a thorough teacher.

The first result will be the cutting loose of respectable workmen from association with the anarchists. They see with consternation the hideous purposes of these social bandits, and are hastening to denounce them. The manifesto of the Chicago Knights of Labor has the right ring.

A second result will be an end of strikes and boycotts to force non-union men out of employment. The utter collapse of the great St. Louis strike and of the Third Avenue strike in New York, and the multiplying arrests of boycotters for conspiracy, settle that question. If men want to strike on their own account, they can do it; but by the same measure that their right to quit work is defended, the right of other men to earn a living by any employment that is offered them will be defended also, and at any necessary cost.

A third result will be a little longer in coming, but it will come. American workmen will learn the lesson which a majority of British workmen learned several years ago, that the only successful strike is the one that never occurs. The waste of strikes has become so enormous that the imagination can scarcely picture it. It has become a chief factor in trade depression, and, as such, a prime cause of low wages. The only way to raise wages is by keeping at work, respectfully presenting the demand for an increase, and abiding loyally by the decision of conference or arbitration, holding the strike in reserve as a last and extreme resort.

The present disturbances are deplorable and disastrous, but they will clear the air.—*Ex.*

Book Notices.

OSBORN'S TABLES OF MOMENTS OF INERTIA, AND SQUARES OF RADII OF GYRATION. By Frank C. Osborn, C. E. Is designed to supply partially, at least, a need felt by engineers and draughtsmen engaged in structural works in iron and steel.

DIRECTORY OF ARCHITECTS FOR 1886. By Byan & Co., Holyoke, Mass., and New York. Supplies in main part the names and addresses of architects in the United States, California included.

STEAM HEATING PROBLEMS. Published by the *Sanitary Engineer*, New York. Contains many valuable suggestions, and one hundred and nine illustrations, upon the subject treated. Its authorship is a sufficient guarantee of its value as a book of information upon its subject matter.

Report of Building Improvements for Woodland, Yolo County.

EDITOR CALIFORNIA ARCHITECT: The following statement presents the facts in connection with the building interests in this section for the first six months of each of the years named.

1883.—	26	engagements of all classes	value	$ 73,350
1884.—	53	" " "	"	135,852
1885.—	91	" " "	"	223,200
1886.	100	" " "	"	147,305

It will be seen by the above that the number of constructions in the six months of 1886, is nine greater than in 1885, but in cost, $75,895 less. G. & SON.

B

Brannan, cor. Langton. Two-story frame.
O.—Thos. Tierney.
A.—D. Salfield.
C.—H. Keenan.
$2,800.

Brannan, cor Ritch. Three-story frame and brick basement.
O.—J. L. Buckman.
A.—H. Geilfuss.
C.—H. Thom Wordben.
$8,000.

Bush, southeast cor. Octavia. Five two-story frames.
O.—David Samuels.
A.—Copeland & Banks.
C.—Treadwell & Thompson.
$35,300.

Bartlett, nr. Twenty-second. Additions to school house.
O.—City of San Francisco.
A.—Curlett & Cuthbertson.
C.—J. McCann.
$2,500.

Bartlett, cor. Twenty-fourth. Two-story frame, store and flat.
O.—W. Murphy.
Day work.
$2,500.

Baker, bet. Fulton and Grove. One and one-half story frame.
O.—Mrs. Schintz.
C.—G. G. Gillespee.
$2,100.

C

Clay, cor Webster. Three-story frame.
O.—B. E. Hardy, M. D.
A.—McDougall & Son.
C.—P. Griffin.
$6,000.

California, bet. Fillmore and Steiner. Two-story brick stable.
O.—A. Ioid.
A.—W. F. Smith.
C.—W. H. Fletcher.
$10,000.

California, bet. Cherry and Maple. Two-story frame. Children's Hospital.
O.—Directors of Children's Hospital.
A.—McDougall & Son.
C.—J. A. Leonard.
$13,000.

California, bet. Devisadero and Broderick. Alterations and additions.
O.—M. Mahoney.
Day work.
$600.

Chenery, bet. Thirtieth and Randall. Two-story brick and frame laundry.
O.—L. Barolles.
A.—W. Moesler.
C.—W. Fletcher.
$10,000.

Castro, bet. Eighteenth and Nineteenth. Additions.
O.—T. Trewen.
C.—O. D'Anis.
$2,000.

Castro, bet. Seventeenth and Eighteenth Two-story frame.
O. and B.—H. L. Kofoed.
Day work.
$3,000.

Castro, cor. Beaver. Two-story frame.
O.— — Sanderson.
A.—S. & J. C. Newsom.
C.—J. Rebman.
$3,000.

Church, nr. Market. One-story frame.
O.—J. Magee.
Day work.
$1,200.

D

Devisadero, nr. Sutter. One-story frame.
O. and B.—G. G. Gillespee.
Day work.
$600.

Dolores, bet. Fifteenth and Sixteenth. One and one-half story frame
O.—Mrs. J. De H. Deniston.
A.—J. Gash.
C.—W. E. Cummings.
$2,000.

Duncan, cor. Sanchez. One-story frame.
O. and B.—J. M. Comerford.
Day work.
$1,200.

Devisadero, nr. Hayes. Two-story and basement frame.
O.—A. B Block.
A.—S. & J. C. Newsom.
C.—Moore Bros.
$4,500.

E

Eleventh, nr. Harrison. Two-story frame.
O.—E Redmond.
A.—P. R. Schmidt.
C.—H. Keenan.
$2,800.

Eighth Avenue, nr. Point Lobos Avenue. One and one-half story frame.
O.—A. & C. B. Abraham.
A.—Townsend & Wyneken.
C.—C. N. Post.
$1,500.

F

Fillmore, nr. Clay. Two-story frame.
O.—Mrs. Frutiger.
A.—C. Kenitzer.
C.—C. Mason.
$5,000.

Fillmore, bet. McAllister and Fulton. Two-story frame.
O.—H. A. Cline.
A.—E. R. Swain.
C.—H. Conrad.
$4,800.

Fulton, cor. Baker. Three one and one-half story frames.
O. and B.—T. H. Day.
Day work.
$4,500.

Fair Oak, bet. Twenty second and Twenty-third. Two two-story frames.
O.—Mrs. Fogerty.
C.—Jas. Fogerty.
$4,000.

Fifteenth, bet Valencia and Mission. Additions to church.
O.—Third Congregational Church.
C.—Farrell & Bell.
$10,000.

Folsom, bet. Twenty-fifth and Twenty-sixth. Two-story frame.
O.—W. H. Wiester.
A.—Copeland & Banks.
C.—Commary & Beardslee.
$9,000.

Fifth, bet. Harrison and Bryant. Alterations.
O.—H. Costa.
A.—C. J. L. Devlin.
C.—H. Schotter.
$1,295.

Franklin, bet. Washington and Jackson. Two-story frame bas ment and attic.
O.—Wm. Haas.
A.—P. R. Schmidt.
C.—McCann & Riddell.
$15,500.

Folsom, bet. Twenty-fifth and Twenty-sixth. Two-story frame.
O.—H. T. Kellum.
Day work.
$3,500.

Franklin, cor. Jackson. Two-story frame.
O.—W. Martin.
Plumbing and slating contracts let.
$5,200, additional to amount given last month

G

Greenwich, bet. Jones and Leavenworth. Two-story frame.
O.—Mrs. Jane H. Hemenway.
A.—S. W. Hemenway.
C.—A. Flood.
$3,800.

Grove, nr. Van Ness Two one-story frames.
O.—I. Harris.
C.—J. H. McKay.
$1,800.

Golden Gate Avenue, bet. Hyde and Larkin. Two-story frame addition.
O.—O'Brien Bros.
C.—H. Keenan.
$1,000.

Guerrero, cor. Eighteenth. Three-story frame.
O.—A. Hayward.
A.—Pierey & Hamilton.
C.—J. B. Gunyear.
$8,800.

Gough, bet. Ellis and O'Farrell. Two-story frame.
O.—H. Lynch
A.—T. J Welch.
C.—W. H. Whickersham.
$7,000.

Geary, bet Gough and Octavia. Two-story frame.
O.—Mrs. C. Callaghan.
A.—C. I. Havens.
C.—F. W. Kern.
$6,500.

Geary, bet. Taylor and Mason. Three-story frame.
O.—C. Afflerbach.
A.—J. Marquis.
C.—S. Hatfield.
$5,000.

Grove, bet. Steiner and Fillmore. Two-story frame.
O.—Mrs. Louisa I. Amos.
A.—S. & J. C. Newsom.
C.—Geo. A. Emburg.
$5,000.

H

Harrison, cor. Park Avenue Additions.
O.—Mrs. H. Hugg.
C.—D. F. McGraw.
$2,000.

Haight, bet. Steiner and Pierce. Two two-story frames.
O.—R. McElroy.
A.—J. Marquis.
C.—M. Murry.
$10,000.

Harrison, cor. Sixth. Three-story frame, four stores and six flats.
O.—Wm Bryan.
A.—H. T. Bestor.
C.—C. H. Ackerson.
$25,000.

Barrison, cor. Rincon Place, Rincon Hill. Additions and alterations.
O.—Baron Von Schroder.
A.—T. J. Welch.
C.—J. Blake.
$16,000.

Hayes, cor. Laguna. Reported last month.
O.—L. M. Fabry.
Carpenter work—H. Mayn.
$8,000 additional to last month's report

Howard, southeast cor. Moss. Three-story frame and brick basement.
O.—J. Hintz.
A.—Miller & Armitage.
C.—B. Dryer.
$9,400.

J

Jackson, cor. Pierce. Three-story frame.
O.—A. N. Drown.
A.—Curlett & Cuthbertson.
Plumbing contract let.
$1,500.

Jackson, northwest cor. Pierce. Two and one-half story frame
O.—D. W. Loring.
A.—W. F. Smith.
C.—F. W. Kern.
$10,000.

K

Kentucky, nr. Sierra. Two-story frame.
O.—J. Chassem.
A.—D. Salfield.
C.—B. Dryer.
$5,000.

L

Lake, bet. Second and Third Avenue. One and one-half story frame.
O.—Mrs. M. Uhrig.
C.—S. Hatfield.
$1,800.

Lily Avenue, bet. Gough and Octavia Additions.
O.—F. & B. Bernon.
A.—Townsend & Wyneken.
C.—J. T. O'Brien.
$500.

M

McAllister, cor. Broderick. Four two-story frames.
O.—A. Drucker.
A.—J. M. Curtis.
C.—J. W. Wessenger.
$10,300.

Merchant, cor. Battery. Alterations.
O.—Hilderbrand & Posner.
A.—J. J & T. D. Newsom.
C.—H. Bray.
$3,200.

Mission, bet. Twentieth and Twenty-first. Three-story frame.
O.—Wm. McCafferty.
A.—A. J. Barnett.
C.—A. G. Fitzpatrick.
$10,500.

Market, cor. Franklin. Additional contracts.
O.—John Nightingale.

Glass—F. H. Rosenbaum,	$2,525
Sidewalk lights—Mahoney Bros.,	2,469
Sheet metal—Jos. Forderer,	1,625
Painting— — Smith,	2,200
Total	$8,819

Mission, bet. Third and Fourth. This building reported last month; four-story brick.
O.—H. Meese.
A.—Miller & Armitage.
Iron work, plumbing, etc.
$5,000.

O

Oak, bet. Gough and Octavia. Alterations.
O.—F. & B. Bernon.
A.—Townsend & Wyneken.
C.—J. T. O'Brien.
$1,000.

P

Pacific, bet. Webster and Fillmore. Two-story frame.
O.—G. H. Hooks.
A.—G. A. Bordwell.
C.—Ingerson & Gore.
$3,500.

Pacific, nr Mason. Additions.
O.—H. Williams.
Day work.
$1,200.

Pacific, cor. East. Two-story frame.
O.—A. Vollmer.
A.—W. H. Wharff.
C.— — Tarr.
$2,000.

Point Lobos Avenue, bet Eighth and Ninth Avenues. One-story frame.
O.—C. S. Nathan.
C.—C. Sanborn.
$2,000.

Pine, bet. Broderick and Baker. One and one-half story frame.
O.—H. Welzer.
C.—T. V. Steinmann.
$2,200.

Post, bet. Pierce and Scott. Two-story frame.
O. and B.—J. C. Wier.
Day work.
$6,500.

P Street, nr. Thirteenth Avenue. South San Francisco. Two one-story frames.
O.—D O'Leary.
A.—J. H. Humphreys.
C.—F. P. Heald.
$2,000.

Pine, bet. Polk and Van Ness. Alterations.
O. and B.—O. S. Warriner.
A.—W. H. Wharff.
Day work.
$1,500.

Park Avenue Road. One and one-half story frame.
O.—Frank Loane.
A.—Pissis & Moore.
C.—Moore Bros.
$2,500.

S

Sutter, cor. Jones. Six-story frame and brick basement. Family hotel.
O.—A. Baker.
A.—J. H. Littlefield.

Carpenter—R. Smith,	$91,500
Brick work and excavating—Pierce & Burnett,	9,800
Plumbing—Sweeney & Kearns,	17,777
Plastering and deafening—C. Dunlop,	16,000
Painting—Jos. Larsen,	7,000
Patent chimneys—L. E. Clawson,	5,800
Cost,	$148,807

Sutter, bet. Kearny and Dupont. Additions and alterations.
O.—A. Hayward.
A.—Percy & Hamilton.

C.—W. Hall,	$19,300
Brick work—J. McCarthy,	6,048
Total cost,	$50,000

Seventeenth, bet. Valencia and Guerrero. Two-story frame. Two flats.
O.—Mrs. Matilda Hunt.
A.—E. John.
C.—J. Klien.
$3,750.

Sutter, cor. Franklin. Alterations.
O.—M. Brown.
A.—P. R. Schmidt.
C.—Degan & Orford.
$2,200.

Shotwell, bet. Twenty-fifth and Twenty-sixth. One-story frame.
O and B.—C. O. Smith.
Day work.
$2,000.

Steiner, nr. Oak. Two-story frame.
O.—Mrs. M. G. Day.
A.—S. & J. C. Newsom.
C.—J. Rebman.
$4,000.

Stevenson, nr Twentieth. One-story cottage.
O.—M. Bluerson.

O.—J. Carroll.
A.—J. J. Clark.
C.—Doyle & Son.
$2,800.

Washington, bet. Polk and Van Ness Two-story frame and brick basement.
O.—H. W. Hyman.
A.—P. R. Schmidt.
C.—K. Sent.
$11,500.

MISCELLANEOUS.

Oakland—One-story brick. O., A. Michel; A. and B., W. H. Wharff; day work; $3,0 0. Cor. Brush and Thirteenth. Two-story frame. O., A. Rowe; A., J. J. & T. D. Newsom; C., Knight & Littlefield; $7,500.

Gilroy—One-story frame. O., R. Graef; A., Jacob Lenzen & Son; C., J. J. Dorland; —$2,200.

Niles Station—One-story frame. O., California Nursery Co.; A., Jacob Lenzen & Son; C., J. D. Egan; $1,550.

San Jose—East side First bet. San Fernando and San Antonio. O., E. Auzerais; A., Theod re Lenzen; C., Thos. Livingston; cost,—$14,000—instead of $1,400, as reported last month. East side Market bet. Santa Clara and St. Johns. Two-story brick. O., G. Fromis; A., Theodore Lenzen; C., R. Summers; $6,500. South side Santa Clara bet. Orchard and Vine. Two-story frame. O., Mrs. E. Buhot; A., Theodore Lenzen; C. J. McIlvain; cost, $1,500.

Healdsburg—Methodist Episcopal Church. A., T. J. Welch; day work; $15,000.

HILL'S PATENT INSIDE SLIDING WINDOW BLINDS

Are Adapted to Any Style of Window

And Suitable for all Buildings, Dwellings, Stores, Office Buildings, and for Houses Built to Rent, Boarding or Lodging-Houses are Unexcelled.

THEY are entirely inside of the window casing, and while requiring no furring out or boxing, make it an impossibility to tear curtains, interfere with plants or window ornaments, or become broken by contact with chairs or other movable articles.

The light can be admitted and sunlight excluded from any part of the window; can be instantly removed and taken to any part of the house to clean, and as easily replaced.

They can be opened or closed with the window raised, and without removing articles from the window-sill, and cannot blow open or rattle. The Blind is very light (one-half inch in thickness) and strong, possessing more durable qualities than a hinged blind one inch in thickness.

There is NO SAGGING, BANGING, OR GETTING OUT OF ORDER!

They are made in three sections in height (each section sliding past the others), and any number of divisions in width corresponding to the folds in the old-fashioned folding blinds. They require NO HINGES—all trimmings furnished with blinds—are MADE OF ALL WOODS, finished or unfinished, and COST LESS than old-style folding blinds. They have been extensively used by the best architects and builders throughout the East and West, and have given perfect and entire satisfaction wherever introduced.

The following are a few of the owners who have adopted the HILL BLIND in preference to any other:

U. S. Government, four sets officers' quarters, Presidio Res., S. F.; H. F. Bruns, cor. Geary and Taylor, S. F.; J. C. Weir, Post, near Scott, S. F.; John MacKenzie, cor. Grove and Broderick, S. F.; L. H. Sweeney, San Rafael; R. B. Gray, cor. Pacific and Van Ness, S. F.; Raymond Hotel, 1,600 windows, Pasadena, Cal.

ENGLISH AND AMERICAN VENETIAN BLINDS

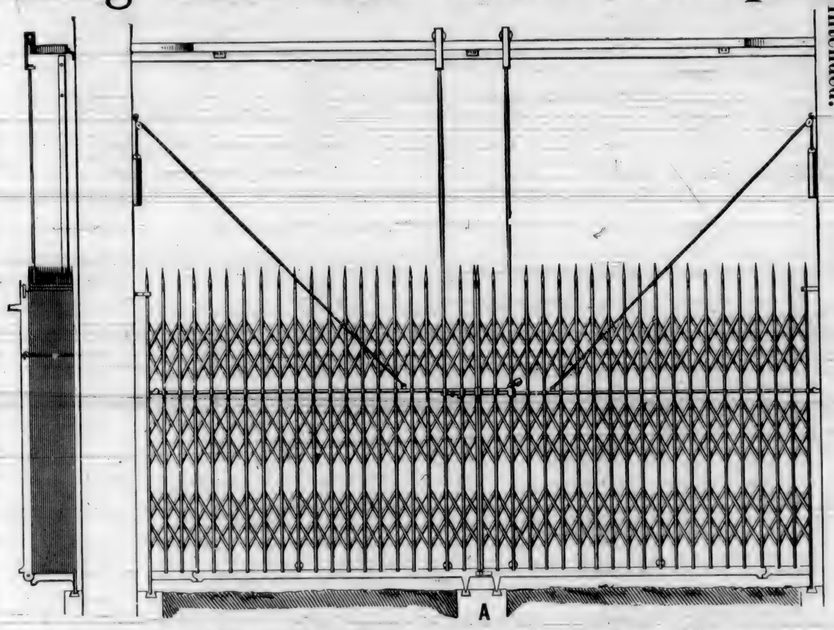
IMPROVED.

The only Perfect Venetian Blind in the market. For samples, prices and information, address,

EDWARD B. HINDES, Agent, 330 Pine St., Room 55.

Folding Gate and Guard Company.

These Gates and Guards are manufactured to order in San Francisco, to fit and fill openings as desired. Descriptive Catalogues and Price List furnished.



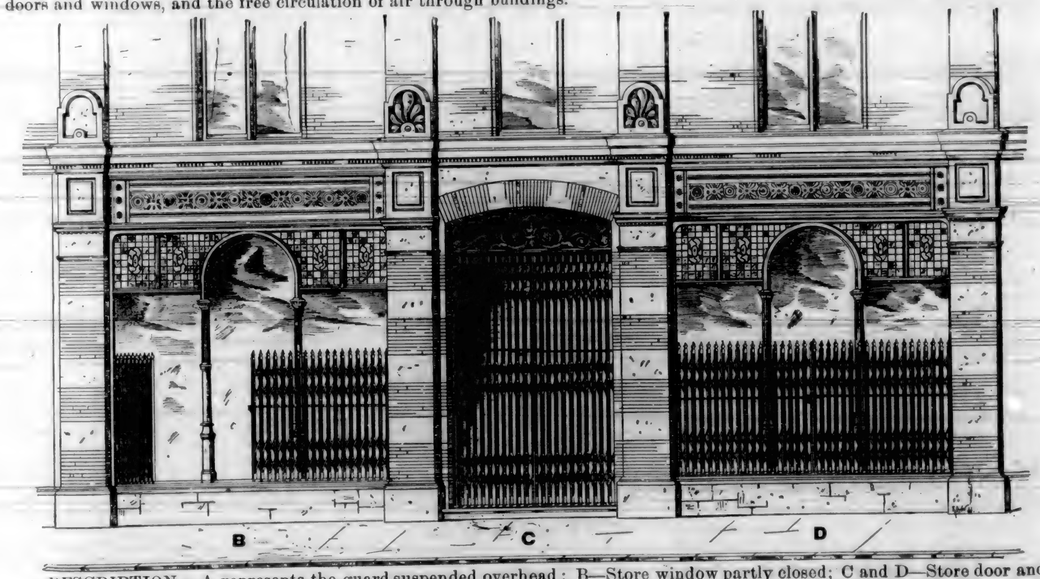
ABSOLUTE SATISFACTION GUARANTEED.—They are easily handled and adjusted, and are the most perfect device in use for the purposes for which they are intended.

Protect Your Homes and Business Houses

WITH * THE * IRON * FOLDING * GATES * AND * GUARDS.

They are ornamental in design, and afford perfect security when applied to store doors and windows—to vestibules, doors and windows of dwellings, and at stables, elevator wells, etc.

When in position they are an absolute safeguard against **Burglars, Thieves, Tramps and Designing Persons,** and can be removed and replaced without unhinging. As a **Sanitary Device** they are superb, permitting the opening of doors and windows, and the free circulation of air through buildings.



DESCRIPTION.—A represents the guard suspended overhead; B—Store window partly closed; C and D—Store door and window fully closed.

CEO. H. RICE, President. **E. J. ROBINSON, Agent,** 109 California Street, San Francisco, Cal. **J. P. LECOUNT,** Secretary.

The California Architect and Building News.

VOLUME VII. ENTERED AT POST-OFFICE, SAN FRANCISCO, AS SECOND-CLASS MAIL MATTER. ESTABLISHED JANUARY, 1879. NUMBER 8.

THE

California Architect & Building News.

A MONTHLY JOURNAL,

Devoted to Architecture, Decorating, and Furnishing.

PRICE, $2.00 PER ANNUM.

The official organ of the Pacific Coast Association of Architects. Published by the SAN FRANCISCO ARCHITECTURAL PUBLISHING CO. No. 240 MONTGOMERY STREET, Rooms 11, 12, 13.

Subscribers will please notify us promptly of any failure to receive this journal, and also of any change in their address.

Advertisements inserted at reasonable rates.

SAN FRANCISCO, CAL., AUGUST 10, 1886.

Building Summary.

AS will be noticed by our monthly report, the number of contracts let since our last issue is considerably less than those for the similar period of 1885. How far the G. A. R. Encampment may have contributed to this result, is a matter of conjecture. One thing is certain, that the encampment business engrossed the attention of a large number of our citizens, and business generally was greatly affected by it.

REPORT FOR AUGUST, 1886.

64 frame buildings, value	$376,431
8 alterations and additions, value	12,950
72, total number of engagements, total value	389,381

REPORTED IN AUGUST, 1885.

95 engagements of the value of	395,150
August report, 1886, less than 1885	5,769

The Offered Sale of This Journal.

SINCE the first announcement in its pages that the entire interests of this journal would be disposed of to competent parties, a great many personal inquiries have been made, and propositions submitted and declined.

A sale contingent upon certain stipulations might have been made a month ago, but as we propose an *unconditional surrender* of the situation, we shall *hold the fort* until a competent *commander-in-chief* shall arrive, with satisfactory *financial credentials.*

Negotiations now pending with parties and firms east of the Rocky Mountains, may result in a full change of management by the first of January next, if not sooner. In the meantime the journal will be continued as heretofore to the best of our overburdened abilities.

A GENERAL EXPLANATION.

Those who have made inquiry by letter, and personally, have asked for all the facts of the case, and what will be included in the sale.

As a general answer, we state: A sale will include every interest of the publication,—its good-will, subscription list and advertising patronage, office appointments, desk, bound volumes and back numbers since 1879, outstanding accounts due from all sources, five hundred copies, more or less, architectural, mechanical, and other publications (optional), and all else pertaining to the publication and circulation of the journal.

We state, in answer to the question repeatedly asked by correspondents, in reference to

COMPOSING ROOM AND PRESSES,

That there are none. The journal has been conducted *incidentally* in connection with our architectural pursuits, and printed and bound ready for distribution by contract.

But with these limited facilities and restricted advantages, and personal attention divided between two great interests—editor and manager, and practicing architect—each demanding our whole time and energies, we have continued our publication work for eight years (less four months) with a profit to ourselves, making a most enviable reputation for the journal, as evidenced by the hundreds of complimentary notices from time to time published by technical, class, and other journals, and preparing the way for some one to continue its publication with great success and profit.

G. A. R.

THE Twentieth Annual Encampment of the Grand Army of the Republic, held in San Francisco, has been a grand affair, meeting the highest expectations of the home guards, the citizens of the Pacific Coast, and the visiting host from all quarters of the United States.

But our daily contemporaries of this city have so fully and elaborately chronicled all matters pertaining to this great and ever-to-be-remembered gathering of patriotic men and women, that anything on our part, more than a mere notice of the event, is unnecessary.

One remarkable feature, however, is worthy of special mention; that while the number of men, women, and children moving to and fro through the streets of San Francisco, entering and leaving the city by trains and ferries during the period of the encampment, aggregated hundreds of thousands, approximating 2,000,000 persons, not a single accident to life or limb has occurred in connection therewith.

Aggregating the number of trips of street-cars during each day, from 3,000 to 4,000 cars were moved daily, or for the week, some 25,000 to 30,000 trips on all the lines—perhaps more—yet the accidents reported in this connection do not reach the average of such happenings during ordinary times. This is the more remarkable in view of the fact that Market Street was "swarmed all day long" with the living masses, and parts of each day hundreds of cars passing a given point each hour; while at the Pavilion, on several occasions, the Larkin street-cars were run through surging crowds, and at the park terminus, frequently from one to two thousand people at the same moment transferring to and from cable to steam-cars, or in and out through the entrances to the park. Yet under all those risky conditions, the week passed without leaving any sad and mournful monument of sorrow to mar the pleasures which seemed to flow in all directions.

The Circus Style.

CIRCUS in this sense—that a circus is a place that offers to the public a variety of funny things, as well as a few instructive and pleasing features, and the more really funny the entertainment, the better it draws, consistency being but incidental in its make-up.

In this view of the case—true merit and pure architectural rules and principles aside—the numerous clownish structures erected in San Francisco and elsewhere, are so thoroughly funny in general appearance, effect, and detail, that every intelligent architect or competent architectural critic can but laugh at the endless contortions, distortions, ill proportions and abominations set up to public gaze, and the whim of prevailing taste with those who seek and accept these structural mal-formations, are something astonishing.

The modern idea of house-designing, in the hands of competent and artistic architects, has, in some cases, evolved neat and pretty delineations. But the liberties possible under the false guise of Eastlake have also made it possible for consummate pretenders to operate, and conceal and disguise their ignorance of true principles, and practice their abominations under the pretext of a fancy name, used to excuse error, and gull clients to accept ignorance and incompetency as a style of architecture.

There can be no objection to any neat, consistent, and meritorious departure from the old order, in which symmetry, proportion and good taste has been respected and blended. The progressive age in which we live, not only commends but invites inovation upon the forms and features which have held the world subjugated to the creations of the ancients. Beautiful and to be admired, the grand old structures the world over stand as exemplifications of that depth of conception which evolved the classic orders, and will so stand until the curtain of time is rung down at the close of all human existencies, and the consuming flames lick up every vestige of human thought, and crumble into ashes the last evidence of human—architectural—skill, if such an event shall ever transpire.

But in architecture, time must work, and has worked, changes, and those possessing true merit and excellence will become renowned and admired, and be placed side by side with those of the early ages; but the nondescripts passed off under the name of Eastlake—meaning any structural abomination, however erroneous, as well as those of modest neatness and pleasing appearance—can exist only as remembrances of the freaks of fancy of the period, to be looked upon in future years as most singular exhibitions of the reckless corruptions tolerated in the latter periods of the nineteenth century.

This is none too severe criticism, as much that is now practiced is defenseless upon any hypothesis of refined ethics, good taste, convenience, or consistent form, and in details innumerable, fearfully at variance with rational comparison with anything in true art or nature, and inclining in harshness and hideousness in general effect, to structures among barbarous races, or the semi-civilized and idolatrous nations.

In many of the examples the ill-shaped lines and inconsistencies are positively repulsive to the eye of those who have studied the beautiful from forms, as handed down to present generations through successive ages; yet there is at the present time a too general disposition to favor extravagancies in house designing, as in all other things, and to recognize as good the wildest imaginations and concepts of men, who in the attempted pursuit of classic architecture would fall to the deepest depths of obscurity.

Life of Cast-Iron Pipes.

THE fact is well sustained that the wear, by rust, in uncoated cast-iron pipe exposed to the action of clean, fresh water on both sides, is not more than one-eighth of an inch in three generations. With the present method of protecting such pipe with asphaltum, the life of the ordinary cast-iron pipe, used in building construction, may be greatly prolonged; indeed, even an ordinary coating of coal-tar pitch, when properly applied, is sufficient to add at least a score or two of years to its durability. The life of a soil pipe, even when quite thin and uncoated, has been found, by experience to be so great that it is not unreasonable to suppose that the greasy matter contained in sewage serves to coat and protect the iron from the corrosive action of the water and the acid components of the sewage.

The defects and leakages more generally met with in such pipes, are caused by the defective manner in which the joints are made, and improper placing and securing. Materials and devices used in buildings are often made to bear the faults of bad workmanship, and frequently "tearing to pieces" is done under the presumption that the things torn out are worthless, or not good, while the real difficulty lies in the defective handling and fitting.

Copper Boiler Explosion.

THE explosion of a copper boiler, in the kitchen of the Winchester House, in this city since our last issue, by which human life was jeopardized, and property damaged to the value of nearly $2,000, was an occurrence of infrequent happening.

The possible explosion or collapsing of copper boilers connecting with ranges or stoves, is a matter well understood among plumbers and competent architects, and as a rule, precautions in the shape of tanks and steam pipes are applied in all such cases, and when sufficient and properly connected, there can be but little danger of either collapsing or explosion, even if the sheet metal of the boiler is light. Consequently the fact that a copper boiler did explode in the kitchen of the house named, is *prima facia* evidence that the vent—the "steam pipe,"—was too small, was trapped, or choked by corrosion or otherwise. To produce an explosion by steam, the vapor must be confined and accumulate until its force becomes greater than the resistance afforded by the vessel or chamber in which it is bound. An insufficiency of water alone would not cause an explosion in any case where a vent was applied capable of carrying off all excess of power in the steam beyond the strength of the holder. Hence it is fair to conclude that the cause of the explosion was the absence or obstructed condition of such proper vent or escape. There might have been but a fractional part of the quantity of water required to fill the boiler, and no explosion occurred, if there had been a sufficient escape for the steam produced by the water passing through the water-back. The boiler may have been constructed of light material, but that fact alone would not have been sufficient to produce the explosion, if the precaution against the result had been free and of sufficient size.

The fact that the boiler was thrown to a great height, and the building construction in which the accident happened demolished, proves that there was a considerable accumulation of steam in the boiler, and that it was so bound as to obtain a force beyond the resisting and retaining capacity of the shell in which it was held.

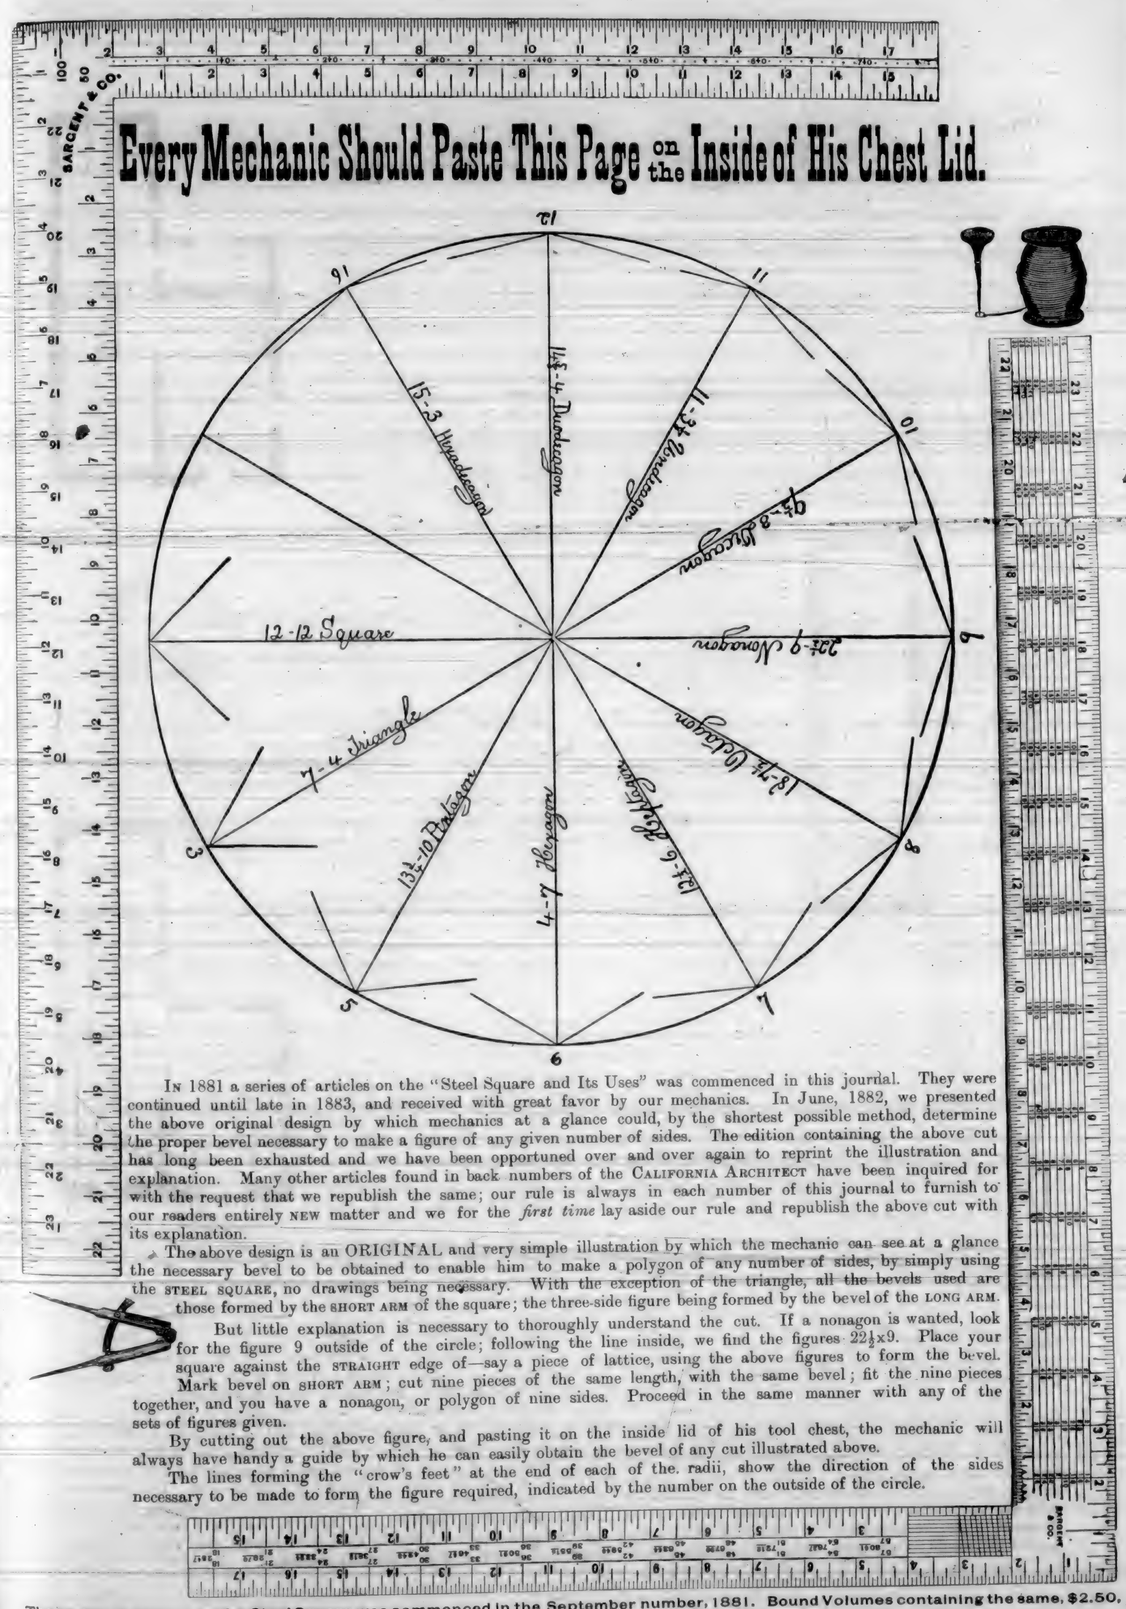
The lesson to be drawn from the case under review is, that vent pipes—of sufficient capacity to boilers are most important and necessary adjuncts, and that they should be kept free from corrosion or stoppage of any kind.

A second lesson suggests itself to manufacturers of boilers, and plumbers, not to make or use those of thin metal. Had the boiler in question been a little heavier, say five dollars' worth more of copper in the weight of the sheet-metal, the accident would not have occurred just when it did, and might not have happened at all. The repeated and frequent draining of water for dish-washing and kitchen purposes, after meals, the time when the explosion in question occurred—just after breakfast—when the fire in the range was less than it had been in cooking the meal, clearly indicates that there was a chokage in the vent pipe, terminating as stated, in the explosion of the boiler, loss of a sum in damages to property sufficient to build a neat little homestead for a family, and the severe scalding of one of the helps, and some injury to others.

STAINING MARBLE.—The art of staining marbles in a permanent manner has long been lost, but an American has rediscovered the process or discovered a new one equally effective, so that it is now possible to paint a marble surface with pigments which sink into the substance of the stone to any desired depth and then to polish the surface as highly as before the marble was treated.

ACID PROOF CEMENT.— A cement for resisting sulphuric acid even at boiling heat may be made by melting caoutchouc at a gentle heat and adding, with constant stirring, from six to eight per cent of tallow. Then mix therewith enough dry slaked lime to make the whole the consistency of soft paste; finally, add thereto about twenty per cent of red lead, whereby the mass immediately sets hard and dry. A solution of caoutchouc in twice its weight of linseed oil, aided by heating, and the addition of an equal weight of pipe-clay, yields a plastic mass which will likewise resist most acids.

SHINING BLACK INK.—The best shining black ink, used for mourning paper, and the manufacture of which has up to the present time been kept a secret by the makers, may be prepared, according to the *Papier Zeitung*, of lamp-black, borax, and shellac. The ink is made as follows: In one liter of hot water sixty grams of borax are dissolved, and to this solution three times the quantity of shellac is added. After this mixture has been properly dissolved, the necessary quantity of lamp-black is added, the whole thing being constantly stirred. Should the luster not be satisfactory, more shellac is added.



IN 1881 a series of articles on the "Steel Square and Its Uses" was commenced in this journal. They were continued until late in 1883, and received with great favor by our mechanics. In June, 1882, we presented the above original design by which mechanics at a glance could, by the shortest possible method, determine the proper bevel necessary to make a figure of any given number of sides. The edition containing the above cut has long been exhausted and we have been opportuned over and over again to reprint the illustration and explanation. Many other articles found in back numbers of the CALIFORNIA ARCHITECT have been inquired for with the request that we republish the same; our rule is always in each number of this journal to furnish to our readers entirely NEW matter and we for the *first time* lay aside our rule and republish the above cut with its explanation.

The above design is an ORIGINAL and very simple illustration by which the mechanic can see at a glance the necessary bevel to be obtained to enable him to make a polygon of any number of sides, by simply using the STEEL SQUARE, no drawings being necessary. With the exception of the triangle, all the bevels used are those formed by the SHORT ARM of the square; the three-side figure being formed by the bevel of the LONG ARM.

But little explanation is necessary to thoroughly understand the cut. If a nonagon is wanted, look for the figure 9 outside of the circle; following the line inside, we find the figures 22½×9. Place your square against the STRAIGHT edge of—say a piece of lattice, using the above figures to form the bevel. Mark bevel on SHORT ARM; cut nine pieces of the same length, with the same bevel; fit the nine pieces together, and you have a nonagon, or polygon of nine sides. Proceed in the same manner with any of the sets of figures given.

By cutting out the above figure, and pasting it on the inside lid of his tool chest, the mechanic will always have handy a guide by which he can easily obtain the bevel of any cut illustrated above.

The lines forming the "crow's feet" at the end of each of the radii, show the direction of the sides necessary to be made to form the figure required, indicated by the number on the outside of the circle.

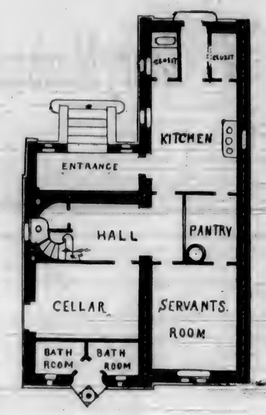
The series of articles on the Steel Square was commenced in the September number, 1881. Bound Volumes containing the same, $2.50.

Floor Plans for a Seaside Cottage.

THE accompanying engraving represents the plans for a building to be erected near the seashore. One of the first things to be thought of in designing houses to be built near the water is the arranging of the various rooms in such a manner that perfect light and ventilation are secured without the windows being too much exposed to the fury of prevalent storms, or the regular blow of trade winds. This fact has been carefully kept in view in the plans as presented on this page.

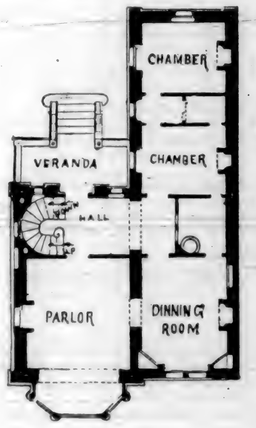
Another fact must be kept in view: Such houses as the one illustrated must be provided with suitable bath and dressing-rooms, handy of access from the beach. By examining our first-floor plan, it will be seen that two such rooms are provided for. They are directly in front of the intended building and can be entered very easily. The front, as shown, faces the sea, the main entrance being in the rear. Following out the suggestion given above, no windows have been placed on one side of the building, thus presenting a blank surface to the fury of the storm which may happen to rage. The plan may be reversed so as to have said wall face any point of the compass and still carry out the general design shown.

The arrangement of the first story will commend itself especially to those who find it inconvenient to have servants around among the living rooms. Ample accommodations are found in this floor for all kitchen work. By the means of a dumb waiter, the meals, after being cooked, can readily be transferred to the dining-room; a large cellar affords ample room for the storing of coal, vegetables, etc., while the servants are provided with a fine front room, with a beautiful room.



FIRST STORY

Via parenthesis, we may remark that one of the principal reasons why servant girls are so hard to keep in one place is the insufficiency of their bedroom accommodations. They are put anywhere, and often sleep in rooms in which the sun never shines. This is radically wrong; servants are hard-working people, and nature demands that they should have proper rest and well-ventilated rooms. There are already too many houses in which the servant's room opens directly out of the kitchen; consequently the room is filled with the smoke and fumes arising from the cooking; the bed clothes, etc., are permeated with the noxious vapors, and when the weary servants retire for the night, they are compelled to breathe the same kind of *greasy* air that is inhaled during the day. The result is a few months' stay in one place and then a change. By all means, ladies, see that your houses are so planned that the servant can have a sunny room.

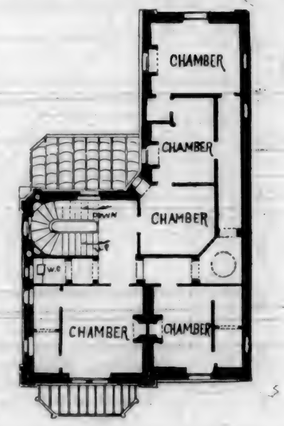


SECOND STORY

Ample bedroom is provided for a family of at least eight persons, and by *doubling up* in the beds, many more can be provided for. Should an attic be wanted, the stairway can be carried up similar to that shown on third-story plan. The rear portion of the attic could be fitted up as an observatory, with the telescope, etc. Children living in such a house could thus be early taught the rudimentary principles of astronomy. The front portion of the attic would make a fine billiard room, leaving ample room between stair hall and observatory for a children's play room.

While the arrangement as shown will not be acceptable to many, it must be remembered that a sea-side cottage is not intended for a permanent residence. Compactness with ample accommodations; every convenience and yet only a moderate outlay of money; these two facts must be well borne in mind when planning a house of the character shown. Being away from a town, no water pipes are indicated, nor gas pipes marked; to those wishing to go to the expense, an artesian well and windmill and pump complete will supply the one, and a gas machine the other.

The front elevation we do not give. This may be varied to suit the tastes of those building. We have only endeavored to present the general plan of the house, leaving it to an architect to supply the balance of the drawing. A house of the character shown can be built in this section of the country for any amount from $5,000 upwards, depending greatly upon the accessibility of the different materials required in its erection.



THIRD STORY

Painting Floors.

NOW that the fashion is more and more prevalent of using carpets th t do not completely cover the area of the floor, and which thus escape distortion by being so cut as to coincide with every angle, recess, or curve of the walls, floor painting should certainly be more generally adopted. Painted borders are all well enough, but the whole area of the floor may be advantageously laid out in color. This painting necessarily involves priming, which, in itself, as applied to floors, is hygienic, as having the effect of closing the pores in which dust lodges, the dust, with its darkening and forbidding effect, never failing to obtain lodgment unless, indeed, the boards should be of costly hardwood, which is the exception, not the rule. It may be said that a floor painted all over will not be seen. but, without replying that a painted border where the whole area is not colored is a deception, we may remark that the entire treatment of a floor or cover affords a security against unsightliness should any portion of the central carpet be accidentally raised, and that in the event of its removal for purposes of cleaning the painted ground suffices, more especially if enriched with a few rugs or tinted or patterned mats.

In the hot summer months a floor artistically painted will be often found preferable to carpet, as aiding in the movement of the air, not harboring dust, and proving on the whole cooler. Paint may be so compounded and laid on floors as to suffer but little injury, even when exposed, in a long course of time. Should the colors become dull, a slight varnishing will suffice to renew much of their pristine freshness. There are many rooms in a house which would be all the better for not being fully carpeted. Such especially are bedrooms. When we speak of painting a floor we do not refer to giving it a uniform hue. The handsome designs carried out in encaustic tiles may be repeated in color. Geometrical figur s centered with small leaf patterns are peculiarly appropriate; so, too, a host of fresco patterns, these being varied in successive tiers. Longitudinal lines representing the chromatic scale of colors might be repeated at certain intervals. Diagonal lines in different hues, lying thwart each other, in basket-work style, would have a good effect. The borders, as a matter of course, should be differently treated.

DOVETAILING.

THE art or mechanical science of dovetailing consists in fastening boards or timbers together by letting one piece in the form of a *dove's tail spread*, or wedge reversed, into a corresponding cavity in another, so that it cannot be drawn out. The mere fact that a mechanic can explain what a dovetail is, does not imply that he is therefore fully acquainted with all the mechanical skill necessary to perform the operation required with artistic ability. Practice alone, with a careful attention to details, is the main requisite necessary to perform a neat and accurate joint.

Again the mechanic must study; because he has practiced enough to enable him to make joints hardly discernible to the naked eye, is no reason why he must consider himself as perfect. He must have a thorough conception of the proportion which a piece made to fit into another should have toward that into which it is fitted, so as to produce the greatest strength with the least possible waste of material. He must also know how to proportion a joint so that it shall not fail or give way before another.

It is in the latter particular why so many joints made by the most skillful workmen separate with a trifling strain, or from being bound too tightly together, fly and split in all directions. This is owing to want of study on the part of the mechanic, as he is lacking the information necessary to estimate the strength required to resist the stress on the joint.

In Fig. 1 we represent the common dovetail. The projecting ends are called the *pin* of the dovetail, and the aperture into which this pin is fitted is called the *socket*. The form shown is the strongest of all the various patterns, and is used in tool chests, backs of drawers, and in places generally where strength is considered of more utility than beauty.

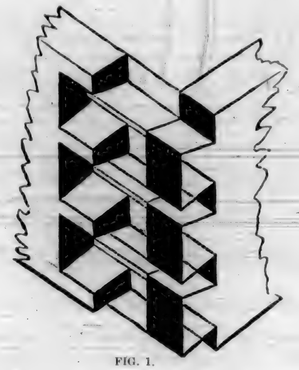


FIG. 1.

In laying out the dovetail, it is best to allow the pin to be a little long, so that after the work has been put together, the projections can be smoothed off with the plane, thus making a clean surface.

The strength of the joint depends on the *form* of the dovetail, as well as on the proportion it bears to the parts cut away. No absolute rule can be given for the bevel of the *pin;* in ordinary work an angle equal to about 75° or 80° is that usually employed. To those who do not understand how to obtain the angle required, we would say, take a pair of compasses and scribe a circle; draw two diameters at exactly right angles to each other; the arc of the circle will thus be divided into four parts, each equal to 90°; divide the arc of one of these sections into five equal parts; draw a line from the center of circle to the point nearest the perpendicular; this line in relation to the diameter will give the bevel necessary for the *pin* of the dovetail.

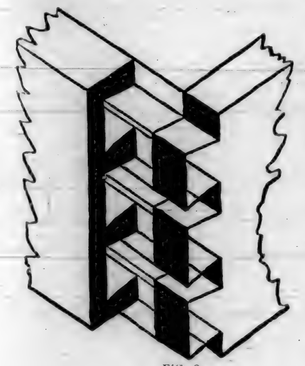

FIG. 2.

Young mechanics are apt to allow too great a bevel for the *pin*. This fault must be carefully guarded against. Too much of a bevel decidedly weakens the joint. The best rule to go by is to study the nature of the wood, and give as little bevel as possible and still prevent the possibility of the pieces pulling apart. Hard or tough wood admits of much greater bevel than redwood or pine.

Fig. 2 represents the *lapped* dovetail. In this form the ends of the dovetail show on one side of the angle only, and is generally used in the front of drawers in cabinets, bureaus, etc., where the side cannot be seen unless the drawers are opened.

Fig. 3 represents the *mitred* or *secret* dovetail. In this the dovetails are not seen at all. While, admittedly, this is the weakest form of all the various patterns, still it is very useful where neatness is required, and is generally employed in making fine boxes, etc., for the parlor or library.

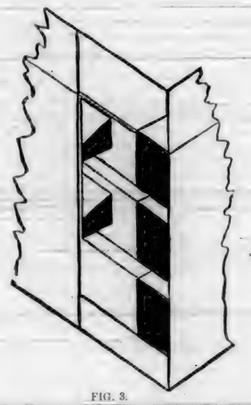

FIG. 3.

As represented in Fig. 4, a tenon may be held tight in a mortise, by framing the latter in the shape of a dovetail, and *fox-tail wedging* the tenon into it; this is done by four thin wedges into and projecting from the end of the tenon, so that on coming in contact with the bottom of the mortise hole, they may be driven into the tenon and enlarge it sufficiently to fill up the dovetailed mortise. Care must be taken to so arrange the wedges that the two outer ones may be driven first, and then the inner ones; by this means only thin pieces of the tenon are split and turned outwards at a time, thus avoiding the risk of splitting the tenon beyond the shoulder, which might occur if fewer and thicker wedges were used. Light blows should be given at first so as to cause the tenon to gradually split.

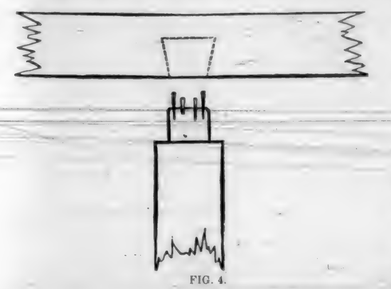

FIG. 4.

The mechanic must have his tools in perfect order. Only dull instruments as well as tools slip over work. If the edges are keen, they will *grab* hold of the wood as if eager to do their part. In fine work it is absolutely essential that the tools be in perfect condition, as a slip of the plane or saw may cause damage which cannot be easily repaired.

Scribing.

SCRIBING is the operation by which a piece of wood-work is made to fit against an irregular surface. Thus, for instance, the base-board of a room, by scribing, is made to meet the unevenness of the floor. To determine just the amount of wood necessary to be removed, take a pair of compasses and open them to a width equal to the greatest distance or space between the base-board and the floor. Having *set* the compass, draw them along the floor so that a mark will be scribed in the board, corresponding to the bumps on the floor. Cut the wood away according to this line, and on refitting the board, a good joint will have been obtained.

A curious flower was recently discovered on the Isthmus of Tehuantepec, Mexico. It has a faculty of changing its color during the day. It grows on a tree. Another peculiarity of this floral chameleon is that it only gives out perfume at noontime. One of the strangest things about this flower, however, is that it should be found in Mexico when its colors are those of the United States flag. In the morning it is white; at noon it changes to red, and at night it adopts a soft blue color.

American Institute of Architects.

We have received a copy of the proceedings of the Institute at its nineteenth annual session, 1886, containing also an expressive likeness of the first president of the Institute (deceased), Richard Upjohn.

The address of welcome was delivered by Dr. Thomas A. Atchinson, which was responded to by Mr. Kendall, in which the following occurs: "Additional associations for the furtherance of professional interests have been formed under most favorable auspices, and we must feel especial gratification in the increased facilities for the study of architecture, which are offered by the Institute of Technology, in Boston; by Architectural Department of the School of Mines of Columbia College, in New York; by the Illinois Industrial University, at Champaign, and by other institutions of learning in various parts of the country, so that the student in America can now obtain a professional training, which will be of greater practical value to him than the architectural courses of Paris, Vienna, or Berlin."

The addresses, containing many interesting references, were listened to with deep attention, and received hearty applause from members and guests. The following extracts from the proceedings indicate the spirit and feelings actuating our professional brethren—members of the Institute:

"It would seem desirable that some effort be made to bring about a closer union and relationship between the architectural associations of this country. To this end it seems but proper that some advance be made by the American Institute of Architects, as the oldest organization of architects on the continent. As a means to that end, it would seem desirable that this Convention take some action looking to a representation through a regularly appointed delegate at all conventions of architectural societies throughout the Union, and that such societies be requested to send each a delegate to all conventions of the A. I. A."

San Francisco Chapter is duly noticed in the report of proceedings.

Matters relating to supervising architects to public works, compensation, competitive plans, etc.; were considered.

A "Bill to establish the office of Commissioner of Architecture, and a Board of Public Biddings, and for other purposes," was presented by the committee previously appointed to prepare such a bill, in which among other things occurs:—

"Section 27.—That any contractor who shall construct the building on which he is engaged in a different way from that prescribed in the plans and specifications, or who shall supply different or inferior material from that called for in the specifications, or who shall cause the work to be done in a manner different from that called for in the specifications, or in his contract, except as provided for in this act, shall, on conviction of such offense, be fined in any sum *not less* than five hundred dollars."

Reference is made to the following "words of our first president, Richard Upjohn, spoken at the convention of 1867. After sketching the early struggles and history of the Institute, Mr. Upjohn said further: 'It is the duty of every one of its members to throw the full force of his abilities and influence, so far as the demands of his first duties toward himself and his dependents will permit, into combined effort to make the Institute attain its object, and realize its noble ideal. If we do so, if we show that we respect our work, and ourselves as its doers, that we know what we mean, and mean to do it, so far as our providential opportunities will permit, if we make what we have done apparent, and show that we have well laid out our plans for the future, and have the men, the intellect, and the culture to carry them out well, we shall find that Providence will not fail us, but will, through the medium of outside co-operations, supply us according to our need and progress with the material means requisite to make our mental capital available.'

"Eighteen years have passed since these words were spoken. The Institute has developed and grown strong under its federal system of united chapters. A bright and useful future seems to be open before us; the art of architecture is more appreciated, and the practical science of building is more generally and better understood. To be members of the American Institute of Architects should be our pride, and an attendance upon its annual conventions a journey of pleasure and profit to all fellows and associates."

The many reports of committees, and speeches by able representatives of the profession, contain a large amount of instruction, and furnish data and facts of great value to those earnest in desires to improve themselves in the practice of a profession time-honored and noble, yet ever challenging the best efforts of the human mind to keep pace with its unfoldings, and ever furnishing new bases of thought, and revealing new beauties through each succeeding generation.

The suggestion expressed, that every chapter in the United States should be represented at the annual councils of the grand body, is a good one, and honored, indeed, will be the man who shall be the first from California to represent San Francisco Chapter and the architectural profession upon the Pacific Coast.

Technical Terms.

Some of the technical terms used in the building trades are very curious, and while many of them have some direct clue as to their derivation and meaning, others possess nothing whatever to show their signification or origin. Technical terms vary to a far greater extent than one would imagine. Even in different sections of the same district one will often find a considerable difference in the pronunciation and manner of spelling technical words; in fact, it is often difficult to determine what the correct spelling and pronunciation should be. An instance of this variation may be found in the word "rebate" in the Dictionary of Architecture, which is therein given, spelt in no less than twenty-three different ways: Rabbet, rarebet, rabbit, rabit, rabbit, and others are given. Other words, equally as well known, vary in as great a degree.

At a recent examination in building construction the following question was given: "Give a short description and sketch, where necessary, explaining the meaning of each of the following terms: 'Tumbling In,' 'Welsh Arch,' 'Dutch Arch,' 'Birdsmouth,' 'Hot Short,' 'Cold Short,' 'Natural Bed,' 'Sandwich Girder.'" Although the terms all refer to well-known features of construction, some of the terms are sufficiently uncommon to render an explanation of their meaning of some interest to our readers.

"Tumbling In" is a term in brick-work used to denote the way in which the courses of bricks are built out of the horizontal when it is wished to reduce the width of a chimney or buttress, or the length of a wall.

"Welsh Arch" is another term used in brick-work, and refers to a bad piece of workmanship. When beams of any considerable thickness are built into walls, when, in fact, they are more than about seven inches in width, a single brick over them will not carry the superincumbent load, and it is therefore usual in good work to turn a ring arch over the end of the beam, leaving a small space around it for the purposes of ventilation. Bricklayers often do not take the trouble to turn a fair arch, but compromise the matter by constructing what they term the "Welsh Arch," which simply consists of a brick splayed at each end, supported on the splayed ends of the adjacent bricks. It need scarcely be added that this construction should not be permitted in any good work.

"Dutch Arch." This refers to another form of bad workmanship of the bricklayer. The strength of this "arch"—there is really not a single quality of the arch about it—lies wholly in the adhesive power of the mortar.

The word "Birdsmouth" has two meanings. First, it is a term used by framers as applied to the joint made at the foot of a common rafter, where it rests upon the wall plate; and, secondly, it is applied to the cutting of bricks where it is necessitated by the corner of a building coming at an acute angle.

"Hot Short" and "Cold Short" are both terms applied to defects or impurities in iron. The presence of sulphur, and, probably, also, magnesium, makes the iron red or hot short, that is, brittle at a high temperature; and the presence of phosphorus and silica, cold short or brittle at a low temperature. Both are serious defects; the latter the more so. These impurities come either from the ore or from the coal and flux used in course of its manufacture, and certain materials are, where necessary, used to remove them, common salt being usually employed for the purpose.

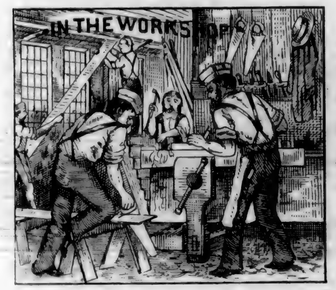
"Natural Bed" is of considerable importance to masons. It refers to the plane of deposit of aqueous or sedimentary rocks. It is very advisable that all such stones should be laid on this bed in order that the stone may the better resist the action of the atmosphere upon it.

"Sandwich Girder" is simply a vulgar name given to the flitch girder, consisting of a beam of wood sawed longitudinally down the center, the two portions being reversed or the faces of the parts previously forming the center being placed outside, a plate of wrought-iron placed between them and the whole well bolted together, forming a strong, light, stiff girder suitable for many positions, and more particularly for loads and positions like those of a breastsummer.—*Artus, in Building.*

Plumbers should be careful not to use lead in contact with oak, unless the latter is perfectly dry and free from sap, otherwise the gallic or acetic acid in the wood will turn the lead into acetate of lead or ceruse.

Front Elevation for a Country Mansion.

The above unique illustration was designed especially for this journal. If surrounded by trees as shown it will present a very striking and handsome appearance. Much depends upon the manner in which it is painted. Rich, warm colors should be used. The arrangement of the porches and verandas is such as to give shelter from the sun in summer and the storms of winter. The cost may be varied anywhere from $10,000 upward. There is no economy in trying to save a few hundred dollars on such a design as that shown. Only the best material and skillful work should be used and employed. Special pains should be taken to have the chimneys built in a substantial manner.



We will be pleased to receive for publication in this column items of information in regard to practical ideas connected with the mechanical part of the building trade. We especially invite suggestions from apprentices and young mechanics.

Do not attempt to peep through key-holes, for in the future disappointment will follow. A new lock is now out, and will soon be on general sale. The key-holes for opposite sides of the doors are out of line with each other, and the locking bolt has two key-bit receiving notches, and there are also special key-hole guarding plates, making a simple but strong lock, not easily picked, and entirely preventing the pernicious habit of peeping through the key-hole.

It is a common idea that a "chimney cannot be too large;" in other words, the larger the area of the flues, the better the draught will be. This is not always the case. In many cases—in foundries, manufactories, etc.—where a chimney has been built large enough to serve for future additions to the boiler power, the draught has been much improved as additional boilers have been set to work. The cause of this is to be found in the increased steadiness of draught, where several boilers are at work and are fired successively, as also in the better maintenance of the temperature of the flue.

One thousand brick, closely stacked, occupy about fifty-six cubic feet.

A cubic foot of good gas, from a jet one-thirty-third of an inch in diameter, and a flame of four inches, will burn sixty-five minutes. Internal lights require four cubic feet, and external lights about five cubic feet per hour. When Argand burners are used, from six to ten feet will be required.

Dry bricks will absorb about one-fifteenth of their weight in water.

A correspondent desires information in regard to seating space in theaters. There is no general rule in universal practice regrading the space to be allowed each person. Boards of Work, Boards of Supervisors, and architects, in different parts of the country, have endeavored to formulate certain dimensions to be used for each individual present in the theater, but when there is a rush, the rules suffer as well as the visitors, in the general squeeze for a place. Generally, the following figures will represent the minimum space to be allowed in the different parts of the house: Width of seat, in dress cicle, eighteen inches; family circle, sixteen inches; orchestra seats, same as dress circle; gallery, fourteen inches. To be comfortable, not less than eighteen inches in width should be allowed for each person. The above measurements apply only to those theaters not using the new-fashioned tip-up seats. Desks used by scholars in our public schools are in length as follows: For two scholars, three feet ten inches long; for one scholar, two feet long. A chair for a scholar five years of age, should be nine and one-half inches high; ten years of age, thirteen and one-fourth inches; fifteen years of age, fifteen and one-half inches; over fifteen years of age, sixteen and three-fourth inches.

In selecting house decorations see that the effect is not destroyed by the surroundings; for instance, when the carpet is faded and the furniture shows many years of faithful service, by no means indulge in bright colors, plush and satin chair scarfs, elaborately embroidered table coverings. Where it is necessary to conceal defects, subdued colors have a more pleasing result.

To Restore Discolored Ivory.—Wash well in soap and water, cleaning out any carving with a small brush, and place while wet in full sunshine. Wet for two or three days, several times a day, with soapy water, still keeping the article in the sun with a glass shade over; then wash again and the ivory will be beautifully white.

We have repeatedly called the attention of carpenters and painters to exercise more care in the building of scaffolds, as they are certain death-traps where improperly constructed. There is scarcely a day but what the papers record the death of either a carpenter or painter, resulting from the falling of a scaffold, and it is certainly strange that these repeated warnings do not have more effect upon the workmen who build them. They not only owe it to themselves, but to their families, and we would urge that it be the duty of the architect, builder, or boss, to thoroughly inspect each scaffold erected. By so doing serious accidents will be avoided.

The houses which sell the quickest are the ones which contain the latest improvements. Improvements are in their very nature such as to add to the convenience and comfort of their possessors. And the old-fashioned portable wash-tub and the cistern, handmaids of the ancient days, were at one time designated "improvements." But the march of progress has not only carried them, but all other kindred household appliances, to the realms of shade, and so in degree the same may be said of everything pertaining to architecture, sanitation, and equipment. From the cellar to the garret whatever conduces to make a well-appointed, finely-equipped, and properly-piped and ventilated house, is that which is rewarded by prompt and profitable returns. And what is appliceable in one sphere of action applies with equal force to all others. Those who are heedless of this are always left behind, and make up the long line of "disappointeds" which strew life's pathway.

To Put an Egg-Shell Polish on Fancy Woods.—Three parts of shellac, one part of gum mastic, and one part of sandarac gum are dissolved together in forty parts of alcohol, and form a beautiful polish, which may be applied with a brush or cloth.

Salt and Digestion.—If a piece of salt is taken into the mouth, the flow of saliva is temporarily increased, though it is not certain that the amount secreted in any given time is any greater than it would have been had no stimulants been used. It has been argued, also, that the effect of salt on the gastric juice in the stomach is the same, and that its use promotes digestion. Some recent experiments, however, on a man who had an artificial opening into his stomach to supply food, which he could not take through the mouth, seems to negative this assumption, and that salt hinders the secretion of the gastric juice and digestion rather than promotes them. If the amount of salt is considerable, digestion almost ceases. Experiments like these have great value, for they help to clear away the superstitions of past ages, which seem to be held by the educated and the ignorant alike.

Steel Nails.—Establishments for the manufacture of steel nails and steel nail plates are on the increase in this country. These nails, it is alleged, are produced much more cheaply than those of iron, owing to the cheaper process—the Bessemer—in preparing the metal, but their grip is less than that of iron nails.

A bill of goods had been sold, and when the proprietor came in he saw the sales book and hurriedly called the salesman: "Did you sell Eiddler this bill of goods?" he inquired. "Yes, sir, I did," was the reply. "How did you sell them?" "On time, sir." "On time! good heavens, young man, why didn't you sell them on eternity, so the account wouldn't be outlawed by the statute of limitations."

Wood Preservative.—Introduce into the pores of the wood the following solution: Mix two parts of gutta-percha with one part of paraffine, heat to liquefy the mixture and apply while hot

A Fine Lubricant.—A good lubricant for fine machinery and one which will not gum or corrode may be obtained by putting pure olive oil into a clear glass bottle with strips of sheet lead; expose to the sun for two or three weeks and then pour off the clear oil for use.

To Polish Glass.—To polish plate glass and remove slight scratches, rub the surface gently, first with a clean pad of fine cotton wool, and afterward with a similar pad covered over with cotton velvet which has been charged with fine rouge. The surface will acquire a polish of great brilliancy, quite free from any scratches.

The heaviest wood known among the four hundred species of trees found in this country is said to be the black ironwood of Southern Florida, which is thirty per cent heavier than water. Sixteen of the species, it is stated, are so heavy that their perfectly dry wood will sink in water.

ASKED, ANSWERED, AND COMMUNICATED.

Ed. Architects, Contractors, Carpenters, and Mechanics generally are respectfully requested to furnish us items of interest for this column. We will gladly answer any and all questions pertaining to the architectural and building interests. If illustrations are necessary to explain your ideas, send us a sketch of them and we will make the cuts.

Los Angeles, Cal., July 21, 1886.

Editors California Architect and Building News—*Gentlemen:* I observe in your July issue some one asks for "correct method of finding the length of one of the sides of an octagon, the diameter being given."

The rule is given, but the writer cannot exactly see into it. Will you kindly, in your next issue, try to explain the rule more clearly, and illustrate or suppose a case where the diameter is less than twelve inches. By so doing you will greatly favor one of your readers. X. Y. Z.

The rule, as given in our July issue, is applicable to any octagon, regardless of the length of side. If our correspondent will read carefully, he will find that the rule says, "*add or subtract, as the case may be, to the known length, two and one-half inches for each six inches of diameter.*" Thus the mechanic must remember some one certain measurement for a certain given width. To illustrate, we will use a different width from that given in the July issue. An octagon 7 feet in diameter, the length of one of the sides will be 2 feet 10¾ inches. Now to find the length when diameter is 12 inches, the difference between 7 feet and 1 foot is 6 feet; allowing 2½ inches deduction for each 6 inches of the 6 feet, will give 2 feet 6 inches; subtract this from the known measurement given above, and we find 2 feet 10¾ inches less 2 feet 6 inches, leaves 4¾ inches, the correct length of side when octagon is 12 inches in diameter. We simply used 9 feet for width of octagon, as that is the average width for bay windows The following are some of the measurements in practical use:—

Diameter	7	feet	6	inches; side,	3	feet	1¼ inches
"	8	"	0	" "	3	"	3¾ "
"	9	"	0	" "	3	"	8¾ "
"	10	"	0	" "	4	"	1⅝ "
"	10	"	6	" "	4	"	4¾ "
"	12	"	0	" "	4	"	11¼ "

The rule can be applied whether the diameter is 8 inches or 80 feet.

Driers in Paints.—What are they, how used, and how do they act?

The above three questions are asked by a young apprentice. Their brevity pleases us. The drying of linseed oil is due to the readiness with which it absorbs oxygen, and any material which promotes this absorption is termed, in painters' parlance, a "drier." These, by yielding up the oxygen they contain, encourage the oxidation of the oil.

As many pigments retard the drying of the oil, the addition of driers is necessary to prevent the paint from remaining sticky, or "tacky," as it is termed.

The principal driers are acetate, or sugar of lead, sulphate of zinc (white copperas), and litharge (oxide of lead).

Observe the following points in using driers:—

Not to use them unnecessarily with pigments which dry well in oil color.

Not to employ them in excess, which would only retard the drying.

Not to add them to the color till about to be used.

Not to use more than one drier to the same color.

Avoid the use of driers in the finishing coat of light colors, as they are liable to injure the color.

Our correspondent should procure a standard work on painting, and spend his leisure time in study; this office can furnish any work published in any branch of the mechanical, scientific, or professional occupations and trades.

A bricklayer's hod, measuring 1 foot 4 inches by 9 inches by 9 inches, equals 1,296 cubic inches in capacity, and contains 20 bricks.

What is meant by "larrying," a term used by bricklayers? The best way of laying the paving or bricks in the body of the wall, after sufficient facing bricks have been laid, is to lay in between the face bricks a thick bed of "larry," or rather liquid mortar, and then slide each brick along in it into its proper place, in doing which the mortar rises to the top of the joints, the process being called "larrying."

Please state specifically the difference between carpenter's work and joiner's work.

Carpenter's work, as distinct from that of the joiner, consists of framing and putting together all the wood-work connected with the proper construction and stability of a building or other kind of structure. He supplies all the wood-work required to be built in or bedded on brick walls, such as plates, templates, etc.; also all centers, turning pieces for arches, etc.; the carpenter constructs roofs, lays the floors, erects partitions, nails on the rustic outside, and what is usually termed inside finishes.

It is seldom that a carpenter is a first-class joiner. The larger timbers with which the carpenter has to deal, and the comparative absence of that high finish which is essential to joiner's work, render it almost impossible for the same man to be a first-class hand at both branches of the trade. A first-class joiner is always too slow and cramped at carpenter's work, and a first-class carpenter is not usually sufficiently attentive to those details which constitute highly finished joiner's work.

After a house has been built and covered in, the joiner takes in hand all the wood-work, as a rule, connected with paneled partitions, doors, skirtings, dados, etc. In joiner's work, close-fitting joints and smooth surfaces are the chief objects in view, whereas the aim of the carpenter is to give strength to resist the strains to which his work may be exposed.

All surfaces left exposed to view are worked smooth with the plane by the joiner. He must also exercise great care in fitting and framing the various parts together, that they may be affected as little as possible by the shrinking or warping of the material used.

We have stated the difference between a carpenter and joiner as the terms are generally used. In San Francisco, and, in fact, all over the Pacific Coast, the term joiner is seldom used except in connection with cabinet work. The first question a foreman asks of an applicant for work is, "Are you a full hand?" and the answer establishes the questioned mechanic's abilities to perform any certain work. "First hand," "second hand," "floor nailer," "partition setter," "inside finisher," etc., are terms used by men applying for the honor of swinging a hammer or pushing a jackplane, etc., on any certain job. We remember seeing a sign as follows:—

JOHN SMYTHE.
CARPENTER, JOINER, & PIECE WURKER.
Floors naled and Sash put in.

If the man's abilities were equivalent to the knowledge of grammar, as evidenced by the sign, we pity the looks of the work with which he was connected. *Piece workers* are the *scabs* in the carpenter's trade

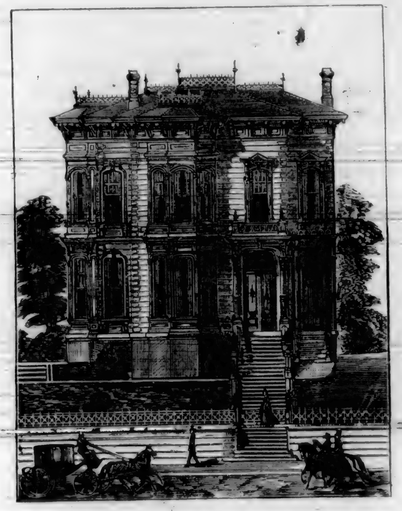
Lead Dots.—In securing lead to wood-work on roofs, etc., and to effectually protect the nails from rust, etc., the following method is used: Wherever a nail comes, hollow the wood out slightly; drop the lead into the hollow; drive the nail in through the center of the hollow, and then fill up level with solder. The same may be done without hollowing out, but then the lead dot covering the head will project above the surface of the lead work.

In giving old lead in exchange for new lead, it is generally customary to allow six pounds per cwt. discount on the weight of the old material, on account of the latter containing dirt, etc.

Fish vs. Scarf Joints.—When the beams abut end to end, and are connected by pieces of wood or iron placed in each side, and firmly bolted to the timbers, the joint is called a fish joint. When in a joint the pieces overlap each other, and are bolted together, the joint is styled a scarf joint.

An average gas burner consumes about four feet of gas per hour. Windows, as ordinarily constructed, will admit about eight cubic feet of air per minute.

At the drum-tap 9,000,000 drilled soldiers would take arms in Europe.



Art and Architecture.

[Special for this Journal. By F. Hillert, Architect and Mechanical Engineer.]

XVII. BOUNDARY OF PERCEPTION.

To enter on the many explanations of beauty which partly contradict each other is impossible, since the best of them can be referred back to the harmony of spirit and form, and the accord of the power of imagination with intellect when divested of the learned shroud. The difficulty of the subject matter lies herein, that we must abstract the spirit of the beautiful from a number of beautiful things; that our feeling, depending on many conditions, will always speak with it; and that objectivity and subjectivity, principally and with lasting truth, cannot be parted and separated from general views and definitions, which, in themselves, would be comprehensible. Human speculation finds here a boundary she cannot pass, but could she succeed in uncovering the secrets of the human heart, and the miraculous blending of spirit and mind, as they are shown by the pleasure in the beautiful, and discover sober and intelligent laws, it may be that the finest ornament of beauty worth living for would be lost irreparable to humanity.

XVIII. IDEAL OF BEAUTY.

By such characteristics of beauty, as well as a pleasurable sensation of man, the quality and nature of things point by the impenetrability of its spirit back to a mystic cause, without which we cannot conceive or think of the consummate perfect beauty. Then as to man indeed the truth of yonder unapproachable image always will remain, but will destroy him as soon as he lifts the veil; but, nevertheless, he anyway incessantly aspires and presses towards the eternal tree of knowledge, hunting and seeking his liberty in vain, through all zones and seas, and at last, beginning with the smallest, wrestling with himself, must gain his liberty; so he also strives mightily towards the beautiful, but the highest fulfillment of the same remains to him always concealed. Man has presentiment, demand, and pursues to the highest aims of truth, liberty, and beauty, but he never reaches them. Name the primeval cause to which those aims point, as we like, put the relation to a supersensible cause, if we want to express ourselves generally comprehensible; and still more, to give to the human being a contentment of mind, we must, then, always say that the highest truth, and the highest good, as also the highest beauty, rest in God. The being of God once settled, out of him flows the wonderful harmony, which in our feeling, in our mind, solves, in fact, the problem of the spirit and conception of beauty.

The highest beauty is in God, has been said with categorical decisiveness of conviction. And in fact if we speak, from things which by our intellect we do not comprehend, the secret precedence in our breast, but anyway are touched in our deepest mind by unexpressible beauty, and almost raised above ourselves, then we find the purest and only fulfillment in the belief in the existence of God. We see then in beautiful things the images of eternal beauty, and in nature the appearance and phenomena in which only one highest spirit, God, is expressed; and in art the secret revelation of the human spirit, in which rushes the aspiration of the divine breath,—truly a noble and exalted vision of nature and of art. And if we look back to our inward mind and place together and compare the manner of sentiment of man himself, we recognize that in yonder trait is divine beauty; and where we find it expressed clear and shining, we stop there admiringly and say, A godlike, a beautiful soul. The pure inner harmony of mind, undisturbed by any blemish, any uneasiness, finding in itself and its God the most perfect satisfaction, and anyway knowing nothing in its own heavenly purity and innocence, but in sacred aversion and awe recoils when compelled to approach divinity by a worldly symbol. The same speaks wonderfully and enchantingly, and in the figure and in the eyes of such men rests, visible glorious, and magnificent, a beauty which could be called superterrestrial if she would not appear visible on earth; but even in death such a soul may be able to effuse over its dying feature the purest luster, the noblest peace. Nobody praises the soul higher than a poet. To him she stands higher than beauty of nature or beauty of art, and well may be added, unknown to himself, the beauty of his own soul, untarnished by meanness and coarseness.

We can easily realize and perceive that with such supersensible and figurative illustrations for our knowledge, nothing is to be gained where our sensitive faculties come direct to play, as with the beautiful.

XIX. SPIRIT AND NATURE OF A WORK OF ART.

When the beautiful, as has been explained, in respect to the thing, is perfect, harmony of idea and appearance, or, as we commonly say, in accord and harmony with sense and form, so is herewith expressed the characteristic of the meaning of a work of art. But how is this harmony between the spirit and form to be understood? In the inward, immediate, and direct manner, and so that the meaning, the idea, of a certain work of art cannot appear in a changed form; not to be represented and made to appear in other stuff, without itself being changed and altered. Hereby is, in the same time, the impossibility expressed, to bring the idea of a work of art to view by words; what direct can be seen at each piece of music, on every object of the forming art from which, by the most correct description, a clear view and conception never can be gained; the same finds, in a closer sense, its unlimited application on poesy. Then, as soon as it is tried to reproduce the meaning of a tragedy, of a poem, in other words, the insufficiency and inability appear. The work of art is inseparable from its own peculiar exclusive form, which necessarily belongs to its spirit and meaning, as the body to the soul of man; but the form is enlivened and spirited by the idea showing and existing in the work of art, as its soul, which is invisible, as the soul of man. Considering, and not to drive the comparison of a work of art to its highest pitch, and arrive at discouraging results for the human mind, that man is a living organization, having a purpose of his own will, when the work of art is a make, having only the semblance of an organic life. But since the work of art does not know a purpose of will, but only wants to fulfill this one, to be beautiful, it can attain the same more perfect, as in general the natural organization, having other purposes to fulfill.

The idea of a work of art only originates in the fantasy of man, *i. e.*, it originates in the power of his imagination, his mind; without that the intellect in a rational way can get to the same—in direct excitation, with which throughout a more or less raised effect of the mind is connected. The idea of his own imagination, man will and must, by his own inner urgence and drift, make visible and conscious to himself, and in doing this he creates at least a basis for his work of art. He does not sober down the charm of his own inner vision, in giving the same in words, and with his intellect seeks an expression accordingly for it; but his inner vision of mind flows direct into the lines, in the color, into the modeling clay. He touches the lyre and draws from it melodious sounds which, in his own imagination, presageful and yet knowingly lived, or he powers them in words. He does not seek the whole richness of his soul. So works of art are produced, noble, high, and beautiful in all, perfect and well equipped.

XX. RETROSPECT.

Connecting all together, we obtain from all our observations which we, in regard to the explanation of beauty, as well as in creating a work of art and its enjoyments, always and unalienably, were referred to incidents of our mind, taking away therefrom all logical perception and arriving in us to a consciousness which distorts, stains, and destroys, so soon as we wish to reconvey them to bases of reason, to establish and prove the same by ideas of reason. But if we now consider that the happiness and the pure contentment is poured out by the world of the beautiful, and when we think that the highest reward for a good and noble act done disinterestedly lays in our soul, and if, lastly, we must acknowledge to ourselves that even the abstract thought gives the highest contentment to man, only then, when in a victorious satisfaction out of a conflict he has gained to the world a truth, can rest a moment,—well might we throw up the question, since such moments to the human being grant a complete satisfaction, and hereby a presentiment of the highest happiness is accorded. Does, then, the inner essence of human life lay more in the pleasurable perception, or, as we might believe, in the thinking?

Before we proceed any farther, we should attach here some remarks on the other kind of the æsthetic effect on our mind. We spoke of the beautiful, but with it the whole dominion of sensible impressions is not exhausted in regard to the form and its signification. But since to our feeling, if otherwise we do feel, nothing is indifferent, it follows we distinguish only that which is agreeable to our senses from that which is disagreeable. The former is positive; the last negative. The last we call ugly, terrible, monstrous, and such like, but here we cannot enter on its explanation.

XXI. THE SUBLIME.

The positive does not exhaust itself alone with the beautiful, it includes in the same time the sublime and the cheerful, and between these two lies the beautiful. The sublime exists only in nature, and only such things are for us sublime which bring us direct by the power and might of their aspects to the presentiment of a divine cause of their creation. Not the magnitude of the spiritual meaning for itself is decisive for the sublime, but this religious relation; not the preponderance of the ideas over the form, but the indirectness with which our mind, by its aspect, is directed to God. But if art wants to effect such like, she becomes symbolic; man can only express that by his work, what he comprehends; that lying and being in the sublime, he does not comprehend; he has only a presentiment, and therefore can never make the sublime. But the perfected work of art, we say, originates by a breath of divine inspiration, and therefore must, in the perfect work of art, lie a touching point of the sublime, even only a touching point.

XXII. THE CHEERFUL, MERRY.

The cheerful (jolly) is not in nature, but only in art. If before the sublime our disposition becomes one of veneration, even of worship and adoration, then we want to enjoy the beautiful, full and whole; but over the merry we want to laugh. But as not all that we venerate is sublime, that we enjoy is beautiful, so is not all over which we laugh, merry.

To explain, the cheerful or merry, or, as it may be called, the comic man, has not been successful. The question, What is comic? has not been solved. We decide, with surprising security, this or that is merry or that is not; but why we do so we cannot support by a general everywhere-satisfactory definition. Since Aristotle, all æsthetics on the definition of the merry, became themselves merry æsthetics. The grades and undergrades of the merry in all possible arts make it more difficult to bring them to a common subordination, to one definition, which we will leave to the reader to bring under one cap, the humoristic, the witty, ironic, the caricature, the burlesque, grotesque. If we limit ourselves to the forming art, we recognize that in all comic works pure harmony is disturbed in a manner, that subject matter belonging together are set up, that is, that contrarieties are united in an unusual manner, and that matters belonging together are connected in an unusual manner. To this opposite only spiritual, only in the idea, then, the work produced is humoristic; but if it appear in form, it becomes a caricature.

XXIII. THE HUMORISTIC, THE CARICATURE, AND THE SATYR.

The humoristic picture, the truly proper form of the appearance of the comic in art, is always without a sting and harmless, and follows the general rules of form.

This meaning is in the spiritual conception, in the manner with which the artist entangles the contrarieties and solves them again. With humor we can only view general evil, folly, and weakness, and humoristic work, therefore, can only in a general sense point its expressions against a certain person; then the conditions of human society furnishes stuff for the forming and introduction of contrarieties. Inasmuch as the plastic in single works can be humoristic, painting is any way the dominion in the forming art, and indeed a part of the mythological objects, the animal, fable, etc.

Caricature is wit drawn, and has always the purpose to ridicule, to scoff, to mock, to humble; is mostly directed against a certain person. She has therefore a point. She is an exaggeration and therein lies her comical result. But since the same already pursues an outward purpose, she does not belong any more to the dominion of the pure art; she uses art as a means for its purpose; may be that the figure is stretched, and that to the same is given an excessive large head; and may be that the same introduced in extraordinary relation to other figures and things. The caricature always remains a certain premeditated disfiguring and deforming of the peculiar form, and therefore in this sense does not belong to the domain of art. An intermediation between her and the humoristic work is the figurative satyr, which, as it were, in a harmless way, secures its victim, and, when secured, and begins to rejoice over the humor, the person of the same unaware, is struck a blow in the face with the satyr's cloven foot. Hereby is a regular form observed, but the spirit is directed against a certain object with the intention of a covered assault. This particular moment taken from speech is in art difficult to represent, but it may be introduced in the same with the assistance of the comic allegoric.

We must desist here from a further expounding of these difficult relations, which would remove us from our purpose, and point only to the fact that as the beautiful in its highest perfection touches the sublime, so its lowest state has already mixed with the ugliness, that is, its own negation; it is in us a gradual succession of æsthetic impressions and feelings; but when the merry passes over us without any deep impression, the sublime captivates us, the beautiful gives us full, pure, and noble satisfaction, which remains with us and is lasting.

The morning gate of beauty is the consecrated land of perfect humanity; behind him lies the merry world, before him the sublime infinity; but only under the ark of peace, which is a protective haven adored with all the gifts of art expanded over the race of mortals, men thrive, whole, good, able, and noble.

XXIV. THE DIFFERENT ARTS, THE THREE DIVISIONS.

We have before already separated the forming from the art of sounding, according to their marks of perception, and both only in the manner as to their expression, designated them as different. We turn ourselves exclusively to the first, which we, in future, will abbreviate, simply calling it art, when the sounding art generally is introduced as poetry and music, which is the plain language therefore in general use. Of the art in the closer sense we have the art of building (architecture), of sculpture, and of painting, the two latter united to the arts of forming. They are founded throughout on the same origin, and their differences are again only in their peculiar condition in which each of them in their manner brings its work to appearance.

XXV. THE ART OF BUILDING (ARCHITECTURE).

The art of building is the least art in all its parts since the inventing or designing artist does not himself execute his own work, but has the same done by others, under his direction. The sole artistical effect lies in the conception of the plans which he makes and fixes, and accordingly the building is executed.

At such designing the artist's fantasy must be in complete and full tension, to bring to him in his mind the building to be designed so clear and visible that he can oversee it as with a single glance, detecting no faults and finding it satisfactory. Then with the plan once decided and determined and the execution started, the same, on the main, must be proceeded with, as changes of any considerable extent and importance are not admissible; when the other artists, and fully the poet and the musician, have unlimited sway. But not only this, but more the mechanical fitting together of the building material, the construction based on the statistical laws; but, before all, the problem that the building itself must satisfy its practical purpose, gives to the art of building an unartistic addition, and yet are all these moments absolutely necessary to give to the building a beautiful appearance. Then were the same put up without connecting and joining of material, without construction, hewn and worked out as a whole of the natural rock, as perhaps the free-standing buildings and cavern temples of the Indias, it will always bear the character of the crude and accidental; but when a building has no practical purpose whatever, or at least not a reasonable one, as, for instance, some monuments erected in our time, it brings forth the impression of the gloomy, uncomfortable, and senseless. From this we learn that the purpose is the essence of the artistical idea; that a building without it misses its vital part, as a work of art is in want of the spiritual sense and meaning. It is, then, no more a work of art, but a nonsensical play work: just as a purposeless heaping up and adorning of heavy and huge masses of stone would be a senseless play. Herefrom it would also appear that the art of building with its practical purposes could not produce a work of art, which would for itself be beautiful, and in fact and in the face of the higher demands of art ceases to be art. But the artistical lies in the conception of the purpose in its perfected sense, and in the effort to show this in the building as a direct expression. This is the principal thing;

but a second moment we have in this, that the crude masses of the material used in the construction, must obtain a beautiful form, in which the legitimacy and law of the former finds its expression so that the building, as an organic growth, destined for a clear, unmistakable purpose, is expressed by its form. The beauty in the art of building has a good deal of similarity with the beauty in nature (see No. 15), from which the same obtains his artistical form not in a direct manner but so that she unites the same with geometrical symmetry, and so finds a natural expression for the mathematical dryness of the construction. Herein exists the æsthetical language in the art of building, the ornament, which is the more powerful, perfect, and beautiful, the more in an indirect manner, the construction of the statistical motives and destination of the building members adorned by it, is shown. So before all the Greek Doric column, a strongs powerful, slightly swelling or tapering shaft growing out of the bottom (foundation) of the building in a thickly set stem, giving to the heavy burden resting on it a sure and safe support and by its ribs and caneluers fluting, giving to it the appearance as something organic, grown in the manner of a cane, tapering gradually with the ascend where one or more rings impart to it a larger and stronger coherence. The plant grown in Greece (*Dolden specia*) was a hollow tube and ribbed outside, having a larger compressive resistance and likely was taken as the symbol for the adoration of the shaft of the column.

Above the same swells, in beautiful curved lines, the capital on which an ornament of turned-down leaves indicates that the weight of the entablature is acting upon it. Around the square plinth, serving as a mediator and receiver of the weight of the beam resting on the column, runs a beautifully arranged ribbon artistically wrought around. This may serve to indicate how the art of building ornaments and decorates, whereby it cannot be passed in silence that very many ornaments, namely, with barbaric people of the middle ages, and even later, and now, partly in their rawness and partly by their playing tendence, are far off from the earnest and the truth of that which it should be to give to the form of the construction a spiritual meaning. To the fantasy is here left a wide range, and it can on the different parts of a building on the massive inclosure, the running around, the free standing, the loaded and the load, the free overhanging, etc., sufficiently manifold, manifest itself, of which the more or less perfect ornaments of all the different styles of building give evidence.

Have the single parts of a building in accordance with their spirits obtained their beautiful form, then they have again to be referred by their position and situation to each other and to the whole purpose of the building, the spiritual meaning of the same as a whole, what namely holds good and is true in regard to the preventing of the mixing of the different styles of architecture. This purpose finds its first expression in the first sketch, on which is based every matter in the ground plan, which arranges the situation and position of the single rooms to each other according to their contemplated use, but already indicates what construction the artist in the execution of his building will use. Is a wide, large hall, perhaps for the sitting of a legislature, to be made, then are no Doric columns nor Gothic arches or such like to be applied, but inclosing walls are to be erected, over which a wide ceiling, free and easy, is to be suspended. This is, in the same time, foreseen and decided in the plan, and since, as has been shown, the ornament,—the art language of architecture,—are not to be selected arbitrarily, but must be founded on the construction, then the plan points already to those, and the same to the construction. The unity of idea is therefore unconditionally existing, notwithstanding all apparent contrarieties, and as the building artist conceives his problem, and then shapes and forms it, he must complete all in one in his fantasy; plan, which arranges the building member to each other, construction, style, ornamentation. One is conditioned by the other, not one before the other, and all besides each other. By means of a comprehensive drawing he supports the picture of his imagination; and his sense of taste must be his guide for the production of a real, true work of art.

It is generally known that the Washington Monument is higher than any other structure now in existence. While this fact is seldom disputed, still it does not equal the Biblical Tower of Babel, which, according to the best authority, before its fall had reached an altitude of about 680 feet, being 125 feet higher than the monument erected to the memory of Washington.

A Frenchman has found means to restore the life-like expression to the eyes of dead persons. He places a few drops of glycerine and water in the corners of the eyes and the effect is said to be startling, so life-like do the eyes become.

Building Outlook in San Francisco.

Although the remark is repeated by a thousand tongues daily, that "building is being overdone in this city," still a hundred, more or less, of owners of building lots demonstrate each month, by commencing building improvements, that the streams of faith in the future of San Francisco continue to flow.

There is a considerable showing of vacant houses in the city, but not sufficient to deter others from improving their real estate. The greater number of erections are for rental purposes, but there are also a large number of private residences under way and contemplated. The improvements are not confined to any special locality or portion of the city. Some parts are more desired than others, but all alike share in the general prosperity.

As to the quality of construction prevailing, it averages fair, but only a small proportion aproximating first-class. The universal disposition of owners is to economize, and build as "cheaply as possible." There are but few cases of even reasonable liberality in outlay. The dollars of cost are weighed for all they are worth, and made to spread out to the last grain of value, without fair and equitable compromise in the class of material and workmanship. The best of everything is wanted, and any suggestion proposed by architects to lessen outlay, by introducing low-cost articles of not unquestionable quality, is almost sure to be rejected, with a lingering desire on the part of the owner, to enjoy the benefits of the more expensive without increasing the total cost.

These remarks apply more particularly to houses built to rent, in the erection of which wise and prudent economy is proper, as rentals are generally regulated by the sum of costs of construction, and renters are not willing, as a rule, to pay five or ten dollars per month more for a house containing no more than equal accommodations, simply because the owner may have exercised a fair degree of liberality in introducing better materials or fixtures, which do not produce some visible effect to the eye, and an impression upon the mind of the renter that the demand for the extra amount is warranted in certain ways and is reasonable.

It is poor economy, however, if not absolute folly on the part of any owner who attempts to cut down outlay, by resorting to the use of "shoddy" construction in any part. For, while it may prove a present saving, it is an expensive one by reason of the continual repairs afterward required to "keep things in order;" for it will be found, as a rule, that poorly constructed buildings require almost constant attention to keep them in repair and good condition. "Shoddies" of any sort are poor investments, particularly in permanent building constructions, where decades, if not generations, of wear and service are required. This, intelligent owners readily realize, and, therefore, dictate approximately first-class material and workmanship, as practically the more sensible and economical course. But it is not always the case, indeed, but seldom, that this intelligent understanding of matters is followed to its legitimate application,—a willingness to pay the excess in value and cost of the good over the inferior. Consequently, the absence of fair liberality toward those engaged in building works, by those for whose profit and benefit they are executed, has a bad effect, in that it stimulates purposes on the part of contractors to meet this condition of things, by practicing methods and procedures calculated to equalize the exactions of those who want excellently well-built houses, at five to twenty per cent less than a right and proper cost. It is simply absurd to suppose that men will not work out every possible saving in executing contracts, in which a fairly liberal disposition is not manifest by owners, in confining competitions to recognized, trustworthy, and competent bidders, and excluding the rough scruff and irresponsible class from the privilege.

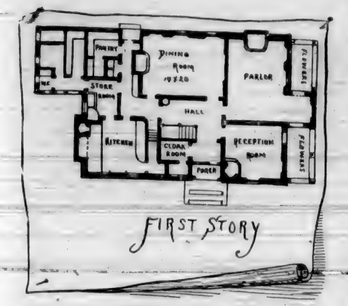
Tract distributers in New York complain that thousands of tracts are being distributed throughout the tenement house districts and along shore, printed in imitation of the genuine, and bearing titles such as: "Be Saved," "Salvation for All," and the like, which, after a page or two of religious argument, run off into eloquent patent medicine advertisements.

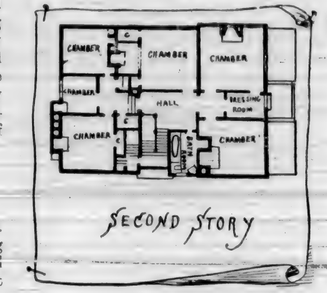
Smallest convenient size of slab for a fourteen-inch-wash bowl, 21x24 inches. Height of slab from floor, two feet six inches.

A double bed is six feet six inches long, by four feet six inches wide. A single bed is two feet eight inches wide, by same length as above.

A 4x8-foot billiard table requires a room not less than 13x17 feet.

Plans for a Commodious Country House.





The accompanying engravings will well bear a study from those contemplating the erection of a commodious country building, where compactness ist he principal feature to be taken into consideration. The rooms are ample in size, and a close study will disclose that every convenience is provided for usually found in this class of houses.

About Sleeping.

We believe in sleep and enough of it. A man may get rich faster by long working hours, but certainly he will live the longer by devoting at least eight hours of the twenty-four to reposeful conditions of mind and body. Franklin declared that six hours sleep were enough for any man but a fool. Franklin was undoubtedly a great philosopher, but in this respect he probably erred in making his own frugality the standard for the rest of mankind.

Still one may sleep too much. A recent writer grows enthusiastic over what he calls the forgotten act of lying abed. It is certainly a clever bit of consolation for those who must do it.

"One of the most useful yet neglected of all the arts is that of lying abed. The damage that is done by persons getting up is past all reckoning. All the mischief and crime, the counterfeiting and forgery, the murder and theft, are perpetrated by parties who persist in getting up. Not only individuals do wrongly by leaving their bed, but rivers as well do an immense amount of damage. "What man ever broke his leg on a slippery pavement or was run over by an omnibus, who lay in bed?

What great achievements have been accomplished in war, in poetry, in literature, by genius abed! 'Coming events cast their shadow before'—one of the most memorable lines in the English language—originated with the poet, Tom Campbell, one morning before he had risen. Longfellow thought out that exquisite poem, "The Wreck of the Hesperus," after he had retired. Ben. Franklin said, 'Early to bed and early to rise makes a man healthy, wealthy, and wise.' Now Franklin started out all right but got terribly mixed up when he said 'early to rise.' There is the fatal mistake. People who rise early are sure to catch the malaria; the ground is full of half-hatched poisonous germs; the sun is not up and has not warmed them into life, giving them wings and set them adrift. Poor mistaken man, he arises, inhales them all; they fructify and poison his entire system; hence chills, fever, malaria, and half the ills that human flesh is heir to.

"'Rise before the sun,
And make a breakfast of the morning dew,
Served up by nature on some grassy hill;
You'll find it nectar.'

"Was ever more arrant nonsense written? Fancy a man getting up on a cold, rainy morning and climbing high hills on an empty stomach, but to eat—what? Why, dew. How long would that fellow last? Wouldn't he be a fit candidate for Lone Mountain, and no questions asked? But the early bird catches the worm. Yes, but the sharp boy knocked that delusion in the head forever and eternally when he said: 'Father, there's the point—what in thunder did the worm get up so early for! He trifled with destiny; he tempted fate; he should not have done it.' That boy was a benefactor to the human race. He was sound on the lie-abed question.

"That French proverb says: '*De lit a la table, de la table au lit*'—'From bed to grub, from grub to bed.' That's something like it. Get up and eat, eat and go to bed again. Why not? All the animals do it. All nature, the grandmother of us all, teaches it. Every animal in the world eats and seeks repose. The cow eats, and, lying down, placidly chews her cud; the anaconda swallows an ox, horns and all, and goes to sleep—'sleep that knits up the raveled sleeve of care, the birth of each day's life, sore labor's bath, balm of hurt minds, great nature's second course, chief nourisher in life's feast.' And yet this is what they would deprive us of who say, Get up, and who oppose the art of lying abed.

"Mrs. Macbeth strikes the key-note when she shouts: 'To bed! to bed!' A Spanish minister, suddenly raised to power, signalized the event by going to bed and staying there for fear he might have something to do. It was in bed in the little inn of Waterloo, that the Duke of Wellington received the list of the terrible casualties of the fatal June 18. Gray's 'Ode to Music' was written in bed, and Sam Johnson's 'Lobo's Voyage to Abyssinia' was dictated to the printers before the great author of the 'Lives of the Poets' and lexicographer had arisen. Peter Pindar (Dr. Wolcott) was so fond of lying abed that he received his visitors lying beneath spreads and counterpanes. Rossini wrote one of his finest operas in bed, and was too lazy to pick up a sheet that had fallen away. George IV. lay in bed to read the newspapers, and Macaulay read twenty pages of Schiller before getting up. John Foster thought out his sermons in bed, and the methodical Anthony Trollope used to read an hour before getting up."

The extensive outdoor use of zinc by builders at the present time has directed attention to the peculiar process of oxidation which this metal undergoes, and which is so important to be considered in all applications involving exposure. The rusted surface does not rub off or blow away, but forms a sort of hard crust or enamel upon the surface of the metal, and when laid upon boarding which is or may become damp, or exposed to steam or condensation below, it rusts on both sides. The thin zincs first introduced in this way were rusted through, brittleness ensuing and failure being the result. But if the zinc be of sufficient thickness, after a certain time oxidation ceases, and the result is a body of solid, sound metal, encased above and below by a solid coating, thoroughly impermeable to the accidents of weather or temperature, and which requires no painting. The various ways of spreading zinc consist, mainly, in laying it in a corrugated form without boarding, the trusses of iron or wood of the roof carrying the weight, or in rafters about one foot more or less apart, with a corrugation at each rafter only, or upon a general surface of boarding, in the manner of a lead flat.

It ought to be the aim of every husband and wife to build for themselves some kind of a home, though it be ever so humble, and then to beautify and make it attractive by every device of taste and love. It is possible for very poor people to become real estate owners; the obstacles in the way are not insurmountable; only let each home be built according to its owner's means, not those of their neighbors. How precious is the vine planted by the hands of the children! the shrubs and flowers tended by a mother's loving care! A more intimate knowledge of these pleasures is purifying, ennobling, and strengthening to all natures. The man who loves flowers, trees, and all beautiful things cannot be a bad man; the children who are taught to love these things from infancy, who work, and care for, and help make beautiful their home, are more helpful and unselfish, less frivolous, and more likely to make good and noble men and women. We believe if there was more home-building there would be a smaller number of unhappy marriages, less recourse to courts of law, and fewer divorces.

Some Facts about Bells.

THE nature of the country has much to do with the sound of bells. In a hilly locality a bell will not be heard half so far as if the land were level or nearly so. A bell will be heard a great deal further lengthwise of a valley than over the hills at the sides. Where bell-rooms are lower than the surrounding buildings and trees, these obstructions break the sound and prevent its free passage to a distance. Towers having small windows or openings, with the lower boards close together, often box up the sound. In cities, the noise of steam and horse-cars, manufacturing establishments, carriages and carts rattling over the pavements, etc., is so great that bells are not expected to be heard at any considerable distance, and this is the reason why, in all cities, several bells are used for fire alarm purposes, it being impossible for one bell, no matter how large it may be, to be heard above the thousand and one noises incident to every large place. It is said that the largest bell ever made in this country weighed 22,000 pounds, and before it was fractured hung on the City Hall, in New York. On one or two occasions this bell was heard up the Hudson River thirteen miles, in the night, when the city was comparatively quiet. It is a great mistake to suppose that bells can be heard in proportion to their weight; that is, a bell of 2,000 pounds will be heard twice as far as one of 1,000 pounds. This is not so, for the reason that the larger bell does not possess anything like twice the resonant surface of the smaller one. What is gained and admired in the larger bell is its deep, majestic, and dignified tone, which it is impossible to secure in the smaller one, the weight of the bell invariably governing its tone. A bell of 100 or 200 pounds, in an open belfry, on an engine house, a school-house, or a factory in the country, is frequently heard at a long distance, out of proportion, apparently, to one of 1,000 pounds in a church tower near by; and instances of this kind frequently cause no little comment in the way of comparison. One reason for this is that the small bell has a sharp, shrill, penetrating sound, that must, of necessity, be heard a great deal farther, in proportion to its weight, than the low, mellow, "church-going" sound of the church bell. The same principle applies to the whistle of a locomotive, and it is heard a long distance, simply because its tone is shrill and penetrating. When hung stationary, and struck or tolled, bells will not be heard, as a rule, half as far as when swung. The swinging motion throws up the mouth of the bell, and not only carries the sound off, but imparts to it a richness that is always absent when the bell is at rest and struck. A great deal is to be gained by ringing a bell properly, throwing the mouth well up, and not lazily jingling it. It is not physical strength that is required in ringing a bell so much as "getting the knack" of catching the rope just right, particularly on the second "down pull." The windows in the tower should be as wide open as possible, and the tower ceiled just above the windows.

A LOAD of mortar measures a cubic yard, to make which requires a cubic yard of sand, and nine bushels of lime. Thirty hods filled with mortar will make a load.

THE largest match factory in the United States is situated in Akron, O., which turns out 57,000,000 matches in one day when run to its full capacity.

Building Intelligences.

Where owners' names are left blank, it is so done in most instances by special request.

HILL'S PATENT INSIDE SLIDING WINDOW BLINDS

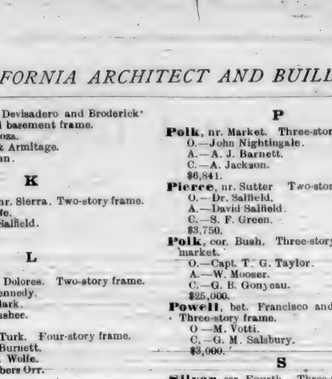
Are Adapted to Any Style of Window

And Suitable for all Buildings, Dwellings, Stores, Office Buildings, and for Houses Built to Rent, Hotels, Boarding or Lodging-Houses are Unexcelled.

THEY are entirely inside of the window casing, and while requiring no furring out or boxing, make it an impossibility to tear curtains, interfere with plants or window ornaments, or become broken by contact with chairs or other movable articles.

The light can be admitted and sunlight excluded from any part of the window; can be instantly removed and taken to any part of the house to clean, and as easily replaced.

They can be opened or closed with the window raised, and without removing articles from the window-sill, and cannot blow open or rattle. The Blind is very light (one-half inch in thickness) and strong, possessing more durable qualities than a hinged blind one inch in thickness.



There is NO SAGGING, BANGING, OR GETTING OUT OF ORDER!

They are made in three sections in height (each section sliding past the others), and any number of divisions in width corresponding to the folds in the old-fashioned folding blinds. They require NO HINGES—all trimmings furnished with blinds—are MADE OF ALL WOODS, finished or unfinished, and COST LESS than old-style folding blinds. They have been extensively used by the best architects and builders throughout the East and West, and have given perfect and entire satisfaction wherever introduced.

ENGLISH AND AMERICAN VENETIAN BLINDS IMPROVED.

The only perfect Venetian Blind in the market. The Blinds can be seen at the Mechanics' Fair. Or for samples, prices, and further information, address

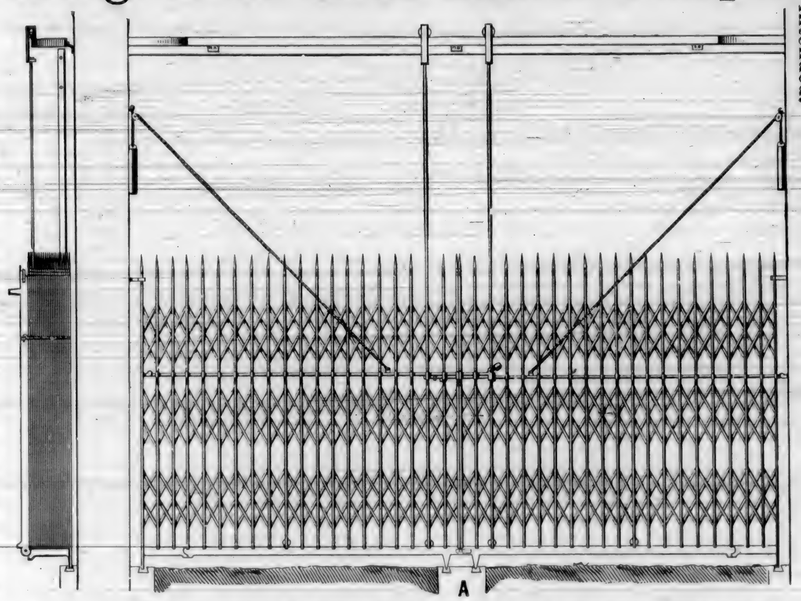
EDWARD B. HINDES, Office 330 Pine St., Room 55, S. F., Cal., or W. S. HOLLAND, Pasadena, Cal., } **Manufacturers.**

The following are a few of the owners who have adopted the HILL BLIND in preference to any other:—

S. W. Fabry, cor. Hayes and Laguna; architect, Miller & Armitage. John MacKenzie, cor. Grove and Broderick; architect, H. D. Mitchel. H. F. Bruns, cor. Geary and Taylor; architect, John M. Curtis. R. B. Gray, cor. Pacific and Van Ness; architect, John Marquis. Albert Meyer, Twentieth nr. Valencia; architect, J. T. Kidd. J. C. Weir, Post nr. Scott; architect, J. C. Weir. Dr. J. Rosenstirn, cor. Sutter and Hyde; architect, Pissis & Moore. A. M. Starr, Washington nr. Fillmore; architect, S. & J. C. Newsom. J. H. McKay, cor. Washington and Steiner; architect, J. H. McKay. U. S. Government, Presidio Reservation; architect, J. H. Humphreys. Baron Von Schroder, 553 Harrison; architect, T. J. Welsh. G. G. Burnett, Larkin nr. Turk; architect, James E. Wolfe. A. F. Le Jeal, Clay bet. Franklin and Gough; architect, H. C. Macy. J. C. Weir, Post nr. Scott (second order); architect, J. C. Weir. P. Dupuy, Taylor nr. Turk; architect, W. H. Bayless. J. S. Morgan, Mission bet. Twenty-fifth and Twenty-sixth; architect, C. V. Pierce. John Ritchie, Woodland; architect, W. H. Carson. Court House, Petaluma; architects, S. & J. C. Newsom. L. H. Sweeney, San Rafael; architects, Pissis & Moore, Court House, Santa Rosa; architects, S. & J. C. Newsom. Raymond Hotel, Pasadena; architect, J. H. Littlefield.

Folding Gate and Guard Company.

These Gates and Guards are manufactured to order in San Francisco, to fit and fill openings as desired. Descriptive Catalogues and Price List furnished.



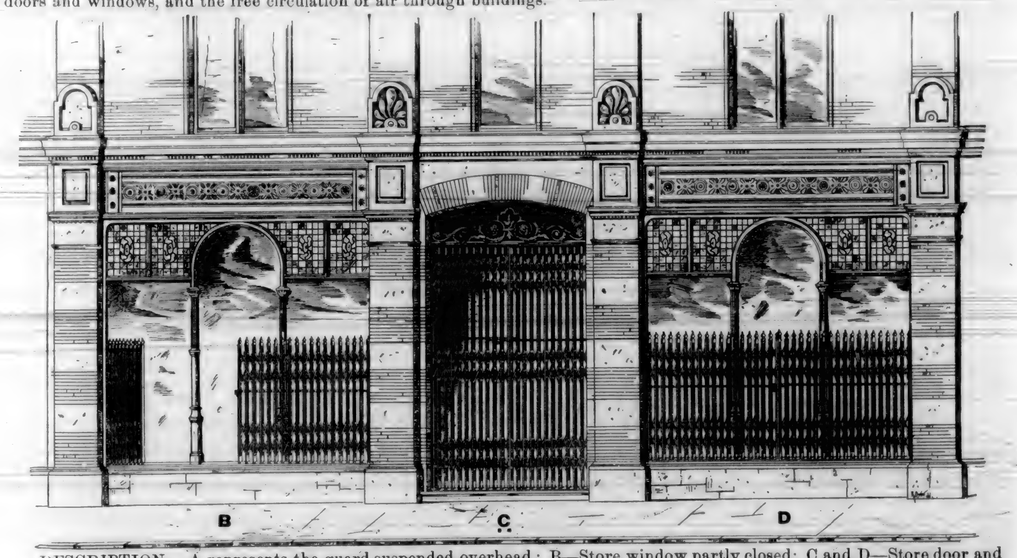
ABSOLUTE SATISFACTION GUARANTEED.—They are easily handled and adjusted, and are the most perfect device in use for the purposes for which they are intended.

Protect Your Homes and Business Houses

WITH * THE * IRON * FOLDING * GATES * AND * GUARDS.

They are ornamental in design, and afford perfect security when applied to store doors and windows—to vestibules, doors and windows of dwellings, and at stables, elevator wells, etc.

When in position they are an absolute safeguard against **Burglars, Thieves, Tramps and Designing Persons,** and can be removed and replaced without unhinging. As a **Sanitary Device** they are superb, permitting the opening of doors and windows, and the free circulation of air through buildings.



DESCRIPTION.—A represents the guard suspended overhead; B—Store window partly closed; C and D—Store door and window fully closed.

GEO. H. RICE, President. **E. J. ROBINSON, Agent,** 109 California Street, San Francisco, Cal. **J. P. LECOUNT,** Secretary.

THE OFFERED SALE OF THIS JOURNAL.

SINCE the first announcement in its pages that the entire interests of this journal would be disposed of to competent parties, a great many personal inquiries have been made, and propositions submitted and declined.

A sale contingent upon certain stipulations might have been made a month ago, but as we propose an unconditional surrender of the situation, we shall hold the fort until a competent commander-in-chief shall arrive, with satisfactory financial credentials.

Negotiations now pending with parties and firms east of the Rocky Mountains, may result in a full change of management by the first of January next, if not sooner. In the meantime the journal will be continued as heretofore to the best of our over-burdened abilities.

A GENERAL EXPLANATION.

Those who have made inquiry by letter, and personally, have asked for all the facts of the case, and what will be included in the sale.

As a general answer, we state: A sale will include every interest of the publication—its good-will, subscription list and advertising patronage, office appointments, desk, bound volumes and back numbers since 1879, outstanding accounts due from all sources, five hundred copies, more or less, architectural, mechanical, and other publications (optional), and all else pertaining to the publication and circulation of the journal.

We state, in answer to the question repeatedly asked by correspondents, in reference to

COMPOSING ROOM AND PRESSES,

That there are none. The journal has been conducted incidentally in connection with our architectural pursuits, and printed and bound ready for distribution by contract.

But with these limited facilities and restricted advantages, and personal attention divided between two great interests—editor and manager, and practicing architect—each demanding our whole time and energies, we have continued our publication work for eight years (less three months) with a profit to ourselves, making a most enviable reputation for the journal, as evidenced by the hundreds of complimentary notices from time to time published by technical, class, and other journals, and preparing the way for some one to continue its publication with great success and profit.

San Francisco Chapter American Institute of Architects.

THE regular meeting of the Chapter was held on September 3, in the rooms of the San Francisco Art Association.

The proposition of H. T. Bestor to become a member as Fellow, was favorably acted upon, and he was duly elected.

Proposition was received from A. M. Squire to become a student member. Messrs. Pissis, Curtis, and Sanders were appointed as an Investigating Committee.

The following communication was received from the Builders' Association of California:—

To S. F. Chapter, A. I. A.: The Builders' Association of California, recognizing the fact that there is in use in San Francisco nearly as many different forms of contracts as there are architects in the city, and believing it to be desirable to adopt one form for use that shall meet the requirements of the building trades, that shall be alike equitable and just to both the owner and contractor, have appointed the undersigned a committee on the part of said association, with instructions to communicate with you and ask the appointment of a like committee on your part, to meet, consider, and present a form to our respective associations for adoption and general use. We would, therefore, respectfully request your association to appoint such a committee at its next meeting, to meet with us at such time and place as you may select, for the purpose aforesaid.

Hoping the above will meet with your favorable consideration, we remain, gentlemen,

Your obedient servants,
Jos. Wilcox,
Jere O. Mahoney,
Chas. C. Terrill.

The Chapter, in accordance with above, appointed Messrs. Wolfe, Kirk, and Gash as the committee.

Election of officers being in order, the following gentlemen, having received the highest number of votes, were duly installed in their offices for the ensuing term: President, A. Pissis; Vice-President, T. A. Eisen; Secretary, B. E. Henriksen; Treasurer, J. M. Curtis; Trustees, G. H. Sanders, A. Laver, J. E. Wolfe, J. Gash, W. P. Moore.

Resolution carried that delinquent members be notified to pay up; failing to do so, suspension will follow.

Summary of Building Activities.

Below will be found the third quarterly report for 1886, as compared with 1885:—

360 engagements for 3d quarter, 1885	cost,	$1,638,260
277 " " " 1886	"	1,490,279
83 decrease		$147,981

As may be seen, the difference of 83 engagements and cost of $147,981 must be recorded in favor of 1885. The corresponding monthly report for the month of September is:—

169 engagements for 1885	cost,	$785,700
106 " " 1886	"	448,177
63 " in favor of 1885		$337,523

We Want YOU, Who Have Not, TO PAY UP.

ANTICIPATING retirement from the management of this journal, those who have *not paid up* their subscription dues will confer a favor by *doing so at once*. Let there be no delay in this matter. We propose to clean up as neatly and nicely as the good pleasure of *honestly disposed* patrons may make possible, and as thoroughly—☞*as the law provides*☜—with those who refuse or neglect to settle their accounts.

Every unpaid dollar due us has been faithfully earned by unceasing desires and earnest efforts to found and perpetuate a California class journal in the interests represented in these columns, and measured by the mental and physical cares and labors, and the financial requirements to this end, every dollar yet due us has been honestly earned and should be paid promptly.

We hope not to be required in any case to invoke legal redress, but as protection of publication interests, which have been and are so often abused by that portion of the reading public who seek to obtain their reading matter without cost, the law in such cases made and provided is, that every man who *receives* a subscription journal of any sort, can be held and made to pay the full amount of subscription, up to the time of *payment* and stoppage.

Questions and Answers.

BUSINESS MANAGER OF ARCHITECT: Will you please to let me into one of the secrets of the "perfumers' art," and tell me how it is possible to make so much "triple extract of heliotrope," when I know from my extended travels, there is very little indeed of heliotrope flowers cultivated for the perfumer to use?

CURIOSITY.

San Jose.

ANSWER.—I do not know that it is just right to expose the secrets of the perfumer or any other art or profession. But as "Curiosity" is an old friend, I will just this once let her know how to make essence of heliotrope without the flowers. Add to a tincture of vanilla a small proportion of oil of bitter almonds; add essence of rose, and orange flower, *q. s.*, and you will have an excellent extract of heliotrope. G. H. W.

EDITOR CALIFORNIA ARCHITECT: I have taken the *Carpenter and Builder* (published in New York), for the past three years. There has been quite a controversy in it in regard to the number of shingles a man can put on a roof in a day. How many do *you* think a man ought to lay in a day, provided he made a good job? H. T.

San Francisco.

ANSWER.—A man working for us, that put on three thousand a day, each shingle to be well nailed, would be doing a very *faithful* day's work. Of course, we know five, and as high as six thousand, have been put on by one man; but we are not answering to "*slapping*" them on, but simply a good day's work well done.

BUSINESS MANAGER OF ARCHITECT: I have a roof, the span or width of which is forty eight feet, and the height eighteen feet. It is rectangular, hipped at each end. I can figure out the length of my common rafters easily enough, viz., thirty feet. What will be the length of my hip-rafters? Also, how do you get the length of the latter?

ANSWER.—If your rafters are 30 feet in length (I notice that does not allow of any projection), by the same rule your hip-rafters will be 38.41 feet. You have simply worked out the problem of finding the hypothenuse, two sides being given. Apply same principle to the hip-rafter—regarding a common rafter as one of the sides, and half the width of the roof the other side, of your triangle.

EDITOR ARCHITECT: As I want to furnish all materials for my building, I take the liberty of asking you how much of lime, sand, and hair will it require to make enough good mortar to plaster 100 square yards?

ANSWER.—Eight bushels good lime, sixteen bushels clean sand, one bushel of hair. The longer the latter the better.

A HOUSE in danger, a family in peril.

THE builder that deceives the architect wrongs the client as well, and if he connives at bad workmanship he demoralizes the workman and constitutes himself a criminal.

GARDEN mold may be good for vegetables, but as a component of mortar it spells early ruin.

GOOD workmanship needs no coat of paint to enhance the execution, for like sculptor's work, good workmanship is best judged in the nude without drapery or color.

WET your bricks, wash your sand, slake your lime, but perish not your mortar with water, or your work will not be worth its bond.

The Shingling Question.

IT is rather amusing to see one whose experience is more than local, to read the questions and answers appearing in various journals in reference to what constitutes a good day's work at shingling. Many unwise and intelligent discussions arise from the diversity of answers given and opinions expressed; while the fact is, that no general answer can be framed which will apply to all sections of country—for the reason that shingles, like nearly all else used in the erection of buildings, possess special characteristics within certain naturally prescribed limits. The man who might perchance "lay" 2,500, or even 3,000, of California's soft redwood shingles within ten hours, would find himself loser upon a bet to lay 1,500 Eastern cypress shingles—or in some cases 1,000—fully half an inch thick, within the same number of hours. There is, also, a material difference whether six-penny or four-penny nails are used, and whether there is to be *one* or *two* nails driven in each and every shingle, or on an average, two nails to each *three* shingles. Again, it makes quite a difference whether the shingles are made of soft redwood, the only shingle now used in San Francisco, or sugar-pine, or white fir, qualities more common in other parts of the Pacific Coast. Either of these kinds, compared with those made of harder wood in other States, and much thicker, requiring six-penny nails, bear no comparison. And the man who glories, as some do, over the feat of laying 2,500 or 3,000 redwood shingles, performs no better nor more noteworthy day's work than do other men who enjoy a sense of pride at having laid 1,000 of a heavier and more difficult kind to lay.

Material Facts for Owners' Consideration.

GOOD buildings are sometimes erected without the professional services of an architect, but whether as good and complete as they would have been under the planning and superintendence of a competent architect, is a question. The proposition suggested is reasonable. For the incessant and perpetual study of an architect is to discover and develop new ideas, to determine and mature better plans, to overcome difficulties encountered in prior experiences, to provide against defects and errors which may have occurred, and, in a word, concentrate the entire energies of his mind and brain, to producing improved results; and it is not reasonable to suppose that among men of equal intelligence, education, judgment, industry, and advantages, that those who devote their time, and employ their mental and physical energies in special pursuits, can properly understand and practice their selected avocation, and by incidental application, also understand as proficiently, those specialties which others, their equals in all intellectual and physical senses, have made matters of constant study and daily application. Men generally master not more than one thing or calling, and as the "old saw" goes, "They that are jacks at all trades, master none." We admit that there are a host of contractors who would have become most excellent architects had they so applied themselves. But a reasonably perfected knowledge of architecture can only be obtained by the possession of the natural qualifications of mind and judgment, and constant practice and study. Incidental scholastic and superficial knowledge does not, by any means, qualify men to assume the practice of a profession, than which no other requires the more intense exercise of every mental and intellectual faculty. Hence, we find men calling themselves architects who are simply pretenders, mere frauds, aspiring to be what they can never become, through fatal defects in their natural or acquired qualifications. But mistakes sometimes occur even with the best and most careful architects, and generally when no architect is employed, and almost always when buildings are intrusted to the manipulations and control of parties whose presumption is only equaled by their fearful lack of judgment, and complete ignorance of every correct principle of architecture.

Facade of Suburban Dwelling.

VARIETY in architectural arrangements is as much to be desired as variety in dress. The accompanying illustration presents the front view of a dwelling lately erected in a suburban portion of a country town. The original plan contemplates two houses with exactly the same façade, only having the main entrance doors on opposite ends of the front. By this arrangement of two owners combining the main features of a design, and building conjointly, a much richer and grander effect is produced. From a short distance away, the house would present the appearance of a magnificent villa. As shown, wood, brick, or stone may be used in the construction. Shingles on the gables would much heighten the effect. Due regard must be exercised in regard to the colors used in painting the exterior.

Art and Architecture.

[Special for this Journal. By F. HILLERT, Architect and Mechanical Engineer.]

XXVI. SCULPTURE.

THE art of building incloses space and makes rooms, to which, by the form signifying the purpose, and its creation the semblance of organic life is given, raising the same to a work of art.

With sculpture, every practical purpose for the use of its work drops away; its way of beginning and the staff are of themselves indifferent; they are only wanted to be seen. From the art of building to sculpture, is a large step for independent development, to pure liberty of art from all outside efforts consummated. What conditions are imposed upon sculpture, above all the visible, bodily appearance of the work? The same have, with the work of architecture in common, the extension in length and breadth, but as works of art they are inaccessible to their inside, even as a colossus, the Statue of Liberty of New York, etc., and only its outside in her artificial form, immaterial of the same, is hollow or of a solid mass. The ideas which man can speak out and embody in such work of art, must be shown and given in bodily individuality. The sculptor is to individualize, that is, to make figures. From the—from nature borrowed, mathematically sheamated—ornament by which the art of building indicates, sculpture makes a large stride, by taking the organic living for its model and pattern. Men and animals, single or in groups combined, are her objects, but she has to represent the same so that, out of the form, the figure speaks directly the spiritual, also the character, an action or a general idea. In the structure of the body, the position, the tension of the muscles, the motion, the form of the head and the features of the face, must by this the spirit be spoken out; what in reference to a certain action, an olympic and sword combat, or a certain character, such as of a sudden anger, must lie near by and be self-evident. In reference to the representation of a personified idea it is more difficult to find the right, and we must admire the high sense for beauty of the ancients, which gave to them the idea of love, the most graceful figure; to the idea of pain, the noblest expression; to that of strength, the most perfect form. In the gods and heroes of the ancients are general ideas personified, and this is the highest problem of the plastic. The Christian plastic, compared with the antic, is, ideally taken, poor, since, with the exception of the crucified, of Maria and the disciples, by the legions of saints, is hardly a figure, in which really something general, human, and dignified is spoken out; and only lately we arrived to represent faithful, devout submission, the joyful death of a sacrifice and similarities, even if more so shown in painting.

The works of sculpture are made from one kind of stuff, worked from outside toward the inside, as with stone, marble; or from the inside toward the outside, by putting on, as with modeling clay; or they are cast in a certain form with bronze, iron, and cast-stone, etc. Since, first, what was probably done in past ages for marble and cast-work models of clay were made, then is, in regard to a true work of art, the making of the model in clay is decisive. The later executions are secondary, and belong to the technic, whereby we must not lose sight that the artist already at the making of the model must know how, later, he will complete his work, since the manner of his execution here and there in single parts at the commencement will require a different treatment.

By all works of sculpture is only one kind of stuff, therefore only one color in existence, sculpture colored, as, perhaps, the gilded ivory pictures of the ancients, inlaid bronze work, or even heads of marble with eyes of precious stones, and such like are exceptions and change nothing in the principle; then the colored painting of a statue is something barbaric and belongs always to the period of transition. The corporeity and the hardness of the material, as well as the single color, limit principal sculpture in its production and point the same irrevocably to the statue and figures, denying to the same the physical life, the world of sensibility, and, namely, of deep passions. The eye is yet closed and dead; the soul does not speak through those bright stars. The eyes closed, which is only missing on few figures, is an indication for the whole manner in which the plastic forms. Not bodies in imitation of nature she desires to make, but figures—idealized, spiritual, and godlike. So is the outline of the plastic art the ideality, which, not considering accidentalities of single persons, conditions the image in her eternal duration and pureness. Partly and seemingly dessication from this highest axiom will afterwards be referred to.

Selecting a group, there can come to expression a situation or a conflict, since the position and relation of the single figures to each other can speak and point to an action, or they all can be united to a common idea, as the former, *i. e.*, in the group of the Farnesian bull, and the latter in the group of Neobe and her children, is the case. The single statue will always bear the character of "in itself" sufficient.

But the plastic possesses more, as in the group the means to show actions and situations, namely, in the raised picture, the relief which, from the complete fullness of the space, is already set back from the surface, and by a slight raising and lifting off of the bodies from the background, giving to the same the semblance of a full appearance. Besides the statues is here the representation of other things possible, as trees, buildings, implements, and such like; and the plastic finds here an expansion of her domain, outside and above her original limits, without, however, taking away from her the conditions of bodily matter, and points hereby to the possibility, by extensive training, to an art which is equipped with farther-reaching means, and which is

XXVII. THE ART OF PAINTING.

This art abandons the bodily of the art of building and sculpture, and sacrifices the real actuality, whose semblance she reaches and again obtains, by a delusion or by other means. She is set back in the surface, the plain or curved, and her means of representation is the color. As the things appear to the eye, which only can be seen from a point, and that only from one side at the time, so she would let the same also appear in the picture. If we, in the rear of a visible object for the eye, the front side of the thing would set up a perpendicular wall, then this would represent the

ground plan of the picture; but the plan is filled up with the visible front part of the things, and, indeed, so that those being farther back in the space appear smaller, as they actually are. This semblance is reproduced in the picture, and is designated with the name of "perspective." A work of painting is, therefore, the presentation of objects on a plane, which, by means of color and perspective, produces the semblance of reality, naturally understood under the general condition of a work of art.

By the possibility to represent in an unlimited manner the whole extent of reality, painting possesses in the same time the means to bring to view the inner feelings of the soul, the tender, soft emotions, general ideas of the most affecting modesty to the highest magnanimity, as far as they can take in general a visible form. The offers direct a hand for the personification of an idea, and know how to bring the same with astonishing ease to appearance. Color is her stuff and material, and a few strokes drawn with a pencil on paper, obtain first and have only appearance, when the same by the coloring are set off from the paper. The different coloring material used conditions the appearance of the painter's work; then that which is only drawn in one color, on a certain priming ground, will only in part arrive to the semblance of reality, and the same to be tried to be gained by shading and shadows; but that which is executed in many colors, obtains again, by the material condition of the color, a different character. The different coloring material requires also surfaces for painting of a different material. The mode of the color mixing, preparation, and grinding, the spreading and the treatment of singularities, have also a considerable influence on the colored, that is, the color in her artistical effort, that the finest graduations needed everywhere are made possible. In the coloring, painting has an inexhaustible source of representing the most opposite and contrary dispositions, and hardly perceptible shades. Works of painting are divided, partly in reference to the kinds of means used in representing, and partly according to the kinds of the represented objects; but both, as can already be seen, only refer to the outside aspect.

Morecorrect would be a separation of the different works according to the kind of ideas they represent, so that such works which would unite the most important, significant and essential to one group; but such which contain the accidental, momentary, and insignificant, to another group. The first would be named the historical works in the highest and most expanded sense; the latter, to be designated as genera. The dividing line of the two groups will frequently run over and overlap each other, and we will be compelled to divide the same according to the kind and method of painting, as above indicated, or according to the subject treated, such as religious, historical, historic genera, genera, likeness painting, animals, landscape.

XXVIII. RELATION OF THE THREE ARTS TO EACH OTHER.

While the art of building must content itself to give, by indication to their works, the semblance of the organic, while the sculpture has to remain in the outer form of the organic, the painting penetrates to the organism itself, and lays down the deepest connections of the spiritual and objective in one form, which has departed from nature so far, that the same, instead of the natural occupation of space, which the art of building and nature demand, has withdrawn to a surface, and on it, as illustrated before, the semblance of perfect reality made possible. But of the three arts, is the art of building the fundamental and lawful, standing in the forefront, historically and æsthetically before the others: it educates so, as to say, the artistical sense and the art, and makes man capable to feel himself independent to form; and again, to perceive the work of art as something different from the creations of nature. The sculptor, whose hand and skill for work have already been trained in making of building adornments, the ornaments, columns, etc., steps in next, and at the commencement leans closely onto the art of building, whose rooms she adorns and ornaments; but she also wakens to an independent consciousness, and teaches above all others the beautiful proportion and the ideality. The painting, which has perfected itself the last, enters now, opens to art the reality of things and of the soul. The sister arts are supplementary to each other; they finish the circle of the beautiful, as far as visible to the eye. Their principles unite themselves to a higher unit, which every active artist, wherever he may stand, must be conscious of, namely, cannot enough be pointed out to so lively conception of the strict laws of the art of building, which give, well and truly comprehended, everywhere a sure foundation for intuition, judgment, and invention. Through the union of the arts by their works, speaks a higher whole, and only so arrives each to its wordiest position, to the solution of its highest problems. Nothing better and higher exists in the plastic, as the adornment of the sanctuaries of Olympe and Athens; nowhere is painting higher than there, where it ornaments walls and ceiling of a large room, etc.; and where a building shall arrive at a true and real beauty, perfect monumentality and greatness of the sister arts must reach out and assist the wreath of plastic and figurative ornament, as in museums and fine theaters. But as architecture is connected with the building trades, so points painting however by its gift to actions of the souls of men, which only exist in the time to make them visible in space, already to poetry and music the art of sounding. So it could appear, as if the arts overlapped each other—the art of building over sculpture, by the plastic decoration and the statuary ornament, the figurative, forming to painting by the relievo or raised picture to the simple drawing; but nevertheless the boundaries are fixedly drawn and must be strictly kept; then if one of the arts should forget her conditions and her mode of representation, and, going over to the domain of the other next above, her works become unthoughtful, repulsive, and repellent, then the art of building would become individualized, or the sculpture pictures give, then they are not to be approved; their works do not please a refined and cultivated taste. When, therefore, painting draws statuaristic or architectonic, if figurative forming forms architectonic, it is this, anyway, a restraining of the artistical capacity; but the work carries with it severity and dignity.

XXIX. ART AND RELIGION.

It has already been said that a work of art is the reflection of the state of culture of its originator, his time, and of his people, and this, therefore, coming direct from the original self of its originator, he again being rooted with his whole thought and mode of thinking, with his time and with his people. In the different periods of history must, therefore, appear a different kind of art. The main reason lies in the religion of the people; then the religion, since the beginning of the human race, has been that moment and impetus, in which every time and always the highest interests were united, in which the measure or scale for the thinking capacity, the depth of perception, for the striving after morality, the arrangement of state and for personal dignity is given. That religion, more than anything else, separates and unites people, is clear, and needs no further explanation, since every section of history gives speaking proof; and our time itself, which designates partly a beginning, where the positive religious being passes over to the liberated humanity, is rich in such examples.

Art is intimately related to religion; then the impulse after divinity does not satisfy at first a reasonable perception, but it leads much more to the lowest state of all perceiving, corresponding to the sensitive intuition, necessarily thereto, that man tries and endeavors to make himself a concrete presentation of that which his soul desires very much to see. The most sensitive religions begin with elementary objects, such as the sun, fire, and similarities, and pass over to natural things, as trees, animals, and such like. An imposing progress lies then in the taking of personal objects as deities; and, lastly, the personification of a godlike or any ideas referring to divinity in a certain form. This is true for the whole humanity up to to-day, with the exception of Protestantism, as far as they are true to its spirit and principles; then Judaism and the Mohammedans, who discard images of God and set up only hereby a wise prohibition against extravagancies of phantasy; but the Protestantism, that is, as a universal historical idea, and not in the accidental exterior community with the so-called "Evangelists," whereby it is intended to disabuse a misunderstanding against the works of art of eminent, not Protestant artists, is not hostile to art; as to the former religions, he is only from its own inner spirit against the works of art as images of the godly divinity, and repels from it all supernatural; wherefore he only accentuates the purely human and the nobility of humanity. It is a large process of culture, which only one, and that a very small part of humanity, has brought about, laboriously and slowly, and their universal historical sense and their aims are not very difficult to be recognized. The pace of development runs from the sensual creed to the spiritual consciousness.

The more variable and different religions of nations are from each other, so much different are the arts of the same, and consequently the more they come near to each other, the more similar are these. Yet, when many nations are of one and the same religious belief, the difference in the arts will only be recognized and seen in small, insignificant works, which are to be traced to the different perceptions of the same religion through the different characters of the people, and such like. As long as a people has its own religious belief, it has its own national art, and if one and the same religion is in common with more nations, then is art periodical.

XXX. NATIONAL ART OF THE ANCIENTS.

The national art rules the collective antiquity. Here every nation has its own national religion, and art oversteps the boundary of

the people only together with the religion. The types of the old kinds of art are different in their main spirit; and even then, if we believe that some early relation existed between them, we are on the main only authorized to find in them the first impulses to an independent activity within their own nationality. The most important example pertaining hereto is the dispute on the influence which the Egyptian and Asiatic art had on the ancient Greek art. In the face of the monuments, to deny such influence unconditionally is the prerogative privilege of the superabundant Hellenist, when otherwise to trace and pursue the same up to the prime period of the Greek art, to find in all imitations and perfected Egyptian patterns and models, is a preconceived prejudice of those who are incapable to conceive and comprehend the independent people's character. If the old Pelasgians, and, more so, the old Dorians and Ionians, received from the more advanced people the incitation for art exercises, then this is by no means a lowering of the Greek spirit, but sooner a glorification, since they obtained imperfect and raw germs, which, by their own force, were brought to the highest perfection. Something similar executes itself uninterruptedly in all dominions of life, and the judgment here goes from one extreme to the other. At the time of the Roman emperors, as the deities of the different nations and their culture were introduced in Rome, an inclination for a barbaric art was gained, as numerous sculptures of this period, which were executed in the Egyptian style, show. Religion is now undoubtedly conditioned by the natural disposition of the people, their bodily constitution, the formation of their soil, the lay of their country, and similar influences; but it is already formed, in some measure, by the art training of some nominal value, and thus stands in a closed and fixed relation to the same, which is naturally without detriment to any change after time may make with it. So we find perfectly formed religious creeds, which have already called forth a certain fixed art, but which were proclaimed by an interested priesthood as unimpeachable commandments of divinity.

The true reason is the inordinate desire of power and self-interest of the priests, who, by their divine threatening and menace to exclude the people from every and any interest in their religious organizations, and every, even the slightest, attempt in that direction, is punished in the severest way. So originates a perfect stand-still in the religion, and the once created art forms are retained unchanged. Art is therefore under such conditions that the vein of its life is tied and its development played out. In this way it happened that the same unaltered types of art remained thousands of years in Egypt, and the rigid and stiff Byzantinism, longer than five centuries, showed the same lifeless forms.

In the Indias was the appearance of the reformed Buddhisms the cause of a new and less important art, or the one of the Bramaisms, but the Asiatic and African nations, being under the dominion and rule of an oppressing priest religion, their art is, therefore, more or less typically stiff, without any developing progress.

The liberty of the Greeks created the first true art from small, typical, narrow commencement to a perfected beauty. The Romans were, in art and religion, essentially dependent on Greek influence, but by both were taken up in their peculiar national form.

MAKING PROMPT PAYMENT.

Do not hold off because you may for a time, but pay up at once and remove the obligation. It is *our due* and *your duty*.

THE most celebrated carpenter I ever heard of, was the Carpenter of Rouen. You never saw him, but you have seen the ruin of the carpenter, perhaps.—*Builder and Woodworker.*

No, we never did. We never saw a good carpenter ruin anything, but we have seen fellows who pretended to be, that did ruin everything they undertook, including their own and the prospects of good carpenters for profitable jobs. We suppose this class is not common to any one city, but may be found in Rouen, Paris, London, Amsterdam, New York, and all other cities. We certainly don't need any "Rouen" or "ruin" carpenters here.—*Southern Lumberman.*

A COUNTRY SKETCH.

Spoiled Buildings—Owners' Follies and Griefs.

OWNERS are often brought to grief by their mistakes in the means adopted by them to avoid the expense of an architect, and obtain plans for their buildings. Sometimes they know, or become acquainted with some *honest mechanic*, to whom they are induced to intrust the whole matter of plans, specifications, and construction, only to repent it when it is too late. The party to whom the proposition is made, elated with the splendid opportunity opened up to him, and full of conceit in his own abilities, uses all possible means to secure and consummate the arrangement, and plans are made—*and such plans!*—and the work progresses. Once under way, there is no stopping it, and step by step the owner discovers and realizes, one after another, grievous errors, which are difficult to remedy. And when the building is completed, he simply feels disgusted. Imperfect arrangement, poor construction, homely design, and incurable defects crowd upon him, as the reward of his folly; and regrets for his error haunt him day and night, but it is too late—the building is erected, and he must endure its defects. But the first general dissatisfaction is primary and bearable, compared with after experiences in their various details. The plumbing work has, perhaps, been done by some tenth-rate man—some spoiler of good materials—for there are, in San Francisco, some of the least qualified men to be found in the United States, who call themselves "practical plumbers"—men who have not the slightest idea of what constitutes a really good job, not to say first-class. Nor would the payment to such men, of ten times the value of the work done, secure skillful workmanship at their hands, for the simple reason that they do not possess, and therefore cannot practice, mechanical skill and abilities. And owners who employ this class of plumbers are unfortunate, indeed. But to continue, defects show themselves in all connections. Pipes are put in of insufficient capacity, wastes entirely too small, and sometimes so cramped in making bends as to diminish their practical size one-half; "tinker" instead of "wiped" joints; leaks at various points and places; wetting and spoiling ceilings and walls, and not unfrequently carpets have to be torn up to escape the deluge. All this is followed by a still more serious defect—one affecting the health and lives of the occupants, viz., imperfect or insufficient traps, pipe ventilation, bad sewerage, etc., resulting in the distribution of the vicious and poisonous sewer gases through the building, and, as a consequence, the ill health, and sometimes *premature death* of loved ones. The intended pleasant home is thus transformed into a mere fume-castle, a disease-breeding charnel-house, not fit for human habitation. All this is followed by continual repairing, tearing up floors, removing finishes to get at concealed places, etc.; and for all this the owner has been made to pay a good round price, amounting to more, as a rule, than it would have cost him to have secured a good building, erected under the superintendence of a trustworthy architect. But bad plumbing work is not the only serious defect which so often occurs in such cases. The foundation is often wholly insufficient, and settling occurs, with any quantity of ugly cracks in the plastering. The structure is perhaps so poorly braced that the edifice trembles with every wind that blows; and, when the rains fall, leaks are found at every exposed window and opening, and the roof itself yields its proportion of internal wettings. But we will not continue our enumeration of "bad things," as to do so would consume columns of space. Such cases are known to all architects, and many a "served him right" is indulged in, upon the principle that a competent physician laughs at the sufferings of a patient whose pains and agonies result from self-treatment or quack practice, and the educated lawyer smiles when his client gets himself into a *terrible fix* by intrusting his case to some pettifogger, or who tries to work out the intricacies and problems of law by his own self-conceived legal ingenuity.

Landlord's Liability for Bad Drains.

The old question of the responsibility of a landlord for the defective drainage of a house which he had let to a tenant came again before the High Court in the case of Bartram *vs.* Aldous, which was the first case tried before Mr. Justice Grantham. The case is specially instructive, as the fact of the house being in an unsanitary state was not disputed. Evidence, which was admitted to be accurate, was given to show that the waste-pipes from the bath-room opened direct into the main sewer, and that the house-drains were untrapped. The natural consequence was that sewer-gas escaped into the house, and the tenant's family became ill. Under these circumstances he refused to pay two quarters' rent which was due, and brought a counter claim for the damages which he had sustained through becoming tenant of a house which was uninhabitable.

By English law a landlord who lets a house does not ordinarily warrant that it is fit for habitation. The tenant is supposed to make inquiries, and ascertain the material facts for himself; and if he makes a bad bargain, so much the worse for him. The fact of the drains being defective, of itself, affords no answer to a claim for rent, and Mr. Aldous was obliged to rely on a representation which he alleged the landlord to have made at the time of letting the house, to the effect that the drains and water-supply were both perfect. On the question of this representation having been made there was a conflict of evidence, and the jury gave their evidence in favor of the landlord. Whether this verdict was right or not is a matter which does not concern us here. The case shows plainly that a tenant of an ordinary house cannot, *after he has made his bargain*, impose on his landlord the additional liability of providing proper drains. There are, no doubt, exceptions to this rule. It has been decided that a landlord who lets a *furnished* house, impliedly warrants that house to be fit for habitation, and that he may therefore be liable to pay damages consequent on its not being so. The Housing of the Working Classes Act of last year, 48 & 49 Vict. c. 72, sect. 12, also provides that in any contract "for letting of habitation by persons of the working classes, a house or part of a house, there shall be implied a condition that the house is at the commencement of the holding in all respects reasonably fit for human habitation." Neither the Legislature nor the judges have seen fit to incorporate any such condition into contracts for the letting of houses of a superior class, and there the intending tenant must protect himself. This he can do by having the house surveyed before he becomes tenant, when, if his surveyor is competent, any gross sanitary defects are likely to be detected. He might also insist on the insertion in his lease of a covenant by the landlord that the drains, etc., are, and shall be kept in a proper condition. Such a covenant is at present unusual, and the landlord's solicitors would probably for that reason object to its insertion. But if the intending tenant insisted, and the house was in such a state as to comply with the requisition, the covenant would most likely be conceded; if the landlord's agents persisted in refusing, that fact should certainly be sufficient to raise a suspicion that the house was not altogether fit for habitation. Too often landlords let, and tenants take houses without giving any real thought as to their sanitary condition. Greater attention at the time of letting to the duties and to the risks which they respectively incur, would save many disputes and much subsequent unpleasantness, and would be beneficial to the health of the community.—*Sanitary Record.*

La Semaine des Constructeurs publishes a short note upon a matter of considerable importance to builders. So far as we can gather from the note, a contractor agreed with the officials of a certain town to construct a building in accordance with plans and specifications offered him on behalf of the town. He carried out his contract to the letter, but after the building was completed it showed signs of weakness, and the contractor was called upon to make the work good. He defended himself on the ground that he had faithfully carried out the plans and specifications, and proved that he had done so; but the highest court in France decided that, notwithstanding this, he was bound to make good the defects which had appeared in the building, for the reason that he had neglected to inform the town officials of the improper character of the materials specified, and to warn them that it would be impossible to do good work with them. This decree, which was given by the Council of State on the second day of last April and is reported in the journal *Droit* of the eleventh, will surprise those contractors who think it business-like to conceal their knowledge of defects in plans or specifications in the hope that they will be able to get a good price later for extra work in changing the work done in accordance with imperfect documents, but there can be no doubt that it expresses the general policy of the law. As applied to architects, this policy requires that the client should be clearly informed of the inconveniences or risks which would be incurred in following out his instructions, if the architect, knowing of these inconveniences, would free himself from responsibility for them. Before the law, the architect is always the adviser of his client, and is bound to advise him faithfully. In the absence of explicit instructions, and even, to some extent, in opposition to them, he is clothed with a very extensive authority in directing the conduct of the works which are placed in his charge, and in return for the discretion which the law allows him he is obliged to assume a proportionate responsibility. The client may, in unmistakable terms, take this responsibility away from him, but interference with the architect's work, and even the giving of contrary orders, will not have the effect of shifting the responsibility for the building from the architect to the client unless the former takes care to warn his client against the possible consequence of his actions, so far as he can foresee them.

Paint, Putty, and Piety.

"Mr. Editor: I wish you would say a word about putting one's religion into one's work. Last year I built a new house, and employed a Christian man to paint it. He makes good prayers at the prayer-meetings, and utters a good word of advice to the young. But in his work he failed to exercise the same degree of moral sentiments, and did not fill up the nail holes in many parts of the work, and did not paint the top edges of the upper story, and other places which could not be seen from below, but which as much, or more, needed painting. He took care to slight the work just where he thought it could not be discovered, and the nails not being puttied, they caused leaks, which led to a detection of his neglects. I have discounted that man's piety and prayers, ever since. Perhaps this painter treated me as he did because I am a woman and a widow. Any way, I prefer Christians who fill up the holes with putty, and paint the top edges.

"Lady Friend.

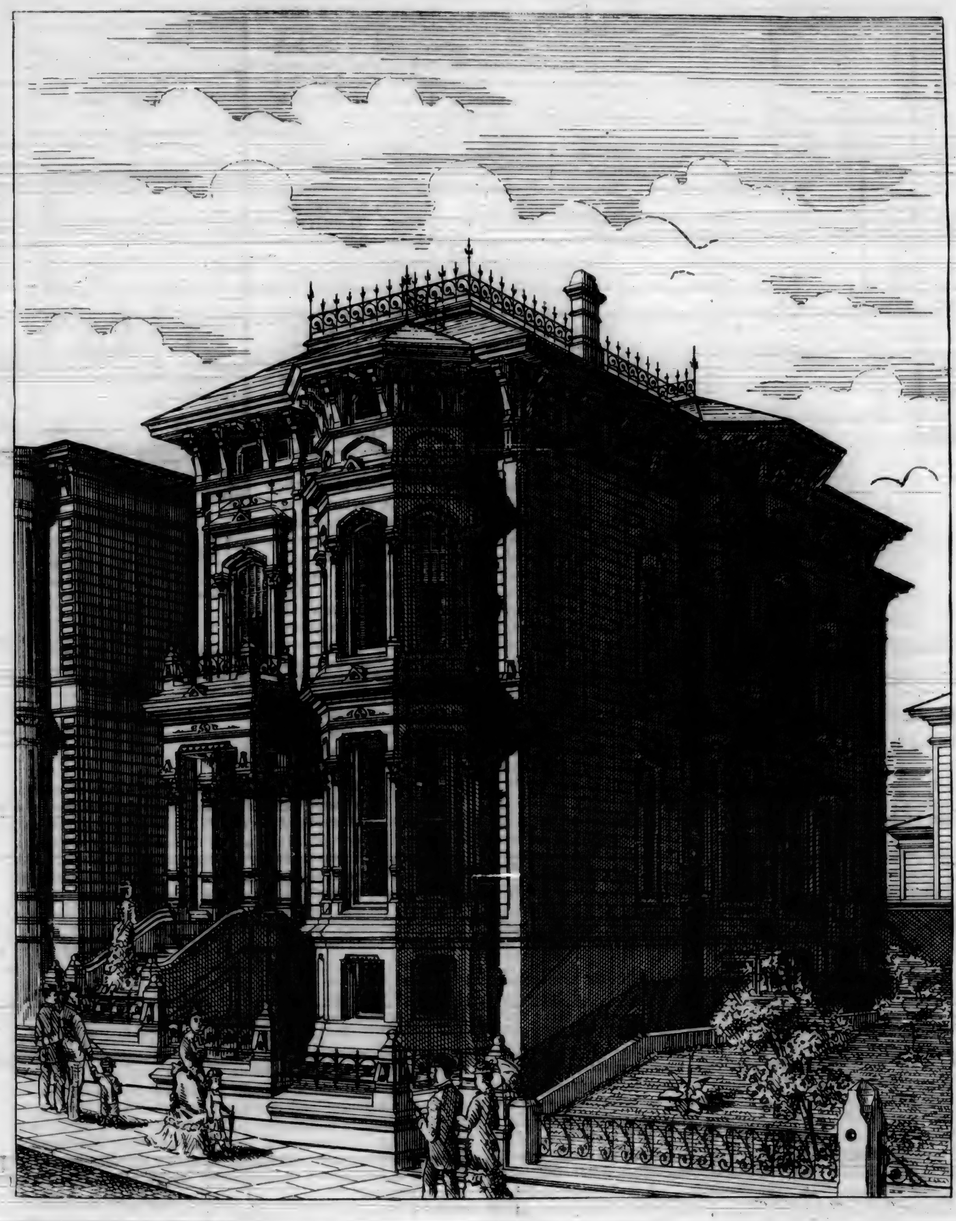
"Our lady correspondent has said quite as effective words about putting one's religion into one's work, as we could possibly say. And our friend is right; you Christian painter, how could you let those nail holes go unputtied, and those top edges and places which you imagined would not be detected, go unpainted? Was it Christian-like? Was it manly? Was it honest, particularly toward a woman—a Christian sister? We advise painters who pray and talk well, to putty and paint well; for right doing is better than right talking and loud praying. We want Christian painters who will fill up the holes with putty, and paint well the upper edges." (An Eastern editor's criticism on above.)

And the California Architect and Building News adds: This is severe on Christian painters. By-the-by are all the painters in San Francisco, Christians? If *none* but Christian painters leave nail holes unputtied, and upper edges, roof gutters, and parts not easily seen, go unpainted, Christianity is certainly in the ascendancy among San Francisco painters, and extensively represented in our midst. The lady brings no charges in reference to the character of stock used by the Christian painter. It may have been pure lead and oil. San Francisco Christian (?) painters sometimes don't use those ingredients—soap, potash, whiting, etc, are cheaper, and owners often want cheap work, and they get it. We have known painters in this city whose Christianity and piety have not been brilliant nor self-evident, and their prayers—sort of ejaculatory expressions—prefix to sentences, beginning with the letter d, who have—well, never mind the rest, we won't repeat, they call it paint, painting, and pure stock!

A very simple test to ascertain whether the air of any apartment contains sewer gas is made by saturating unglazed paper with a solution of one ounce of pure lead acetate in half a pint of rain water; let it partially dry, then expose in the suspected air. The presence of sewer gas in any considerable quantity soon darkens or blackens the test-paper.

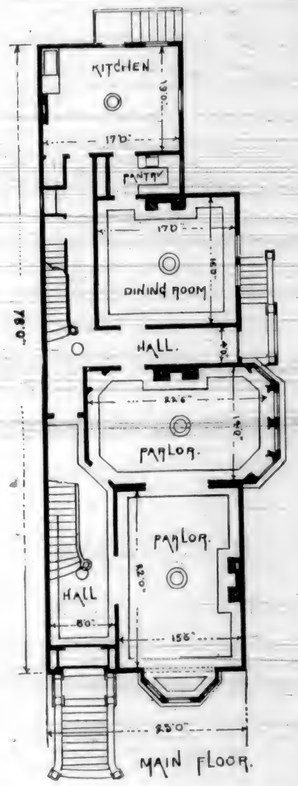
Two ounces of soda dissolved in a quart of hot water will make a ready and useful solution for cleaning old painted work preparatory to repairing. This mixture, in the above proportion, should be applied when warm, and the woodwork afterward washed with water to remove all traces of soda.

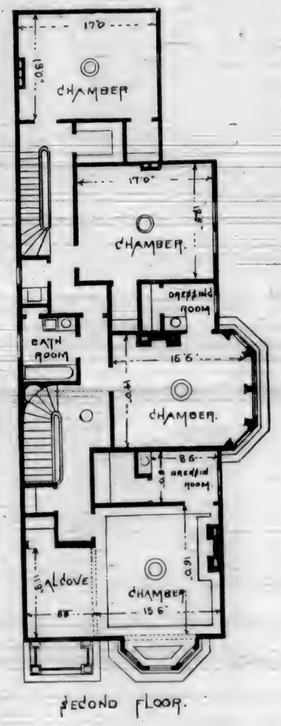
We carry a full assortment of architectural publications, and are prepared to forward to any address copies of any work published, at lowest market price.



A Representative San Francisco Dwelling.

The above cut and accompanying plans on opposite page aptly represent the average architecture of a dwelling intended for those who move in the well-to-do walks of life. Although the design is intended for any location, still the building appears to better advantage when placed on the side of a hill. The exterior is in perfectly good taste, without any attempt to clap on the *balderdashnian* styles commonly but erroneously styled as Eastlake, Queen Anne, etc. When finished as per plan, the beholder is at once struck with the solidity, clean-cut finishes, and the general well-to-do appearance of the structure, thus establishing at once the owner as a practical business man. The general plans, and arrangement of the rooms on the different floors, will well repay a careful study. The first thing observed is that no waste room exists in the house; no dark closets to bother the careful housewife; in fact, while studying the general plans, you are at once impressed with the general compactness in the whole arrangement. This feature especially recommends itself to the lady of the house, as it requires much less work to keep the various rooms in the *shining dollar order*. Notice the basement; it extends under the whole house, and is





amply lighted in every portion by numerous windows judiciously placed. Servants have a careless fashion of disposing of old boots, bottles, worn-out umbrellas, and all sorts of trash in the dark holes of the basement; but in the plan as laid out, no chance exists for receptacles of the stuff that should only find a place in the ash barrel that is emptied regularly by the proper person.

Should it be desired to heat the house by steam or hot water, ample room exists in basement for a furnace room.

The billiard room is large and convenient. Should more light be required, extra windows can be placed each side of the chimney. There is also ample room for a children's ten-pin alley between the billiard table and the hall partition. If so used for this purpose, care should be taken to have the flooring of extra good quality.

The partitions in rear of the billiard room can be either plastered, or made of tongued and grooved boards planed both sides. The latter gives more room and answers every purpose.

The main floor plan is at once suggestive of compactness and convenient arrangement. Should it be desired, the sliding doors in parlors may be done away with, and the opening arranged for a *portiere*. While we do not advocate the use of portieres between a hall and parlor or dining-room, still between two such parlors as shown in engravings, we think they are much preferable to sliding doors. The latter will every once in a while get out of order, but the former having none of its portions concealed from view, will last as long as—a good housewife informs us—as long as the stuff of which it is composed is in fashion. According to this lady's authority, portieres are like fashions in dresses, to be changed as often as the purse will allow.

The dining-room is so situated that no smell from thence can permeate into the parlors, the intervening hall proving an effectual barrier. The latter is an especial feature in the arrangement of the main floor; by its use you have access to yard, basement, parlors, and upstairs; the door in main hall effectually divides the front and rear sections, and cuts off completely all danger from the smell of cooking, etc., ascending to the second floor. All such doors should be provided with self-closing springs, so as to guard against their being accidentally left open by careless servants or the future heirs of the master of the house. No cornice is shown in rear hall, that being a matter solely regulated by the owner's purse. The kitchen is well lighted, and is handy of access from hall and yard and also convenient to the basement, which is reached by stairs both from outside and inside. Pantry is large, and is provided, as shown, with a sink, shelves, and drawers.

Much care and study have been exercised in the arrangement of the second or bedroom floor, so that suitable and convenient spaces may be had for beds, bureaus, chairs, tables, etc. Many designs have been presented to us as individual owners' studies, representing plans that would suit said owner's ideas to perfection, and yet, after a little talk, they have been either torn up or thrown into the waste basket. The *first* duty appears to have been either the *last*, or not thought of at all, viz., the arrangement of the room for the proper disposal of the furniture necessary for the uses to which the room is to be subjected. Take the front chamber in plan. The alcove at once suggests the proper place for a bed. The largest size of a double bed is not over 5 feet in width. The alcove is 11 feet 3 inches in length. Thus over 3 feet each side of the bed is left for such purposes as the occupant of the room may desire. Between the chimney and bay window there is a suitable space for a bureau, organ, book-case, lounge, or any other article of furniture. The best place for a bureau is in the dressing room between the window and wash-stand. If placed there, the space in front room as mentioned can be used for a large looking-glass, by which ladies can see their full dress uniform to advantage. It will also be noticed that room on the walls is abundant for the hanging of pictures, etc.

All the other rooms are equally convenient, being so arranged that, when furnished, they will present an appearance at once indicative of home comforts.

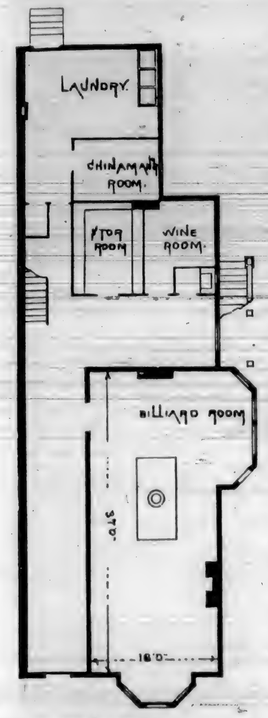
The attic is large, well lighted, and ventilated. The large room can be used as a dance hall or for any other purpose which suggests itself to the mistress. The tank room—easy of access—is located in one corner, thus doing away with the hot water boiler in kitchen. As arranged by us, the tanks present a vast superiority over the copper boiler; plenty of hot water is always to be had whenever a reasonable fire is kept up in the range. A window in the room gives light, and—what is absolutely essential—plenty of air, so that the water may be thoroughly aerated.

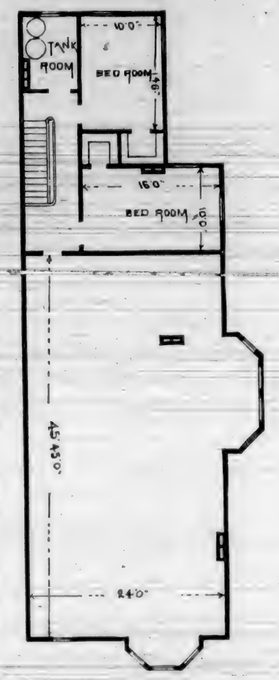
Having presented a general description of the house as shown by the engravings, we will add a few hints suitable for those intending to build or occupying a house after its erection.

When you have determined to build, the first thing to be done is to go to the best architect within your reach and consult him as to the most expeditious method of reaching the result desired. Do this before consulting any builder or contractor, and you will invariably find it to your advantage. The reason is plain. The architect stands as a disinterested third party between you and your mechanic, he having made a special study of the arrangement and convenience of modern structures, and, being constantly employed in designing such, is better versed than any one else you could find. In selecting your plan, give the architect a short synopsis of what you consider best adapted to your wants, and the amount you desire to expend; then let him work the design up and submit it to you for inspection, which will enable you to see and correct all which does not suit you, and your house, when completed, will come up to your expectations.

Painted woodwork may be classed among the necessary evils of house decoration. No one in his sober senses will put paint on good woodwork if he can get an equal effect by the use of natural wood. But the costliness of all hardwood, and especially the expense of working it, renders the use of pine practicably inevitable.

A kitchen and its belongings should not be planned solely for the comfort or ease of the cook, but for the general health of the household, for the purer the air below the purer will that be which circulates above.





Mortar and paint may be removed from window glass with hot, sharp vinegar.

Grained wood should be washed with cold tea, and then, after being wiped dry, rubbed with linseed oil.

Remove flower-pot stains from window-sills by rubbing with fine wood ashes and rinsing with clean water.

Strong brine may be used to advantage in washing bedsteads. Hot alum water is also good for this purpose.

Oil-cloths should have a coat of varnish applied once in six months, after being scrubbed with hot soap-suds and thoroughly dried.

Plush goods and all articles dyed with aniline colors, faded from exposure to light, will look as bright as ever after sponging with chloroform.

Soot falling on the carpet from open chimneys, or from carelessly handled stove-pipes, if covered thickly with salt, can be brushed up with out damage to the carpet.

Carpets should be thoroughly beaten on the wrong side first and then on the right side, after which spots may be removed by the use of ox gall or ammonia and water.

Whole cloves are now used to exterminate the merciless and industrious moth. It is said they are more effectual as a destroying agent than either tobacco, camphor, or cedar shavings.

A good moth powder is made of lupuline (ground hops) one dram; Scotch snuff, two ounces; camphor gum, one ounce; black pepper, one ounce; cedar sawdust, four ounces. Mix thoroughly and strew among the furs and woolens to be protected.

Furniture needs cleaning as much as other woodwork. It may be washed with warm soap-suds quickly, wiped dry, and then rubbed with an oily cloth. To polish, rub it with rotten-stone and sweet oil. Clean off the oil and polish with chamois skin.

A cheap paint for a kitchen floor, that will save much work in cleaning, can be made with five pounds of French ocher and a quarter of a pound of glue dissolved in two quarts of boiling water; then apply enough boiled linseed oil to make the paint flow easily from the brush.

When hard-finished walls have been calcimined, the soiled coats should be washed or scraped off before a new one is put on. This is the most disagreeable part of the process. The furniture should be covered, as the lime makes spots that are removed with difficulty, especially upon black walnut.

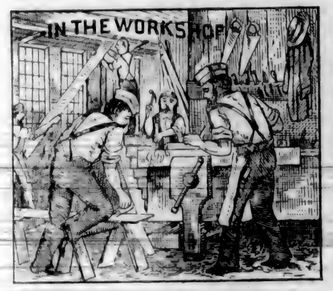
To clean marble the following is recommended: Common soda, two pounds; powdered pumice-stone and finely powdered chalk, one pound each. Pass through a fine sieve and mix to a thin paste with water. Rub it well all over the marble and the stains will be removed; then wash the marble over with soap and water and it will be as clean as it was at first.

Build with seasoned timber, or you will build to your own discredit and others' loss.

After the dust has been thoroughly beaten out of carpets, and they are tacked down again, they can be brightened very much by scattering corn meal mixed with coarse salt over them, and then sweeping it all off. Mix the salt and meal in equal proportions.

Ladies the Best Planners.

In many particulars in connection with the comforts and convenience of family residences, the mistress often displays better judgment than the master. Nor is this fact at all strange. If the lady is observant and intelligent, her continued experiences and contact with the general arrangement of home more fully qualify her to comprehend alike the convenient and practical, and the objectionable arrangements met by her in home experiences, and gathered in the course of her visits among friends. Sometimes men are obstinate, and refuse their wives the privilege of any say in the matter—following their own views in all things; but, as a rule, better and more satisfactory results are reached, when the opinions of an intelligent wife are at least consulted. Although some architects "don't want anything to do with the women," yet it is questionable whether every man in the profession who enjoys the patronage of female clients, either as wives or sole owners, has not received from them many sensible and practical suggestions; and it is perfectly reasonable that it should be so; for while the architect may fully understand the theories and principles of architecture in every phase and department, he cannot understand the detail workings of his plannings, except so far as he may have "tested them" in some special manner; while the women-folk are brought in hourly contact with all defects or perfections that exist, and are thereby the better qualified to at least express an opinion. In addition to this, it is an incontrovertible fact, that many ladies enjoy much better general ideas of planning buildings than do their husbands; not because the husband lacks good intelligence and business capacities, but for the reasons already stated. Home and house experiences on the part of the wife, and the intense desire and determination on her part to have everything just as it should be, naturally qualify and leads the mind to right conclusions. With all the objections urged by some, to women interfering with such matters, if the many little details of occurrences that transpire during the period in which the "talking over" of plans is indulged in between man and wife could be discovered, perhaps there would be but few well-arranged houses found not to a large extent shaped by the mind of woman. For from the hour when the husband reveals an intention to build, the wife, as a rule, enters heartily into the proposition, and she at once commences to study up her part, not only so as to secure for herself all of the little conveniences of arrangement which would never be thought of by the husband, but to make the house generally as perfect in detail as the amount of money to be expended and "best judgment" will accomplish. Consequently, in the repeated discussions which ensue, the wife introduces this, and that, and the other feature, until by the time a final conclusion is reached, first thoughts are materially changed, and, to a greater or less extent, the wife's ideas and suggestions permeate almost if not quite every arrangement of the building.

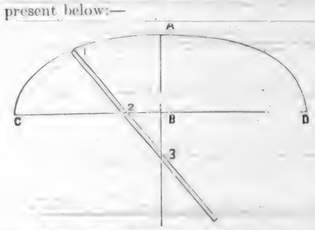


We will be pleased to receive for publication in this column items of information in regard to practical ideas connected with the mechanical part of the building trade. We especially invite suggestions from apprentices and young mechanics.

Business Manager Architect: Will you please illustrate a method for drawing the *half oval;* one that will apply to making an elliptic on a large gateway?

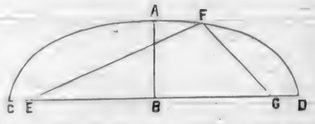
Palo Alto Farm.

Answer.—There are many methods by which the required curve can be made. One of the oldest, as well as simplest, we present below:—



Let C D be a given distance, and A B a given height. Take a straight edge; from the end of this set off 1 3, equal to the distance C B, and again, set off 1 2, to equal A B. Now lay the straight edge on the line C D, with 1 at C. Then, with a pencil, make any number of points, all of which will be in the curve, by moving the straight edge, keeping 3 on the line A B, and 2 on the line C D.

Another simple way is represented by the adjoining cut:—

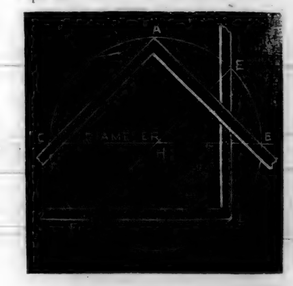


C D being any distance, A B any height. Mark two points on C D, as at E G, to correspond to the distance C B or B D, using A for the center. In these two points put a pin or nail. Tie a string at E, stretching it over the point A, and fastening at G. Now, with a pencil in which a groove has been cut, to prevent slipping, sweep the curve.

Let no building workman be too proud to take a hint from the humblest laborer that attends him, for the experienced looker-on betimes sees more than the doer.

Artificial like natural drainage, is governed by gravitation, and the absence of a proper fall in either is as opposed to nature as a swamp is to health.

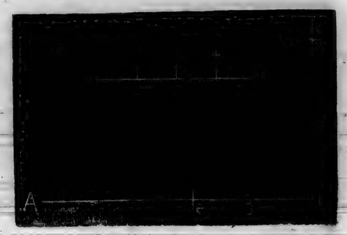
How to find the diameter and center of a circle with the square:



This cut shows at a glance how the diameter and center of a circle can be found. Place the square as shown at A B C. The line B C will be the diameter. Place the square so that the point of the square A will touch any other point of the circle, as at D; draw E F. The point of intersection, H, will be the center of the circle.

J. C. is informed that no regular rule can be laid down for the projection of cornices on buildings. Much depends on the style of architecture employed. To use a general rule, however, we might say that for a building seventy feet in height, the proper projection should be about thirty-six inches.

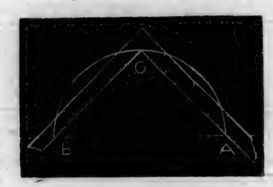
A correct mechanical method by which two fences can be set at right angles to each other:—



From any scale of equal parts, as that represented by the line D, which contains 5, set off from B, on the line A B, the distance B e equal to three of these parts; then from B, with a radius equal to four of the same parts, describe the arc a b; also from e as a center, with a radius equal to five parts, describe another arc intersecting the former in C. Lastly, join B C; the line B c will be perpendicular to A B.

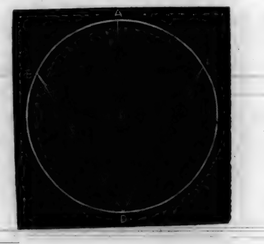
This mode of drawing right angles is troublesome on paper; but in laying out grounds or foundations of buildings it is often useful; since, with a measuring rod, line, or chain, perpendiculars may be set out very accurately. The method is demonstrated thus: the square of the hypothenuse being equal to the sum of the squares of the other two sides, the same property must be inherent in any three numbers of which the squares of the two lesser numbers added together are equal to the square of the greater. For example, take the numbers 3, 4, and 5; the square of 3 is nine; the square of 4 is 16; 16 and 9 added, make 25, which is 5 times 5, or the square of the greater number. Although these numbers, or any multiple of them, such as 6, 8, 10, or 12, 16, 20, etc., are the most simple and most easily retained in the memory, yet there are other numbers, very different in proportion, which can be made to serve the same purpose. Let n denote any number; then n^2+1, n^2-1, and $2n$, will represent the hypothenuse, base, and perpendicular of a right angle triangle. Suppose n equal 6; then $n^2+1=37$; $n^2-1=35$; $2n=12$. Hence, 37, 35, and 12, are the sides of a right angle triangle.

How to make a circle with a square:—



Drive in a nail at the points A and B. It is better to use a "French" nail, as, being round, the square slips easily. The nails evidently cannot be farther apart than the length of the "*tongue*." Place the square in the position indicated in the cut; and with a pencil held firmly in the crotch at C, and the square kept on the nails, a circle can easily be drawn.

A simple way to describe an equilateral triangle within any given circle:—



Upon any given point A in the circumference, with the radius A S, describe the arc B S F. Draw B F. Make B D equal to B F. Join D F. B D F will be the equilateral triangle required.

Friend Architect: Please tell me how to compute the number of joists it takes in a building when spaced sixteen inches from centers?

Amateur.

Answer.—Multiply the length of the building in feet by 3, and divide the product by 4. For instance: the building is 124 feet long = $124\times3=372\div4=93$, the number of joists required. This rule is applicable, no matter what the thickness of joists may be, as long as they are spaced 16 inches from centers. Allow one extra, except when the end sills are utilized in place of joist. Of course deduct when the latter is the case.

Business Manager Architect: How many pounds of lath nails does it take to put on 1,000 laths?

Answer.—There are 420 lath nails in a pound. So 11 pounds is what you will require for 1,000 laths.

ASKED, ANSWERED, AND COMMUNICATED.

☞ Architects, Contractors, Carpenters, and Mechanics generally are respectfully requested to furnish us items of interest for this column. We will gladly answer any and all questions pertaining to the architectural and building interests. If illustrations are necessary to explain your ideas, send us a sketch of them and we will make the cuts.

Free to All.

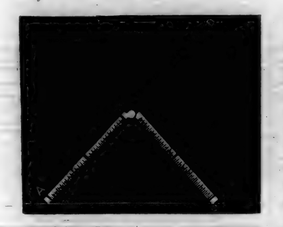
The columns of this journal are open to all who differ with us upon any subject presented. We are too old in years and experience to assume that we have passed the reef of human infirmity to arrive at the moment to suppose that we have reached the realms of thought where perfection reigns supreme. But this we do assure—that whatever of error there may be contained in our columns will be speedily corrected, as soon as attention is directed thereto, and we are convinced of the error. We will give place to a reply in any case, when a mistake or wrong statement has occurred. It is our desire and purpose to be fair, just, and correct in all things, and do no person or subject any violence. We therefore invite free discussion and criticism, and again state that the columns of this journal are at the service of all who desire to differ with us upon any theory or subject, or who take exception to anything at any time appearing in our columns.

Editor Architect: What is the exact height of Mount Diablo?

Oakland.

Answer.—According to Professor Davidson, it is 3,843.63 feet above tide level.

To square a board with a pocket rule, no square being necessary:—



Apply the rule on the board as shown by the engraving. Make a dot at the point C. With the left hand hold firmly that part of the rule denoted by A B, and with the right hand extend the rule as shown by the letters A B D. Draw a line through the points C and D, and it will be found to be exactly at right angles to the edge of the board. It is evident that the above method may be employed, using the rule at any angle.

The Chinese Must Count.

The Chinese have a most ingenious method of reckoning by the aid of the fingers, performing all the operations of addition, subtraction, multiplication, and division, with numbers from one up to 100,000. Every finger of the left hand represents nine figures, as follows: The little finger represents units, the ring finger tens, the middle finger hundreds, the forefinger thousands, and the thumb tens of thousands. When the three joints of each finger are touched from the palm towards the tip, they count one, two, and three of each of the denominations named. Four, five, and six are counted on the back of the finger joints in the same way; seven, eight, and nine are counted on the right side of the joints from the palm to the tip. The forefinger of the right hand is used as a pointer. Thus, 1,234 would be indicated by first touching the joint of the forefinger next the hand on the inside; next, the middle joint of the middle finger, on the inside; next, the end joint of the ring finger, on the inside; and finally, the joint of the little finger next the hand, on the outside. The reader will be able to make further examples for himself.

In putting up your screen doors and windows be very particular to have a little hole in one corner so that the flies can go outdoors when they get tired of being inside.

Waxing Floors.—The following is a good recipe for waxing floors, and the method of application. Stir twenty-five parts of shredded yellow wax into a hot solution of twelve parts of pearl-ash in soft water. Keep the mixture well stirred until the effervescence ceases, then remove it from the fire and stir in twelve parts of finely-ground yellow ocher. It may now be poured into cans to cool. When wanted for use, one part of it is dissolved in five parts of boiling water. Apply warm with a paint brush. It dries in a few hours, when the floor is polished with a floor-brush, and afterward wiped with a woolen cloth. It is said this wax coating will last for six months with ordinary use.

Queen Anne Hodge Podge.

Architect—Well, I declare that is a pretty fair house plan for an amateur, only you have left no space for stairways and closets. Did you make it yourself?

Prospective Builder—Yes, but the only thing that puzzles me is to know what style of cottage it is. It is not Gothic, nor Italian, nor—

"No, it is absolutely nothing. As to style, it is simply a meaningless hodge-podge, to be frank with you."

"Well, what shall I call it, have you no name for hodge-podges?"

"Oh! yes. We call 'em Queen Annes."

The Very Latest.—A man out West bought a bedstead, the wood of which was so green that one warm spring day it broke out all over with little groves of waving branches. In autumn the children picked the chestnuts from the side pieces, and the next spring tapped the headboard for maple sugar.

Don't.—Don't call a very large, stro g, sinewy man a prevaricator. If you are sure he is a prevaricator, hire another man to break the news to him.

Glycerine Glue.—A German chemist has discovered that the strength of glue is very greatly increased by the addition of one fourth as much glycerine as glue. Glycerine has many other uses, among which one of the least known is its property of removing pencil marks from paper in a very perfect manner. It may also be combined with starch and plaster of Paris, to form one of the most durable cements for various kinds of apparatus.

There is nothing so tends to shorten the lives of old people, and to injure their health, as the practice of sitting up late, particularly winter evenings. This is especially the case where there is a grown-up daughter in the family. This sanitary item is published at the request of several young men.

To remove iron taste from new kettles, boil a handful of hay in them, and repeat the process if necessary. Hay water is a great sweetener of tin, wooden, and ironware. In Irish dairies everything used for milk is scalded with hay water.

A rubber cushion under the legs of a work-bench will deaden the sound of hammering so completely that it will not disturb the inmates of adjoining rooms.

What has become of the straw lumber which, three or four years ago, we were told would revolutionize the lumber business?

One of the most important features in an interior arrangement is the actual and relative height and width of doors and windows. The question is whether the apparent proportions of apartments cannot be greatly modified by the treatment of the necessary openings. A window in the center of one side of a room gives more light than if at one side of the center, but it has the effect of shortening the length of that side. The same is true of doors in similar positions. The higher a window is the more light it will give, but the lower the room will appear. In doors, nothing is gained by increasing the height beyond a proportion to the width that shall prevent a stunted appearance. Their relative height to that of the windows is a nice question of balance that can be best determined by experience.

Wood may acquire an oak, walnut, or cherry tree color by staining it with ordinary tincture of iodine diluted with spirit until the exact shade is obtained. White shellac must be added to the iodined solution if the stain is to be made permanent, or the wood after the stain is applied may be French polished. The iodine may be laid on with a rag or a brush.

If stove polish is mixed with very strong soap-suds, the luster appears immediately; consequently there is less dust to breathe and blacken.

Editor Architect: How do you cut a hip-rafter? and oblige

Sonny.

Sacramento.

Well, Sonny, we have always used a *saw* for that performance; but if you want to know a *rule* by which you can cut any kind of a rafter, we will be most happy to inform you.

Sketch of Country House.

THE accompanying sketch will be found a very desirable plan for an attractive farm-house building. No attempt has been made to pile on a lot of mannerisms, in order that the outside appearance may be showy. By a study of the plan, it will be noticed that the house can be thoroughly ventilated by through drafts in every direction. This is a luxury to be appreciated by those living in the interior of California.

The design shown will freely admit of successive additions, in case they become necessary, without marring the beauty of the original plan. In fact, these, when properly designed, add to the variety of outline, and its beauty of light and shade.

To build well, and to do so at a low price, is always desirable; and to build artistically, imposingly, and attractively, does not imply elaborate finish or profuse ornamentation. Sandpaper and decoration will never make an ill-proportioned building attractive to an educated taste, while a rough exterior of harmonious lines and forms will pass current with those who have an eye to the artistic.

WE understand that M. de Lesseps has succeeded in having a large part of his new loan of one hundred and twenty million francs taken up, mainly, it is said, by females of the peasant class. If half that is said about the real condition of affairs at the Isthmus is true, this enterprising enthusiast is likely to prove one of the greatest moral scoundrels of the age, and we do not envy him the objurgations which, when failure is at length acknowledged, will shower upon him. But there are some things which even the magnetic de Lesseps cannot accomplish, and we are not surprised that in face of the doubtful condition of his undertaking at the Isthmus of Panama, the Tunisian Government has refused to allow him to undertake the flooding of the chotts that lie between the coast of the Mediterranean and the great desert to the south of them. M. de Lesseps estimated that the cost of digging the canal that would be necessary for this immense irrigation scheme would be forty million dollars, which he probably looks on as a mere bagatelle, but which the canny Africans seem to believe could hardly be raised by a man who already finds it hard to raise money for the prosecution of an enterprise in which the whole world is interested, and of which the bonds and securities can be bought in any market, if any one thinks them worth the purchase.—*American Architect.*

A LITTLE paragraph has been going the rounds of the technical journals about the painting of tin roofs, which seems to contain a valuable suggestion. Most persons suppose that a tin roof ought to be left exposed to the weather for a month or so, until the iron of the plates has corroded enough to cover the tinned surface with a tinge of rust, probably forced through the pores of the coating. The theory of this notion seems to be that paint will not stick to a fresh surface of tin, which is apt to be greasy as well as smooth, and that the slight roughness given by the rust is of value for holding the paint; but the writer of the paragraph in question believes that if painting is delayed until oxidation has begun, the action continues beneath the coating, until the plates are destroyed, while a layer of paint put on over fresh plates would defend them for an indefinite period from the commencement of oxidation. There is certainly a possibility that this view of the matter is the correct one, and architects, who have many opportunities for observing the weathering of roofs, might do their fellow-citizens a service by investigating the facts with care.

MANY a man who has failed to make a home, or, strictly speaking, a homestead that his children can love, has been doomed to see them leave it, and seek in other places, and amid new surroundings, these satisfactions that have been denied them in what should have been the dearest spot on earth. The charm of a beautiful home would go far to kindle and keep alive that enthusiasm which sustains the soul, enabling it to triumphantly contend against discouragements and obstacles.

THE most afflicted part of the house is the window. It is always full of pains, and who has not seen more than one window blind?

Built-up Timbers.

THE statement that a 12x12-inch beam, built up of 2x12 planks spiked together, is stronger than a 12x12-inch solid timber, will strike the novice as exceedingly absurd. Every millwright and carpenter knows that it is so; at least he has been taught to believe that it is so, whether he ever tested it by actual experience or not. The inexperienced will fail to see why a timber will be stronger simply because the adjacent vertical longitudinal portions of the wood have been separated by a saw; and if this were the only thing about it, it would not be stronger; but the old principle that a chain is no stronger than its weakest link comes into consideration. Most timbers have knots in them, or are sawed at an angle to the grain, so that they will split diagonally under a comparatively light load. In a built-up timber no large knots can weaken the beam except so much of it as is composed of one plank, and planks whose grain runs diagonally to the outside cut will be braced and strengthened by the other pieces spiked to it and having the grain running in a different direction.

MEANING OF "INSOLVENT"—MINNESOTA LAW.—The term "insolvent," as used in the Minnesota insolvent law, applies in the case of a merchant or trader to inability to pay his debts in the ordinary course of business, and not merely to an inability to pay his debts when his affairs shall be ultimately wound up. So held by the Supreme Court of Minnesota in the case of Daniels *vs.* Palmer *et al.*

A CORRESPONDENT of the *Metalworker* complains, and we think with a good deal of justice, about the lack of attention, on the part of architects, to the proper grouping of plumbing fixtures in dwellings. A little more judgment displayed would, according to him, be certain to insure better working and entail less expense in doing repairs than under the prevailing apparently haphazard plan of putting fixtures in the first place that offers. The same correspondent attributes much of the discomfort to the inmates, and the blame which is so often visited on the plumber, to the lack and care bestowed upon the proper grouping of fixtures by the average architect. While in drawing the plans an architect never loses sight of the prominent features of the house—the doors, windows, flues, etc.—the plumbing apparently comes in as an after-thought. He sets down a water-closet, a bath, or a sink just where he thinks most convenient, the last thing entering his mind, if it does concern him, being how the plumber is to get his pipes in proper place. The architect evidently considers that this is the plumber's business, and, as a consequence, the latter is frequently taxed to the utmost to procure proper fall for his waste-pipes, or to so arrange his hot and cold water pipes as will insure them against freezing or bursting in most inaccessible places. The correspondent concludes by saying that if architects would devote some of their ability to the proper arrangement and location of the plumbing work in a house with a view to future contingencies, much of the unnecessary expense and of the odium now resting on the plumber would be avoided.

$7,000.

Caroline, bet. Folsom and Harrison. Two-story frame.
O.—T. H. Hittell.
C.—A. Nelson.
$1,600.

Castro, cor. Seventeenth. Two-story frame.
O.—P. H. Dearon.
C.—Geo. W. Graham.
$2,000.

California, cor. Scott. Two-story and basement frame.
O.—Mrs. E. E. Chase.
A.—Curlett & Cuthbertson.
C.—C. M. Cornell & Co.
$9,000.

D

Devisadero, bet. Eddy and Ellis. Two-story frame.
O.—Mrs. E. Tully.
A.—P. R. Schmidt.
C.—A. Norton.
$2,800.

Devisadero, west side, bet. Post and Sutter. Two two-story frames.
O.—J. H. Jellett & Geo. Leviston.
A.—C. I. Havens.
C.—C. E. Dunshee.
$7,000.

E

East, nr. Market. Two-story frame.
O.—State of California.
Day work.
$1,500.

Eleventh, nr. Howard. Two-story frame.
O.—Wm. Deeney.
C.—J. J. Sweeney.
$1,800.

Eddy, cor. Buchanan. Two two-story frames.
O.—A. Hayes.
C.—D. E. Hayes.
$9,000.

Eddy, nr. Buchanan. Two-story and basement frame.
O.—T. Costigan.
A.—T. J. Welsh.
C.—S. T. Green.
$5,000.

Ellis, cor. Octavia. Eight two-story frames.
O. and B.—B. F. Norris.
Day work.
$17,500.

Eleventh Avenue, nr. Point Lobos Avenue. Two-story frame.
O.—Miss Bella Ryan.
A.—F. Hillert.
C.—Eadie & Rodgers.
$2,090.

F

Fourth, nr. Clementina. Three-story frame.
O.—Thos. Emery & Son.
A.—S. & J. C. Newsom.
C.—J. H. McKay.
$10,000.

Folsom, bet. Sixth and Seventh. Three-story frame.
O.—D. Harrington.
C.—W. E. B. Stiles.
$5,000.

Ford, bet. Sanchez and Noe. One-story cottage.
O.—P. Sheea.
A.—M. J. Welsh.
C.—Doyle & Son.
$2,000.

Fremont, cor. Harrison. Additions.
O.—Father Nugent.
A.—T. J. Welsh.
C.—M. Lynch.
$3,500.

Francisco, bet. Powell and Mason. One-story frame.
O.—Chas. Willmott.
A.—Copland & Banks.
C.—O. E. White.
$2,000.

G

Guerrero, bet. Twenty-fifth and Twenty-sixth. Two-story frame.
O. and B.—F. Vacker.
A.—Wright & Sanders.
Day work.
$4,000.

Greenwich, cor. Bush. Two-story frame.
O.—F. G. Eickhorst.
C.—G. H. Walker.
$3,000.

Golden Gate Avenue, cor. Buchanan. Four three-story frames.
O.—M. W. Smiles.
A.—Wm. Mooser.
C.—John Campbell.
$14,000.

H

Haight, bet. Broderick and Baker. Two-story frame.
O.—J. C. Merryfield.
A.—M. J. Welsh.
C.—Gray & Storer.
$3,600.

Hayes, cor. Ivy Avenue, bet. Franklin and Gough. Three-story brick.
O.—Henrietta Loewa.
A.—C. Geddes.
C.—W. Fletcher
Brick work—G. Richardson.
$14,000.

Hayes, bet. Franklin and Gough. Additions.
O.—H. Winters.
C.—M. McDonald.
$1,600.

Haight, cor. Buchanan. Three two-story frames.
O.—Mrs. Mabel Treadwell.
A.—J. Gash.
C.—T. F. Merrill.
$15,000.

Howard, nr. Fifteenth. Two-story frame.
O.—H. Hilderbrand.
A.—John & Zimmermann.
C.—A. Miller.
$3,800.

L

Lapidge, bet. Nineteenth and Twentieth. Two-story frame.
O. and B.—F. C. Kleebauer.
Day work.
$2,700.

Lyon, nr. McAllister. Two-story frame.
O.—John Tobin.
A.—David Salfield.
C.—H. Inwood.
$1,800.

Larkin, bet. Vallejo and Green. Two two-story frames.
O.—A. Bremer.
C.—Martin & Maguire.
$4,000.

Larkin, bet. Vallejo and Green. Two two-story frames.
O.—Father Nugent.
A.—T. J. Welsh.
C.—M. Lynch.
$3,500.

M

Mission, nr. Second. Additions.
O.—Geo. A. Low.
A.—James E. Wolfe.
C.—Moore Bros.
Brick work—J. Smith.
$6,000.

Market, cor. Ninth. Two-story frame.
O.—J. S. & C. F. Doe.
A.—J. J. & T. D. Newsom.
C.—Thos. H. Day.
$21,495.
The amount $21,495 also includes the three-story frame on Ninth Street near Market.

Mason, bet. Sacramento and Clay. Alterations.
O.—M. L. Kaufmann.
A.—Miller & Armitage.
C.—A. Gilbert.
$1,500.

Mission, bet. Twenty-fifth and Twenty-sixth. Four two-story frames.
O.—John S. Morgan.
A.—Chas. V. Pierce.
C.—J. Bruce.
$12,000.

McAllister, bet. Buchanan and Webster. One-story frame.
O.—F. Younger.
Day work.
$1,500.

Market, bet. Jones and City Hall Avenue. Three one-story frames.
O.—Hyman Bros.
A.—R. B. Schmidt
C.—Mahoney Bros.
$11,000.

Mission, bet. Twentieth and Twenty-first. Two-story frame.
O.—B. Phillips.
C.—F. E. Dunbar.
$3,000.

McAllister, bet. Webster and Buchanan. Three-story frame.
O.—L. Leiser.
A.—H. Geilfuss.
C.—A. H. Plummer.
$7,500.

N

Ninth, nr. Market. Three-story frame.
O.—J. S. & C. F. Doe.
A.—J. J. and T. D. Newsom.
C.—T. H. Day.
Cost included in the job cor. Market and Ninth, same owners.

Natoma, cor. Russ. Alteration.
O.—John Devenny.
A.—McDougall & Son.
C.—J. H. McKay.
$3,000.

O

Oak, nr. Steiner. Two-story frame.
O.—Chas. Sawyer.
A.—J. H. Humphreys.
C.—C. L. B. F. Jones & Co.
$2,500.

Oak, bet. Webster and Fillmore. Two-story frame.
O.—W. F. Laughlin.
A.—P. R. Schmidt.
C.—Hugh Keenan.
$3,900.

Octavia, cor. Ivy Avenue. Two-story frame.
O.—Jane McLaughlin.
A.—Miller & Armitage.
C.—R. Parker.
$4,650.

P

Page, bet. Devisadero and Broderick. One-story cottage.
O.—E. Mutelstadt.
A.—H. Geilfuss.
C.—O. R. Chandler.
$3,000.

Pine, cor. Pierce. Two and one-half story frame.
O.—M. Sabin.
A.—W. F. Smith.
C.—F. W. Kern.
$7,500.

Post, bet Pierce and Scott. Two-story frame.
O. and B.—J. C. Wier.
Day work.
$4,000.

Post, bet. Kearny and Grant Avenue. Alterations.
O.—Kohlberg, Strauss & Frohman.
A.—Chas. I. Havens.
C.—P. Griffin.
$1,500.

Pine, nr. Lyon. One-story frame.
O.—A. Houschildt.
A.—H. Geilfuss.
C.—J. McKay.
$2,700.

Polk, cor. Bush. Additional contracts.
O.—Captain Taylor.
A.—W. Mooser.
C.—C. B. Gonyeau.
$5 000.

Pacific, cor. Leavenworth. Two-story frame.
O.—J. B. Hobson.
A.—J. J. & T. D. Newsom.
Carpenter work—Wessinger & Ponge, $8,825
Brick work—Geo. D Nagel. 1,725
Patent pavements—California Stone Co 500
Cost, $11,050

Post, cor. Hyde. Three-story frame.
O.—C. Weller.
A.—J. Marquis.
C.—V. Bergman.
$12,000.

S

Sutter, cor. Baker. Two-story frame.
O.—Mrs. Eugene Young.
C.—G. G. Gillespie.
$4,000.

Stuart, nr. Market. Two-story frame.
O.—Renton, Holmes & Co.
Day work.
$2,000.

Sutter, bt. Broderick. Additions.
O.—F. McCormack.
C.—R. Discher.
$1,600.

Sixteenth, north side, bet. Guerrero and Dolores. Two two-story frame stores and dwellings.
O.—Wm. McDowell.
A.—Charles I. Havens.
C.—A. Klahn.
$4,500.

T

Twelfth, cor. Glenn Park Avenue. Additions.
O.—C. J. Dempster.
A.—Huerne & Everett.
Day work.
$1,500.

Taylor, bet. Turk and Eddy. Four-story brick.
O.—P. Dupray.
C.—John W. Wessinger.
$17,000.

Twentieth, bet. Guerrero and Dolores. One-story frame.
O.—P. Gadina.
A.—M. J. Welsh.
C.—Joseph Dutton.
$2,500.

Twenty second, cor. Fair Oak. Two two-story frames.
O.—Mrs. A. H. Flagg.
A.—M. J. Welsh.
C.—Cormack & Elan.
$1,600.

Turk, bet. Taylor and Jones. Three-story frame.
A.—H. W. Burckes.
C.—Geo. W. Hansbrough.
$7,000.

Twelfth, bet. Mission and Howard. Frame church.
O.—Trustees Church of Christ.
A.—McDougall & Son.
C.—Ingerson & Gora.
$8,500.

U

Union, nr. Larkin. Two-story frame.
O.—Mrs. Brooks.
C.—Martin & Maguire.
$3,500.

V

Vallejo, nr. Van Ness. Two-story frame.
O.—Captain Barber.
A.—W. G. Hoagland.
C.—J. A. Benham.
$3,500.

Valencia, bet. Twenty-second and Twenty-third. Additions.
O.—F. Haake.
C.—C. H. Muresky.
$4,000.

Valencia, nr. Ridley. Two-story frame barn.
O.—R. Tobin.
A.—T. J. Welsh.
C.—P. J. Smith.
$1,500.

Vallejo, cor. Hodges Alley. Two story frame.
O.—J. J. Boyle.
A.—T. J. Welsh.
C.—G. T. Knupf.
$3,700.

Valencia, cor. Ridley. Three-story frame.
O.—John Fisher.
C.—John L. Binet.
$8,000.

Van Ness, cor. Ellis. Alterations.
O.—D. Hunter.
A.—H. T. Bestor.
Day work.
$10,000.

W

Webster, cor. Pacific. Two two-story frames.
O.—
C.—J. P. Sheppard.
$7,000.

Washington, nr. Stockton. Additions.
O.—Mrs. Pauline Mitchler.
C.—W. T. Veitch.
$4,500.

Washington, cor. Octavia. Two and one-half story and basement frame.
O.—Alex. Boyed.
A.—Curlett & Cuthbertson.
C.—Peter Crichton, $18,790
Brick work, 2,000
Total, $20,790

Welch, bet. Fourth and Fifth. Two-story frame.
O.—Mrs. M. Sand.
A.—T. J. Welsh.
C.—Doyle & Son.
$3,000.

MISCELLANEOUS.

Alameda—Two-story frame. O., W. T. Ryer; A., Geo. A. Bordwell; C., Ingerson & Gore; $4,500.

HILL'S PATENT INSIDE SLIDING WINDOW BLINDS

Are Adapted to Any Style of Window

And Suitable for all Buildings, Dwellings, Stores, Office Buildings, and for Houses Built to Rent, Hotels, Boarding or Lodging-Houses are Unexcelled.

THEY are entirely inside of the window casing, and while requiring no furring out or boxing, make it an impossibility to tear curtains, interfere with plants or window ornaments, or become broken by contact with chairs or other movable articles.

The light can be admitted and sunlight excluded from any part of the window; can be instantly removed and taken to any part of the house to clean, and as easily replaced.

They can be opened or closed with the window raised, and without removing articles from the window-sill, and cannot blow open or rattle. The Blind is very light (one-half inch in thickness) and strong, possessing more durable qualities than a hinged blind one inch in thickness.

There is NO SAGGING, BANGING, OR GETTING OUT OF ORDER!

They are made in three sections in height (each section sliding past the others), and any number of divisions in width corresponding to the folds in the old-fashioned folding blinds. They require NO HINGES—all trimmings furnished with blinds—are MADE OF ALL WOODS, finished or unfinished, and COST LESS than old-style folding blinds. They have been extensively used by the best architects and builders throughout the East and West, and have given perfect and entire satisfaction wherever introduced.

ENGLISH AND AMERICAN VENETIAN BLINDS (IMPROVED).

The only perfect Venetian Blind in the market. The Blinds can be seen at the Mechanics' Fair. Or for samples, prices, and further information, address

EDWARD B. HINDES, Office 330 Pine St., Room 55, S. F., Cal., Manufacturer for California, except Counties of Los Angeles, San Diego, Kern, San Bernardino, and San Luis Obispo.

Or, W. S. HOLLAND, Pasadena, Cal., Manufacturer and owner of P. C. Territory. Rights to manufacture, and territory for sale.

The following are a few of the owners who have adopted the HILL BLIND in preference to any other:—

L. M. Fabry, c r. Hayes and Laguna; architects, Miller & Armitage. John MacKenzie, cor. Grove and Broderick; architect, H. D. Mitchel. H. F. Bruns, cor. Geary and Taylor; architect, John M. Curtis. Sutter and Hyde; architects, Pissis & Moore. A. M. Starr, Washington nr. Fillmore; architects, S. & J. C. Newsom. J. H. McKay, cor. Washington and Steiner; architect, J. H. McKay. U. S. Government, Presidio Reservation; architect, J. H. Humphreys. Baron Von Schroder, 553 Harrison; architect, T. J. Welsh. G. G. Burnett, Larkin nr. Turk; architect, James E. Wolfe. A. F. Le Jeal, Clay bet. Franklin and Gough; architect, H. C. Macy. J. C. Weir, Post nr. Scott (second order); architect, J. C. Weir. P. Dupuy, Taylor nr. Turk; architect, W. H. Bayless. J. S. Morgan, Mission bet. Twenty-fifth and Twenty-sixth; architect, C. V. Pierce. N. W. Cole, Mission nr. Twenty-fifth; architects, S. & J. C. Newsom. John Ritchie, Woodland; architect, W. H. Carson. Court House, Petaluma; architects, S. & J. C. Newsom. L. H. Sweeney, San Rafael; architects, Pissis & Moore. Court House, Santa Rosa; architects, S. & J. C. Newsom. Raymond Hotel, Pasadena; architect, J. H. Littlefield.

THE CALIFORNIA ARCHITECT AND BUILDING NEWS.

VOLUME VII. ENTERED AT POST-OFFICE, SAN FRANCISCO, AS SECOND-CLASS MAIL MATTER. ESTABLISHED JANUARY, 1879. NUMBER 10.

THE

California Architect & Building News.

A MONTHLY JOURNAL,

Devoted to Architecture, Decorating, and Furnishing.

PRICE, $2.00 PER ANNUM.

The official organ of the Pacific Coast Association of Architects. Published by the SAN FRANCISCO ARCHITECTURAL PUBLISHING CO. No. 240 MONTGOMERY STREET, Rooms 11, 12, 13.

Subscribers will please notify us promptly of any failure to receive this journal, and also of any change in their address.

Advertisements inserted at reasonable rates.

SAN FRANCISCO, CAL., OCTOBER 15, 1886.

THE OFFERED SALE OF THIS JOURNAL.

SINCE the first announcement in its pages that the entire interests of this journal would be disposed of to competent parties, a great many personal inquiries have been made, and propositions submitted and declined.

A sale contingent upon certain stipulations might have been made three months ago, but as we propose an unconditional surrender of the situation, we shall hold the fort until a competent commander-in-chief shall arrive, with satisfactory financial credentials.

Negotiations now pending with parties and firms east of the Rocky Mountains, may result in a full change of management by the first of January next, if not sooner. In the meantime the journal will be continued as heretofore to the best of our over-burdened abilities.

A GENERAL EXPLANATION.

Those who have made inquiry by letter, and personally, have asked for all the facts of the case, and what will be included in the sale.

As a general answer, we state: A sale will include every interest of the publication—its good-will, subscription list and advertising patronage, office appointments, desk, bound volumes and back numbers since 1879, outstanding accounts due from all sources, five hundred copies, more or less, architectural, mechanical, and other publications (optional), and all else pertaining to the publication and circulation of the journal.

We state, in answer to the question repeatedly asked by correspondents, in reference to

COMPOSING ROOM AND PRESSES,

That there are none. The journal has been conducted incidentally in connection with our architectural pursuits, and printed and bound ready for distribution by contract.

But with these limited facilities and restricted advantages, and personal attention divided between two great interests—editor and manager, and practicing architect—each demanding our whole time and energies, we have continued our publication work for eight years (less two months) with a profit to ourselves, making a most enviable reputation for the journal, as evidenced by the hundreds of complimentary notes from time to time published by technical, class, and other journals, and preparing the way for some one to continue its publication with great success and profit.

We Want YOU, Who Have Not, To PAY UP.

ANTICIPATING retirement from the management of this journal, those who have *not paid up* their subscription dues will confer a favor by *doing so at once*. Let there be no delay in this matter. We propose to clean up as neatly and nicely as the good pleasure of *honestly disposed* patrons may make possible, and as thoroughly—☞ *as the law provides* ☜—with those who refuse or neglect to settle their accounts.

Every unpaid dollar due us has been faithfully earned by unceasing desires and earnest efforts to found and perpetuate a California class journal in the interests represented in these columns; and measured by the mental and physical cares and labors, and the financial requirements to this end, every dollar yet due us has been honestly earned and should be paid promptly.

We hope not to be required in any case to invoke legal redress, but as protection of publication interests, which have been and are so often abused by that portion of the reading public who seek to obtain their reading matter without cost, the law in such cases made and provided is, that every man who *receives* a subscription journal of any sort, can be held and made to pay the full amount of subscription, up to the time of *payment* and stoppage.

Summary of Building Activities.

THE number of engagements and the cost of same for month of October, as compared with same month of 1885, may be seen below:—

157	engagements for 1885	Cost,	$579,114
54	" " 1886	"	230,720
103	" in favor of 1885	"	$348,394

Antiquity of the Hot-Air Furnace.

THE younger Pliny, writing to one of his friends about one of his country seats, mentions among other things that next to the smaller drawing-room there is a semi-circular room with windows arranged so as to get the light of the sun all day. He says: "Out of this is a bedroom which can be warmed with hot air." He also refers to the "bath with its cooling room and its hot room." As Pliny, Jr., lived A. D. 62–116, we may assume that hot-air furnaces are no new thing.

Pointers for Advertisers.

DON'T expect an advertisement to bear fruit in one night. You can't eat enough in a week to last you a year, and you can't advertise on that plan either.

People who advertise only once in three months, forget that most folks cannot remember anything longer than seven days.

If you can arouse curiosity by an advertisement, it is a great point gained. The fair sex doesn't hold all the curiosity in the world.

Quitting advertising in dull times is like tearing out a dam because the water is low.

IT would require 50,000,000 pounds of wire to erect a telegraph around the earth at the equator, and but a half pound of the thread made by a certain species of spider.

How to Pay a Compliment.

TO pay a high compliment is to tell the truth, and to tell it as though you mean it. And the only way to do that is to mean it. If a girl is pretty or accomplished, if she plays well, or sings well, or dances well, or talks well; in a word, if she pleases, why in the name of common sense shouldn't she be told of it? Don't blurt it out before everybody. That will only make her feel uncomfortable, and make you appear ridiculous. Say it quietly when opportunity offers, but say it strongly. Convey the idea distinctly and fully, so that there may be no mistake about it. But don't do it "officially." Formality is about the coldest thing known. More than one maiden has been made happy—say for half an hour—by a man's taking the trouble to say a pleasant thing about a toilet that he liked, and many of fashion's follies have been given up by girls when they noticed a discreet silence concerning them on the part of their gentlemen friends. A bewitching little black-eyed beauty once said to a gentleman: "I like to have you say sweet things to me, it seems to come so easy and natural." In general terms, it may be said that it is always better to say an agreeable thing than a disagreeable one; better for all parties. The gallant who, when a young lady stepped on his foot while dancing, and asked pardon, said, "Don't mention it; a dainty little foot like that wouldn't hurt a daisy," not only told the truth, but doubtless felt more comfortable than the boor who, when his foot was stepped on, roared out, "That's right; climb all over me with your great clumsy hoofs."

Fire Hose and Garden Hose, W. T. Y. Schenck, 256 Market Street.

Quarrying Large Stones.

THE Greeks had a predilection for large blocks of marble or stone, and their method of quarrying is interesting even to-day. They were extracted in the following manner:—

In order to procure the square stones—after the top and front faces of a given mass of the rock in the quarry have been brought to a plain surface—incisions, usually from 4 to 5 inches wide, were made on the top surface, marking out the boundaries of the intended size of the block. These incisions being continued down to the desired depth of the block, there remained nothing more to be done than to separate it from its lower bed, which operation was performed, as there is every reason to think, by the expansion of wooden wedges saturated with water. The cylindrical courses for the shafts of the columns were extracted (as may be observed at the quarries of Selinus, in Sicily) by means of a circular passage-way, 2 feet 8 inches in width, being hewn out of the rock and taking the entasis of the intended column, thus leaving an isolated mass of stone in the center the exact shape and size of the required shaft. I should here add that the stone columns of every temple occupy almost invariably the same relative position in the building which they occupied in the quarry.

This circular mass of stone has now, like the square blocks, only to be lifted from its lower bed; and the method employed, which, from the examinations of the quarries at Selinus, can be no longer doubted, bears me out in a conjecture I had previously made on the square blocks. A hole, or deep incision, wedge-shaped, was made in the lowest part of the insulated cylinder, in the direction of its center, but considerably to one side, reasons for which will be obvious. Into this hole, I presume, a wooden wedge was inserted, which was saturated with water, and which, being suffered to expand while in this position, would, at no great distance of time, heave up the mass, on the same principle applied to the splitting of slate and mill-stones in France, and so separate it in the direction of its bed. Nothing, I think, appears more likely, from the consideration of the facts observed at Selinus, than that such was the method employed; and since I see from my memoranda that I observed the branch of a shrub not one inch in diameter, which by its growth in a crevice of a rock had split a mass of stone weighing about 50 tons, I can readily conceive that the small orifice with its wooden wedge would have been sufficient to loosen the required mass.

In our December issue we will publish complete a list of those who are in arrears for subscriptions to this journal. Avoid publicity by sending us the amount of your indebtedness immediately.

Fire Hose and Garden Hose, W. T. Y. Schenck, 256 Market Street.

In our December issue we will publish complete a list of those who are in arrears for subscriptions to this Journal. Avoid publicity by sending us the amount of your indebtedness immediately.

Loafing.

WHILE there are many complaints made, from time to time, says the *Mechanical News*, about the dullness of business and the hardness of the workingman's lot, we hazard the statement that about one-half of the hard times and business depression is the direct or indirect result of loafing—either good, or solid, square, old-fashioned, primitive loafing, or the modern revised version, which is called, for some occult reason or other, "soldiering."

There are very few honest, safe, and profitable occupations in which success can be attained by sitting down and waiting for it, or is got by luck. There is more gold got out by patient labor than was ever brought to light by stubbing the toe against nuggets. The diamond fields are the scene of patient, plodding labor, neglecting no shovelful of dirt.

There is a marked difference between workmen who are doing for themselves, or who are piece-working, as well as among those who are "by time." One man will loaf away an hour a day. It may be listening to, or watching his neighbor; or hunting a match or helping hunt one; or wondering what to do next; or it may be distributed all through the day by deliberate and careful attention to the science of slow moving as applied to the prevention of heat or rupture; but it is there, all the same; there is an unproductive hour, or a day with a tenth or an eighth less work in it than it should have.

A day's workman cannot afford to loaf. He may lose his place, for a selfish reason. He is not giving an honest equivalent for what he receives, for a moral one. He is getting into the habit of working slowly, which will interfere with his profits if he gets on piecework—selfish reason No. 2. He is setting a bad example to others to render a poor equivalent for their pay—moral reason No. 2.

We could keep on piling up reasons of each kind against loafing, but they will suggest themselves; and then the case is somewhat analogous to the one where the lawyer announced twenty-nine reasons why his client did not appear at the trial. In the first place, he was dead. The second reason was that "the first reason was reason enough."

There are many foundries and factories, mills and shops, where no smoke issues from the stack and no rumble of work is in the air, and in which more energy and less loafing, on the part of proprietors and employés, would have enabled work to continue right along, at least at a rate which would pay hands and keep the business in public mind until times were better. Ten per cent more work out of every man would not have strained any one, and would have made just the difference between a slight loss in the business, and "expenses cleared." And that ten per cent more work would have improved every man on the place.

We just heard an anecdote of a noted stenographer who drops into profanity if a day goes by without his having anything to do; not because he loses the earnings of that day, but because he loses speed. He gets some one to read fast to him, in order to keep up his speed.

Go into an engine room and see the engineer doing nothing all day, and you will see a man who will not earn any more ten years from now than he is now getting. Instead of loafing, he might be reading, or drawing his engine out to scale, or learning something about the machinery his engine drives.

The time for loafing is after work. Then it should be free and unreserved, and will be beneficial and rightly earned.

Method of Obtaining Length of Rafters.

FOR some months past there has been quite a discussion of various plans for obtaining the length of rafters. Many of the methods presented are not desirable, for the want of accuracy. Some years ago the subject came up for discussion where I was at work, and I then prepared the following table, which is very simple and mathematically correct. Any mechanic can copy it on the back of a business card and tack it to the lid of his tool-chest, where it will always be handy for reference. The word "pitch" means such a fractional part of the width of the building. The further north you go the steeper the pitch, on account of the snow; also certain localities have pitches peculiar to that section of the country.

Pitch.	Square.	Rafter.	Brace.
1-6	4 and 12	0.527046	1.054092
5-24	5 and 12	0.541666⅔	1.083333
1-4	6 and 12	0.559017	1.118034
7-24	7 and 12	0.578852	1.157704
1-3	8 and 12	0.600925	1.201850
3-8	9 and 12	0.625	1.25
5-12	10 and 12	0.6508541	1.3017082
11-24	11 and 12	0.6782843	1.3565686
1-2	12 and 12	0.7071068	1.4142136

The first column indicates the pitch of the roof; the second gives the figures on the square that will cut the various pitches; the third gives the length of a rafter for a building one foot wide, and the fourth gives the length of braces for runs of the same proportion as the figures in the second column.

The manner of using the table is as follows: For any given pitch multiply the tabular number by the whole width of the building, and the product will be the length of the rafter in feet and decimals of a foot.

Example.—What is the length of a rafter of a building 18 feet wide at ⅓ pitch?

Solution.—0.600925 × 18 = 10.81665 feet, or 10 feet 9 13-16 inches.

Example.—What is the length of a brace having 40x48 inch run?

Solution.—40x48 inches is the same proportion as 10x12; hence, 1.3017082 × 48 = 62.482 inches, or 62½ inches, always using the longest run for multiplier.

Example.—What is the length of a brace having 35x35 inch run?

Solution.—1.4142136 × 35 = 47.4974 inches, or 49½ inches.

"EDITOR ARCHITECT:—Please settle a difference of opinion by stating the proportion between the load a given floor will bear when the joists are not bridged, and the same floor thoroughly bridged, with two rows of herring-bone bridging."

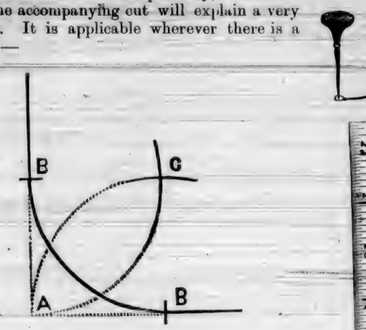
A floor will not bear any more weight by being bridged. The advantage to be gained by bridging lies in the fact that an individual joist is strengthened thereby, thus increasing its power to resist a concentrated load upon it, such as a heavy book-case, safe, etc.

A "YOUNG mechanic" wants us to inform him how to tell whether butts are for left or right-hand doors.

Lay the butts on the bench or table with the knuckle-joint towards the right hand. If they are open at the top they are right hand; if open at the bottom, they are left hand. A door that opens away from you to the right, is called a right-hand door. If it opens away from you to the left, it is called a left-hand door.

"EDITOR CALIFORNIA ARCHITECT: I often have occasion to *round off the corners* in various branches of my work, and what I require is a rule by which I can do so, and have the curvature perfect. Will you kindly furnish me the information, as others besides myself would no doubt be benefited. Respectfully, AJAX."

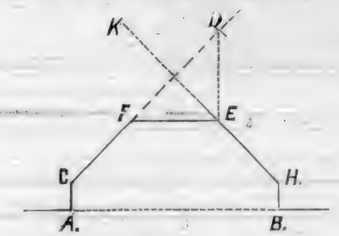
ANS.—The accompanying cut will explain a very simple way. It is applicable wherever there is a right angle:—



Let B A, A B represent the square corner of a shelf, or any object. Suppose the radius of the curved corner to be 1 inch. From A, as a center, mark off 1 inch each way, as at B B. With B B as centers, and radius A B, describe the circle A C. The point of intersection, C, will be the center of the arc B B.

"BUSINESS MAN. OF ARCHITECT: Is there a quicker method of finding the length of the sides of a bay-window, drawn on paper, than the old way of spanning around with a pair of compasses, till you get the three sides equal? READER."

ANS.—The cut will explain a very *neat way*.



Extend C F or E H; lay off on the line C D a distance equal to the width of your window, as A B. At D drop a perpendicular, and at the point where it intersects E H, as at E, draw E F, parallel with A B.

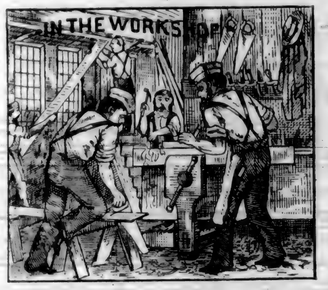
A CARPENTER wants to know how to remove the stains in his apron, caused by wet nails. For his information we will state: Soak the stains in a weak solution of chloride of zinc, and rinse immediately in water.

DO NOTHING in building by guess-work, and in its conduct trust not too much to memory, for a jotting or, too at the proper time are worth a hundred jogs on the brain, for the purpose of safe recollection.

IF you would set out good work, do it by practical geometry; if indifferent or bad, by the "rule of thumb."

A FAIR day's work for a fair day's wages should be estimated by its quality as well as its quantity.

THOUGH a strong man, the carpenter cannot raise his frame without assistance.



We will be pleased to receive for publication in this column items of information in regard to practical ideas connected with the mechanical part of the building trade. We especially invite suggestions from apprentices and young mechanics.

Business Manager of Architect: In putting on a moulding around a circular head of a window, it is necessary, of course, to kerf the moulding in order that it may bend without breaking. Is there any rule by which we may know just how much solid wood to leave between each kerf?

Ans.—There are many solutions to this problem, but for simplicity and exactness, the following rule is better than any other which we can at present call to memory:—

Let A B C be a curve to which a moulding or other work is to be bent. Supposing the stuff to be one inch thick, take a strip equal to this, and run a gauge line on to the thickness of a veneer; then make a cut down to veneer. This done, lay a strip on the drawing, keeping the cut opposite S, the center of the given curve. Fasten the lower part of strip; its face is now on line S P. Move it to the left until cut at S closes, which causes its face to be on line S T, and gives for solid wood between each kerf 2 3. Here it must be kept in mind that the same saw with which the cut was made in strip must be used for kerfing the work.

Some materialistic scientists are very fond of quoting the remark of Kant: "Give me matter, and I will explain the formation of a world;" but they omit the other words, "Give me matter only, and I cannot explain the formation of a caterpillar."

Wall supports for clothing: When you drive a nail into a wall, clothes press, or closet, to hang things on, drive it through a spool up to the head. Select a spool with a hole large enough so that the nail will not split it.

California Architect: I have a post, the lower half of which is to be square. The upper half is to be octagon shape, so that the angles of the octagon shall be in the middle of each side of the square. Will you please illustrate a simple method by which I can draw the octagon?

Ans.—Let A B C D be the square. Draw the diagonals A D and C B and the center lines *e f* and *g h*. From the center *i*, with a distance equal to half the width of the square, as *i h*, mark on the diagonals the points *k l m n*. Join *e k*, *k g*, *g l*, etc., and you have the figure required.

The following tables will be found of much benefit to parties residing in the country, who desire to know the weight of doors, sashes, blinds, etc., so as to form a basis for railroad expenses:—

WEIGHTS OF DOORS.

	1 Inch.	1¼ Inch.	1½ Inch.
2 ft. 0 in. x 6 ft. 0 in.	20 lbs.	25 lbs.	32 lbs.
2 " 6 " x 6 " 6 "	27 "	33 "	38 "
2 " 8 " x 6 " 8 "		35 "	40 "
2 " 10 " x 6 " 10 "			48 "
3 " 0 " x 7 " 0 "			50 "

WEIGHTS OF WINDOWS.

	1¾ Inch.	Glazed.	Unglazed.

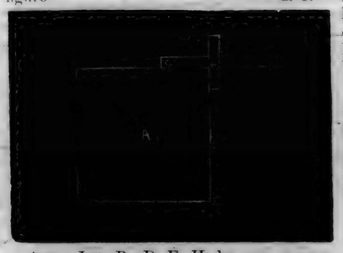
Pickets, per 100 ft. of lumber contained	200

Business Manager of Architect: Will you please illustrate a method for setting a gauge for an octagon without drawing the figure B. Y.



Ans.—Let B D E H be any square. From B with the radius A B, draw A C. Set the gauge to equal C H.

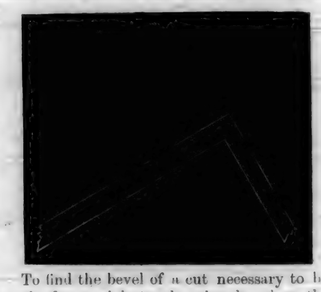
Mechanical Editor of Architect: I send you a method I have used for some time, to get the bevel cuts for *splayed* work, or work having sides equally inclined or *flared*, the base of the work being a right angle.

Draw two parallel lines, any distance apart, as A B, C D. Let 2 A be the given *flare;* from A, square down a line cutting in C; take 2 as a center, and A radius, strike the arc cutting the perpendicular from 2 in F; join C F. This gives bevel P for direction of cut on face of stuff.

To find a bevel for miter on the edge:—

Take 2 as center; strike an arc, touching line A B and cutting at D; join D F. This gives bevel R for miter on edge of stuff, which should be square for application of bevel.

I do not claim the above at all as original. It is simply the way I learned in the East, and put in practice on my work in California.



To find the bevel of a cut necessary to be made for a right angle triangle, place the blade of the square on 7, and the tongue on 4. The bevel to use is the one formed by the blade or long arm of the square.

Any multiple of the above-mentioned figures may be used, as 3½ to 2, 14 to 8, etc. Take three pieces of scantling or other lumber, apply the square as per rule, cutting all three pieces of equal length and with the same miter; by putting the pieces together a perfect equilateral triangle will be formed.

In planning stairs, think of your headroom from the lowest starting-point to the highest landing, or somewhere in ascending or descending stunning falls and broken limbs may accompany bruised foreheads and battered hats.

Perspective is necessary in drawings, but do not carry its principles into practice in putting together workmanship.

Houses may not be built from the roof downwards, though they are often burned in that direction by plumbers' fires.

In making out building quantities do not overrate them too much, for you may calculate too liberally for your own good, as well as estimate by guess-work too lowly to your own and others' loss.

ASKED, ANSWERED, AND COMMUNICATED.

☞ Architects, Contractors, Carpenters, and Mechanics generally are respectfully requested to furnish us items of interest for this column. We will gladly answer any and all questions pertaining to the architectural and building interests. If illustrations are necessary to explain your ideas, send us a sketch of them and we will make the cuts.

Free to All.

The columns of this journal are open to all who differ with us upon any subject presented. We are too old in years and experience to assume that we have passed the reef of human liability to err, or for one moment to suppose that we have reached the realms of thought where perfection reigns supreme. But this we do assure—that whatever of error there may be contained in our columns will be speedily corrected as soon as attention is directed thereto, and we are convinced of the error. We will give place to a reply in any case, when a mistake or wrong statement has occurred. It is our desire and purpose to be fair, just, and correct in all things, and do no person or subject any violence. We therefore invite free discussion and criticism, and again state that the columns of this journal are at the service of all who desire to differ with us upon any theory or subject, or who take exception to anything at any time appearing in our columns.

San Francisco, Sept 30, 1886.

Editor Architect: Will you please answer the following questions in your columns: From which part of the redwood tree do the bird's-eye and curled burls which are used for veneering work, etc., come? Are there only a limited number of trees containing such burls? Is there any difference in the quality of redwood lumber growing in the different parts of the State? and does the redwood grow in the Sierra Nevada Mountains? Th. Weinert.

Answer.—Bird's-eye and curled burls are obtained from the lower part of the tree. In fact, many stumps have been dug out and sawn up for the sole purpose of obtaining the above varieties, the upper or lumber portion having, in many cases, been used long ago. Only a limited number of trees contain bird's-eye specimens. The different kinds of redwood are generally known as hard and soft, according to the part of the tree from which it is obtained. Redwood does not grow in the Sierra Nevada Mountains, except in very isolated instances. Its growth is confined to the vicinity of the ocean; in fact, a foggy condition of the atmosphere seems essential to its mature growth.

To construct a scale by which the side of any octagon is known at once.

Take any right angle, as A B F. From B, with any radius, draw the quadrant A D; divide it at C; with C as a center and with any radius, make an arc at O; with same radius and center D intersect the arc; through the point of intersection draw B K, and the scale is complete.

To prove the scale, make the distance B F equal A D, figure 5; square up from E, cutting at H; then F K equals 2 L, the side of the octagon.

The above is an exceedingly neat and easy way to get the side of an octagon without drawing the whole figure.

Editor Architect: As you have extended invitations several times to mechanics, asking them for communications in regard to improved methods of finding the length of rafters, I beg leave to submit to your approval the following method used by me in the Western States. Many of the mechanics in that section practice the rules given in all their roof work. While not giving the length with that same degree of exactness that would be found by the rule for finding the hypotenuse, two sides being given, still it is so near exact that the difference cannot be noticed, and I am sure it is a far quicker method than that old way.

I do not think that any simpler method can be given for finding the bevels at the heel and point of rafters than that explained in the issue of your journal referred to, so in this article I will deal with the length alone.

The most common width of buildings in California is 24 feet. And I propose to take that width for the practical test of my proposition. As you have given several ways by which the same result can be obtained, I will take up each of them and compare with mine.

Finding the length of the hypotenuse by the old rule, we obtain for a one-quarter pitch 13 : 4.99, or, as near as it can be used on the square 13 feet 5 inches.

Allowing one inch to the foot and trying your second method, we find, as the result, 13 inches and 7-16 scant, or 13 feet 5 inches. This is a very simple method, and when the rule is kept perfectly straight, the results are very satisfactory.

By my way I simply multiply the width of the building by the decimal .56, 24 × .56 = 13.44, or, as near as can be worked by the square, 13 feet 5 inches.

Let us try the same rule for a greater width—say 60 feet. By finding the hypotenuse we find as near as can be used by the square, 33 feet 6½ inches. By my method it would be 60 × .56, or 33.60, equal to 33 feet 7 inches full. By this method the rafters in wide buildings are a little long. Thus, if the building is 52 feet wide, by the hypotenuse it would be 29 feet 1 inch; my way it would be 29 feet 1½ inches. I consider this an advantage, as it leaves the point of the rafter very slightly open.

For a one-third I follow the same plan, only using the decimal .6. Unlike the decimal used for a quarter-pitch, the lengths obtained are a very small fraction short; as, for instance: a rafter for a building 60 feet wide, by finding the hypotenuse, would be 36 feet 1-16 of an inch. By my way, 60 × .6 = 36 feet. A slight difference, truly. If building is 48 feet wide, then by the first method we find 28 feet 10 inches full; by my way, 28 feet 9 3-8 inches. A little practice will enable the mechanic to allow just enough to make up for the slight difference, so that when rafters are put together the fit will be perfect.

The one-half pitch can be found in the same manner by using the decimal .71. Taking the 24-foot building, length of rafters by the hypotenuse we find 16 feet 11⅜ inches; my way they would be 17 feet full. Again, building 60 feet wide, rafters by the first method would be 42 feet 6⅛ inches; by my way 60 × .71 = 42 feet 6 inches. By using this decimal, the length is so near practically correct that it may be used in all cases.

For a full pitch use the decimal 1.12, and as in the preceding mentioned pitch, and it will be found so near correct that it can be practically used in all cases.

It will be noticed that I have not made any allowance for projection of rafters over the plate. In this case gauge from the crowning side of your rafter the thickness of your projection; allow enough for the latter, and find the lower bevel according to the way you described in your last; measure the length of your rafter from where this bevel crosses the gauge line.

A little practice will enable the mechanic to lay off a rafter in a very short time. I have used the above myself, and have no trouble whatever. If any of your readers will work out the lengths of rafters according to their own methods, and can show that the one I use has any defects, I will be pleased to hear from them through the columns of your journal. Trusting that the above will so meet with your appreciation that you will deem it worthy of your notice, I am, respectfully, your well-wisher.

W. Helianus.

E. M. H. writes: "I have been working on buildings where the head carpenter, with a ten-foot pole, a pencil, and a square, will lay out the pattern for the rafters in less time than it takes me to write this. Upon asking for information how to do the same thing, I was told to study up the matter as he had done. Please give me a more practical answer."

Although not a very polite answer to receive from a fellow-workman, it is directly to the point. If E. M. H. will invest a few dollars in practical works on the "Steel Square and Its Uses," etc., he will, with a little study, lay out rafters as easily as the "head carpenter." Of course, in laying out a rafter, the first thing to find out is the pitch, or rise, of the roof. A quarter-pitch is one where the peak of the roof is one-quarter the width of the building higher than the plate; one-third pitch, peak one-third higher, etc. Or, in other words, a one-quarter pitch has a six-inch rise in each foot of width; a third pitch has an eight-inch rise in each foot, etc.

Pick out a straight piece of timber for a pattern. For a quarter-pitch, place the square against the straightest edge, with the tongue on 6 and the blade on 12. The bevel of the blade will be the bevel of the heel of the rafter, or the part resting on the plate. The bevel of the tongue will be the bevel of the point of the rafter.

Proceed in the same way with any given rise to the foot. For 5-inch rise to the foot, use 5 and 12 on the square; for 7-inch rise to the foot, use 7 and 12; and so on. The length of the rafter may be obtained in several different ways. Suppose the building is 36 feet in width, roof one-quarter pitch. On the square lay your rule so that the point will be at 18 on the blade, or one-half the width of the building, allowing one inch to the foot, and let the rule cross the tongue at the figure 9, which represents the rise of the roof, or one-quarter pitch. We find by looking at the rule the distance is 20⅛ inches, or 1 inch to the foot—20 feet 1½ inches. For a third pitch, let the rule cross at 12 instead of 9, and we have the length 21 feet 7½ inches.

Use a smaller scale for buildings that have a greater width than 48 feet. For those who understand the extracting of the square root, that plan enables them in a very short time to get the precise length of the rafter.

In the way just described, no allowance has been made for projections of rafters over the plate. It is obvious that a little different application of the principle will have to be applied if the rafter has a projection of one, two, or three feet.

Octavius Morgan.

THE subject of our sketch is a gentleman well-known in the Southern part of this State. A stranger upon his arrival in Los Angeles, he has, by his own individual energy, raised himself to a standard to be envied. He began his career as an architect in the beautiful "City of the Angels" in connection with Mr. Kysor. Since the formation of the partnership, the firm has had charge of a great many of the more principal buildings, both in Los Angeles and the surrounding country, some of their artistic plans ranking with those of any architect in the State. Mr. Morgan is a member of the San Francisco Chapter, American Institute of Architects.

Octavius Morgan.

"By Day's Labor."

THERE is perhaps a less comparative proportion of work done "by the day" in San Francisco than in any other city. The "day's-work jobs" are limited in number, and only in exceptional cases are they of any considerable extent or cost. The reasons why this state of things exists are numerous, and their recital in elucidation of the many facts involved would fill hundreds of pages of this journal. There are two sides to the main question, each prolific in argument, tending to illustrate that selfishness, avarice, cupidity, covetousness, and their kindred inspirations, control the acts of men in innumerable instances.

The more fatally forcible argument is against the operating classes, who apparently fail to comprehend or realize the error so often committed on their part, in seeking to protract and make the most of work intrusted to them under the day's-work system, either by excessive charges for material furnished, or tardiness, amounting to what is understood by the term "loafing," *i. e.*, killing time, and idling away the time, so as to prolong the work in hand and extend its duration.

The *mischievous* fact of the matter, as far as the working classes are concerned, is in the creation of a general sentiment and belief that workingmen cannot be trusted—that work done by the day costs very much more than a right and proper price, and excessively more than if done by contract. Consequently, this conclusion has become general, if not universal, that safety from excessive charges and wasteful cost in the execution of all classes of work can only be secured under contract arrangements.

This state of things induces a feeling of distrust, and creates antagonism between employers and employes, often amounting to "real ugliness." Tricks and deceptions are imagined on the one hand, even where not in practice; and, on the other hand, resorted to in fact in many cases, because the underlying principles are defective. The attempt to use advantages wrongfully often works to the disadvantage of those making the attempt, and operatives generally have lessened their opportunities and reputations by "piling on" too much; and, instead of being content with legitimate and fair profits, and working as steadily and faithfully on day's-work jobs as when restricted by contracts, have created prejudices against "day's work," and enforced the contract rule.

If the contract system was preferred for reasons alike honorable to all concerned, there could be no objection to its adoption; but, from the fact that it is more the outcome of irregularities practiced and suffered, than from necessity or preference, it amounts to a partial, if not conclusive, presumption, that under contract forms of operation certain protections are afforded to the paying party, which are not assured by the "day's-work" rule; and the fact that protection is sought, argues the existence of a wrong or evil, either real or imaginary, as *protection* is wholly unnecessary in the absence of danger; and this feeling or sentiment of distrust and fear of overcharges and excessive cost, influences many to adopt the contract system, who, if confident that they would be honestly and squarely dealt by, would prefer to have their work done under the "day's-work" regulation. This adverse sentiment to day's labor bears severely upon many good and honest men, who would exercise as great diligence and integrity in the execution of work by "the day" as though bound by contract obligations. There are many such, but the more general experience creates the rule by which such matters are judged; and, by this rule of judgment, the conclusion is almost universal that proper economies and fair dealing cannot be secured where work is permitted to be done without contract restraints and limits.

It is to be regretted that this conclusion is too well sustained by the practice of a considerable number, if not a majority, of those who have been intrusted in good faith with the execution of works of various kinds, upon the presumed integrity of the operating parties. Many—influenced by one, or either, or all the evil inspirations mentioned in the preceding portion of this article—overstep all bounds of consistency and fairness, and, frequently, for no other reason than manifest excess in charges, are compelled to modify their demands.

All this is greatly to be regretted, as it works to the disadvantage of the working classes, and justly so—only so far as right and honest principles and rules of trade are violated, and questionable methods adopted to draw from paying parties more than a true and right value for the work performed and materials used.

By the "stringing it out" and "piling on" process, men may sometimes secure large pay and profit for the time being, but every such occurrence works to the after disadvantage of the party who enjoys (!) such *temporary* profitable results; and, however much or little justified, as far as other men are concerned, those who suffer by wrong acts—it matters not by whom committed — naturally withhold confidence in others, and pre-judge the virtue of the masses, by the experiences encountered in one or more individual cases.

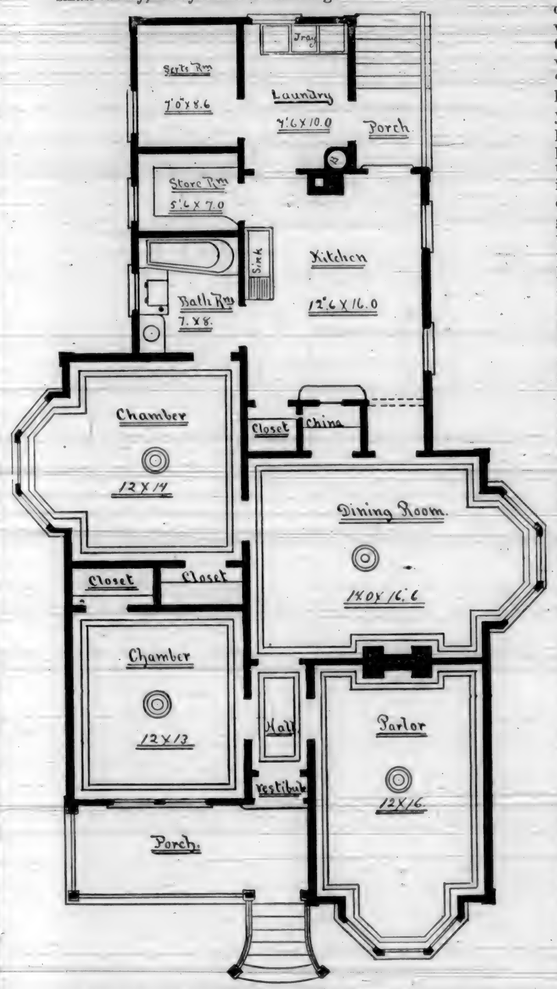
"Alas for the alum in the bread, and the chalk in the milk, and the powdered glass in the sugar, and the Venetian red in the cocoa, and the no-one-knows-what in the syrup. If a man not at all bigoted, but very liberal on the subject of temperance, and of the high-license persuasion, wants to imbibe some inspiration to help him fight down the fanaticism of prohibition, and he goes up to the counter and pays for an honest drink, he swallows and smacks his lips over coccolus indicus, and potash, and cochineal, and blue vitriol, and other delectables; some of these things put in to make the beverage hot, and some to make it red, and some to make it mix, and some to counteract the fatality of the others. Our officers of health have done a good work, but their chief work is yet to be accomplished. The ghastliness of diet to which millions of the American people are subjected may account for much of the sudden death and otherwise unaccountable and increasing suicide. It is amazing that there is any good sound health left for this systematized and almost universal poisoning process. Let us agitate the subject."

When you have the woodwork in a room painted, it is a good plan to have about two inches of the floor painted also; have the paint the same color as that of the base board; then if, when changing carpets, the carpet will not come close to the wall, the little space left will not be so unsightly.

A Convenient Plan for a Country or Suburban Home.

THE provision of a convenient dwelling for a family in the country, or the suburb of a city, is a matter of great importance, and, perhaps, no portion of an architect's practice has been so usefully bestowed as that which has been devoted to the study of a plan for the occupancy of those who have to calculate every item of housekeeping cost, and who, living by mechanical labor, have need of frugal employment of their means to bring up a family in comfort.

The plan presented is peculiarly adapted to those having a small family, and yet like to have a guest chamber when needed.



In case of friends who call to stop overnight, what more convenient than the front chamber shown? The whole front of the house is at the disposal of the guests for their quiet enjoyment, and no noise from the kitchen will mar their slumbers should they sleep till late from being overtired from a long ride.

The parlor is large and well lighted, and so is the dining-room. Bath-room is supplied with modern conveniences. Ample closet room is found wherever needed.

Should more room be desired, the laundry could be placed under the house and the existing space transformed, with but little alteration, into a bedroom. If *cost* is an item to be considered, the cornices designated in the four principal rooms, could be omitted.

As shown, the plan could be carried out at a cost ranging from $1,800 to $2,500, depending entirely on the finishes and the depth of the owner's pocket.

Does Good Plumbing Render a House Safe?

MANY vague ideas still prevail with laymen about what constitutes a safe system of "sanitary plumbing." It is, however, not too much to expect that architects, who are constantly arranging in their plans for the so-called "modern conveniences," should have at least a fair knowledge of the rudiments of modern plumbing. What, then, shall we say of an architect who can be guilty of such gross misrepresentations and misstatements as those which appeared recently under the heading, "The Danger of Sanitary Plumbing," in the correspondence columns of the New York *Evening Post*? Starting with the incorrect assertion that "experts disagree both in system and workmanship as to good or sanitary plumbing," this "architect" tries his best to alarm the public by stating that water (in traps) will not at any time prevent the steady flow of sewer gas, and that "sewer gas rises, expands, presses, constantly generates, and must have space," and broadly maintains that "so far as all appliances yet known to the plumbing trade under the head of sanitary plumbing, as back air or direct ventilation go, no absolutely safe plan has yet been devised by which water and waste can be introduced into any bedroom or adjoining closet and the health of its inmates be unimpaired." It seems almost superfluous at this day to say that the above contains gross exaggerations and only goes to prove that "Architect" is not sufficiently well posted on the subject, a fact which becomes more apparent by his description of a fine house, said by him to have been "the best plumbed house in New York," done by experts, and which he takes as an example to illustrate the danger of modern sanitary plumbing. In this house, he tells us, five basins and one bath were trapped by a single unventilated trap in the cellar, at a distance of about 60 feet from the fixtures. How "Architect" can make the untruthful assertion that the above house was plumbed by experts it is hard to understand. He has probably never heard of Board of Health Regulations, which, since 1881, require in this and other cities each wash-basin and other fixture in a house to have a separate ventilated trap placed immediately underneath the fixture.

"Architect" winds up by advising the householder to "strip his bedrooms of all plumbing whatever; to let no sewer connection of any kind come into a sleeping-room; to go back to the clean, old-fashioned bowl and pitcher, and to put all plumbing in an annex or separate building"—advice which, by the way, is not at all new, for years ago the late Dr. Frank H. Hamilton recommended the same thing. Thanks to the better understanding of the subject, such views are now considered to be old-fogyish and exaggerated.

Only last week we had occasion to make some remarks upon the uselessness of assertions, by well-meaning but ill-informed physicians, in regard to the unreliability, from a health point of view, of so-called "safe sanitary plumbing." Such ideas, spread by means of the daily press, are apt to do a great deal of harm. We are glad to note that "Architect's" ideas have been controverted by an architect of the highest standing, Mr. Carl Pfeiffer, who wrote to the *Evening Post* as follows:—

"Permit me to send you a few remarks referring to the letter of your correspondent 'Architect' in the *Evening Post* of to-day. I do not hesitate to take issue with him. His suggestion that all plumbing should be confined to one wing of a house may be pleasing to old fogies and to timid, nervous old women, but the advice to have no plumbing at all would, no doubt, be still more acceptable to them. If 'Architect' will call upon me I will show him in more than one house that there is not only no escape of any air or gases whatsoever from the plumbing pipes, but that the air of the room is sucked into the pipes. One of our well-known citizens and a resident of Murray Hill is so pleased with the plumbing of his house and feels so secure against the escape of sewer gas, after several years of trial, that he has assured me he would not hesitate to have an open end of his sewer-pipe close to his pillow at night. It seems odd that the same people who are so nervous about plumbing will sit for hours in the poisonous atmosphere of an unventilated parlor, theater, public hall, or church, contracting headaches and more serious diseases, without ever thinking of the necessity of pure air for their lungs. Much has been written against plumbing less reasonable than would be the suggestion to prohibit by law the manufacture of confectionery and the baking of pies and puddings."

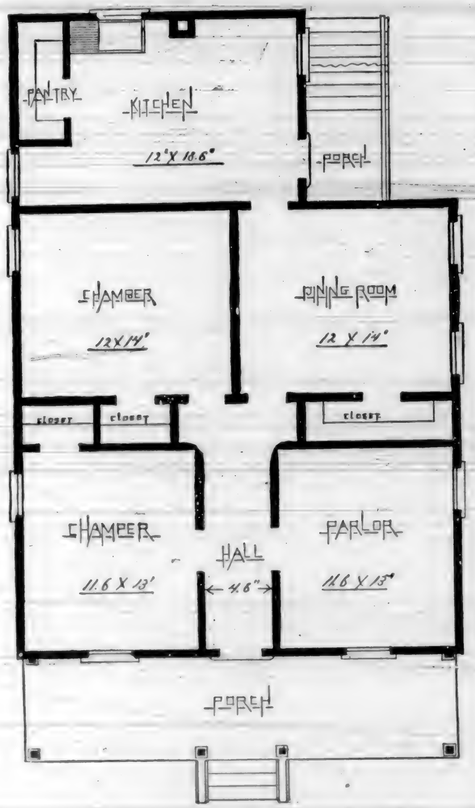
How to Make a Rust Joint.

FOR making a rust joint that will bear heat, cold, and rough usage, the following formula has been highly recommended: Ten parts iron filings, three parts chloride of lime, and enough water to make into paste. Put the mixture in between the pieces to be joined, and bolt them together, leaving until dry. After twelve hours the cement has been known to break off the solid iron.

Japan is said to have less than 10,000 paupers among her 37,000,000 inhabitants. In that country a man whose income is $1,000 a year is regarded as very wealthy.

A Cheap Five-Room Cottage.

THE tender care of an architect is essentially required when preparing a plan for those in humble circumstances, and yet whose pride must not be cast down by too plain an exterior, or too cramp interior. The plan presented is admirably adapted to meet the wants of the class referred to. The rooms are all of good size, with ample closets; plenty of light and means of ventilation are secured to each room. The house is so arranged that "modern conveniences" can be added at any time. According to the plan shown, the house can be built for a sum ranging from $1,500 to $1,800.



Hiders in the Bushes.

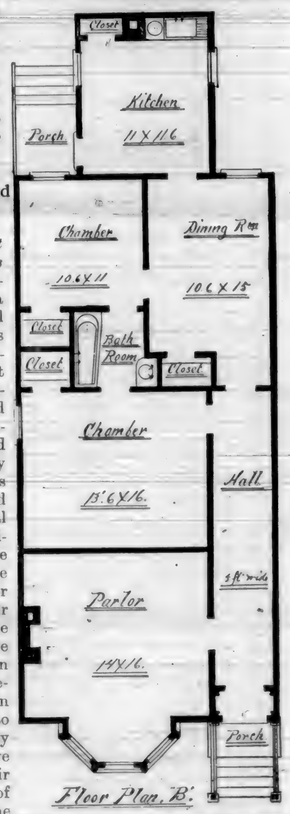
MANY subscribers outside the cities and counties in which papers and journals are published, withhold payment of subscription amounts under the fancied and dishonest protection of distance and difficult means of dunning and collection. Not being influenced or controlled by honest motives or purposes, nor shamed by the contempt expressed by publishers and authors universally, and smiling complacently under the lash of strongly worded denunciations from time to time found in print, they deem it smart to beat those who furnish them with valuable information or reading matter of interest, and think it *fine* to peruse journals and papers without paying for them, none of which is highway robbery nor burglary in the first degree, but is akin thereto in spirit, requiring simply the *occasion* and *courage* to perpetrate the higher crimes. Small thefts, cheating, peculations, and all of their kind are but the lesser offshoots and outgrowths of that more sturdy and defiant human growth, which, at times, is found under masks on the highways, with the deadly rifle, revolver, and the keen-edged dagger as means of defense. The nature that is so far tainted with dishonesty as to cheat, if it can, the publisher of any book or journal out of the rightful payment of the subscription cost, is one of the kind fitted to perform the role of brigand, provided the other requisites necessary to make up a bold and daring character could be contained within the skin of the man who seeks to *make* a dollar or two by *cheating the editor*.

Have we any of this kind on our subscription list? We hope not, and as proof that we have not, we further hope that every subscriber to this journal who has not, will at once forward their subscription balance up to December, 1886, at which time, or earlier, a new management will assume direction of its future.

A full list of delinquents will in due time be published in these columns.

Plan for a Narrow Lot.

FOR a narrow lot, the accompanying plan presents many inducements. Ample light is furnished each room, which are all of good size. Although not shown, a skylight over rear end of hall would be found to be a very useful addition; with a large transom over the door leading to principal chamber, the latter room would be much more cheerful. This house can be built anywhere from $1,300 to $1,500.



The Demand for a Good Pavement.

THE *American Architect and Building News* says: "One of the greatest needs of our cities is a wholly satisfactory material for paving. Many cities have grown weary in experimenting with this and that material, and are still casting about for new ideas and methods. Real estate owners on the busy streets find that the matter of noisy pavements seriously affects the rental of their stores and offices, and men with capital invested in team horses direct their drivers to sacrifice quick transit, and take roundabout streets rather than risk injury to their horses by traversing the greasy asphalt, or the equally insecure wooden blocks. The wooden pavements, that had their origin in the West, and sprang into favor a few years ago, largely because of their comparative cheapness, soon proved their unfitness for the uses of heavy travel. Besides the necessity for their frequent relaying, there was the difficulty experienced in keeping them down. Like the ghost of Banquo they cannot be depended on to remain "laid," as was strikingly shown not long ago in Devonshire Street, Boston, where a slight flooding of the street caused the pavement blocks to rise and float gaily with the tide.

Of the various kinds of asphalt or concrete that are used, opinions differ greatly. Of course much depends upon the particular kind used. Washington, Philadelphia, Cleveland, and other smaller cities, testify to good results from some forms of asphalt, but in Boston there is a pretty general concurrence of opinion against the material. Teamsters, especially, condemn it largely. In Detroit there has been an experiment on a small scale with a hard brick pavement, which is said to have stood the test of heavy travel with considerable success. The smoothness of this surface, however, it seems, must be a serious drawback, if generally adopted. A material that is coming in favor in Western cities is crushed Michigan granite, which has the quality of readily cementing itself and proving very durable, while making roadways sufficiently smooth to obviate undue noise. Its expensiveness is one argument against its more general adoption; but cheap and experimental pavements have certainly had as much attention as they deserve.

In order to close out our large stock of books on hand, we will make a reduction of TEN per cent on the publisher's price. Any book can be furnished by us, no matter what the name, or the cost thereof.

Cooking Water.

CHARLES DELMONICO used to say of the hot-water cure: "The Delmonicos were the first to recommend it to guests who complained of having no appetite. 'Take a cup of hot water and lemon, and you will feel better,' was the formula adopted." For this anti-anorexic remedy the caterers charged the price of a drink of their best liquors, twenty-five cents or more, and it certainly was a wiser way to spend small change than in alcohol. "Few people know how to cook water," Charles used to affirm. "The secret is in putting good, fresh water into a neat kettle, already quite warm, and setting the water to boiling quickly, and then taking it right off to use in tea, coffee, or other drinks, before it is spoiled. To let it steam, and simmer, and evaporate until the good water is all in the atmosphere, and the lime and iron and dregs left in the kettle—bah! that is what makes a good many people sick, and is worse than no water at all."

I am very glad to find such excellent authority on a question which has vexed me sorely, not only because of my own epicurean tastes, but because it was nearly impossible to obtain properly cooked water for invalids and convalescents. A critical taste will detect at the first mouthful, if the nose has not already demurred and given warning, the faintest trace of dead-water in tea, coffee, porridge, and many other items designed for the stomach.

More frequently than otherwise, the breakfast kettle is set boiling with a remnant of yesterday's supply in it; the coffee-urn has been neither washed, dried, sunned, nor aired; possibly, in the interest of a rigid and mistaken economy, some of yesterday's coffee is also "boiled over," and the partakers wonder at their lassitude and dyspeptic conditions. Whatever else be neglected, the tea-kettle and its associate pots should be thoroughly cleansed, dried, and aired every day; and in no case should water that has stood even an hour in pitcher, pail, or kettle be used for cooking.

If people will drink tea and coffee, let them at least have it as nearly free from poisonous conditions as possible. That much benefit may be derived by many people from drinking hot water is not disputed, but the water should be freshly drawn, quickly boiled in a clean and perfect vessel, and immediately used. The times of using, the adding of milk, mint, lemon, or other fruit juices, is a matter of preference or special prescription. This article has in view the perfect preparation of boiled or "cooked" water.

Fire Protection.

THE Eureka Fire Hose Company of New York, is manufacturing a light, strong, cotton, rubber-lined fire-hose, called the "Eureka Mill," which has proven to be the most durable and reliable, and the easiest hose to handle ever made. It is lined with the finest Para rubber, and has now been in a large number of hotels, factories, public buildings, etc., for fire protection for the past ten years, and although in many cases hung over hooks or pegs with short kinks, which would ruin rubber hose in six months, it is still as strong and perfect and reliable for fire duty as when first put in. It is undoubtedly the only hose to use for fire protection, for there is practically no deterioration with age, and it stands an immense pressure, while the rubber hose of to-day is unreliable after six months, good-for-nothing after twelve, stands very little pressure even when new, and is stiff and hard to handle. No hotel, mill, factory, public building, or large building of any kind should be without some inside fire protection. Manufacturers and others of experience always look to it that they are well supplied in this direction, and only those who come directly in contact with this trade begin to realize how often inside fire protection of the right kind really prevents great conflagrations, or at least renders unnecessary the dragging in of the large, dirty heavy hose of the fire department, and the use and misuse of a large amount of water. A fire should be taken at the start, and this cannot be done unless the hose is handy, and is light, so that the gentler sex may handle it if necessary, and must be strong to insure efficiency and as a protection against the damage caused by bursted hose. In some of the large buildings going up in this city to-day, there has been no provision whatever made for fire protection, and it behooves the architects of these buildings to bestir themselves and make some provision of pipes, etc., before it is too late, or they may at some future day be severely censured for neglecting to attend to so important matter. There are a large number of buildings and manufactories in this city now supplied with this hose, and we shall give a list of them at some future day. But we desire particularly to call the attention of those interested, to hose as seen in the fire-closets of the Baldwin Hotel, where it has been since the hotel was completed, over ten years ago, and is to-day as perfect as when first put in.

The agency for the Pacific Coast is in the hands of W. T. Y. Schenck, 256 Market Street, who makes a specialty of fire hose and fire department apparatus and supplies.

Rules Regarding Cement.

EMINENT engineers are authority for the following important conclusions:—

Cold water is probably not injurious, only as it retards setting.

All cements when mixed with sand to a proper consistence for mortar will fall to pieces if placed in water before setting has commenced. Portlands do so even without sand.

Pressure while setting, with the degree of the thoroughness of the mixing or the gauging, the proportion of water used, and other considerations, may easily affect the results one hundred per cent, or even much more.

If too much water is present in mortar, the consolidation by ramming is proportionally imperfect.

Any American cement of good quality will with one and one-half to two measures of sand give a mortar strong enough for most engineering purposes.

American cement requires less water than Portland.

Sand retards setting, so that cement which, by itself, would set in half an hour, may not do so for some days if mixed with sand.

When one part sand is added to one part of cement, the strength is lessened one-half. Two parts of sand to one of cement, averages about one-third the strength of pure cement. These for tensils and transverse strains. The crushing strength does not diminish so rapidly.

Brick or stone should be moist and entirely free from dust, or mortar will not adhere.

Slacked lime retards the setting of cement.

The temperature of air and water has far more influence in the testing of cements than has before been suspected.

After using in air, cement, or cement with sand, should be kept moist or watered until completely hard.

Walls of buildings are often built of cement concrete deposited between smooth-faced planks as a mould, the planks being moved upwards as the work goes on. Cement should be nearly dry and tamped hard.

Post holes running down below frost and tamped full with concrete are safe and economical supports for warehouses and similar buildings.

Concrete may be used in large masses under water, and when properly put down, is found good for piers and shore protection.

One-quarter to one-half cement is a common rule of mixture for cement and lime for plaster work in air.

Neither concrete nor cement can be emptied in water loose with good results, but must be conveyed to place in boxes or bags.

The white efflorescence, most common to Portland cement, is supposed to be injurious to the strength of brick and other materials.

Any disturbance of cement after setting commences is prejudicial to strength.

The best sand for concrete is that with angular, coarse grains of uneven size. The more uneven the sizes, the less the voids, and the coarser the grains, the less quantity of cement required to cover the surface.

MECHANICS' GEOMETRY,

— OR THE —

Science of Framing by the Aid of Cardboard Models.

We have lately received a number of this Celebrated Work, and will forward a copy to any address —$5.00, less 10 per cent.

THE new city hall of Philadelphia is the largest building in the United States. It has already cost $12,000,000 and covers 3,000 square feet of ground more than the Washington Capitol. Its north side tower will rise 535 feet, making its height only 20 feet less than that of the Washington Monument.

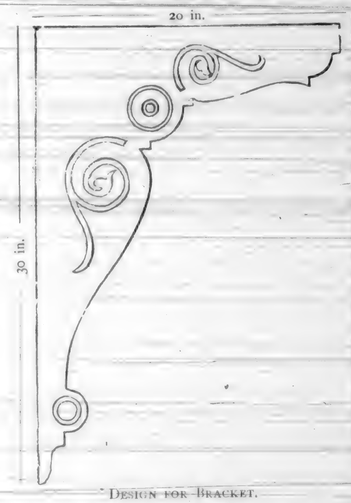
In our December issue we will publish complete a list of those who are in arrears for subscriptions to this journal. Avoid publicity by sending us the amount of your indebtedness immediately.

ART AND ARCHITECTURE.

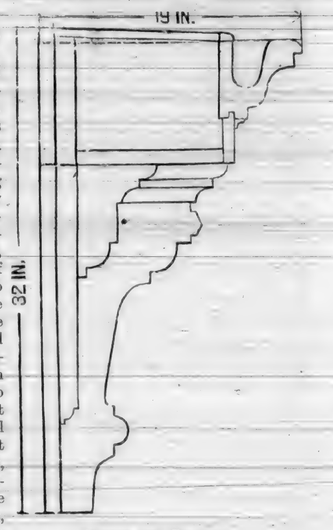
[Special for this Journal. By F. Hillert, Architect and Mechanical Engineer.]

XXXI. PERIODICAL ART OF THE MIDDLE AGE.

THE spreading of Christianity changed the whole state of things, and the Middle Age does not any more know national differences in art. Of the nations which did not come within the historical development, not considering themselves the art of the Middle Age, are the Christian and the Mohammedan. The latter carried with it so many restrictions, coming from religious commandments, that it was struck with a destiny like so many of the old arts, the same remained typical, and its progressive development is only very small. But it has, with the Christian art, the same property in common that it ruled a number of nations, that it forced the same on every new conquest made, together with the Koran, the holy book of the prophet, from the shores of the Ganges to that of the Ebro. So far as the victorious arms of the sons of Mohammed penetrated, monuments and traces of them are found, but all of them show the same typical form, the same style.



Design for Bracket.



Design for Bracket.

It is different with the Christian art. The Christian doctrine was by the different Christian nations differently taken up, conceived and retained, and in the course of time was developed and became church religion, changed and alternately transformed. The main cause of such transformations was the bodily and spiritual conflicts which were conducted for the defense and propagation, and always obtained a living stream, through which every involuntary or designed stoppage by priests became impossible for any length of time. Art followed all phases of religious development, and always took new forms and modes of expression. There are four main groups to distinguish, to which we must unite the similar monuments, and in course of time they followed each other. It originated periods, which mark a characteristic division of the art of the Middle Ages, which were largely and as a whole in common to all Christian nations, naturally without detriment to the above-mentioned special perceptions and singularities. In the first centuries of the independent Christianity, the relations to the antiquity were numerous and of considerable influence, that the same leaning to the antique traditions, formed an art, in which the Christian elements, as it were, slumbered in the bud; this is the so-called period of the ancient Christians. In the Byzantinian is already marked an important step to an independent originality. It alone satisfied itself to arrive at a certain height, then rested, and remained standing in a lifeless rigidity without developing itself to perfection. It reigned over a large portion of Western Europe, besides its native land, the Greek Empire, and soon the same became displaced by an art, the principle of which originated and grew in Germany, by transforming and uniting the forms of previous centuries to a new art. In this way originated the Romanic style, which expanded over all Christian countries at the time, except Byzanz; and the same again became displaced by the Gothic, taking and completing the same route through the Christian nations. As far as the origin of the four periods and the development of the different styles were concerned, and of any influence with and on the religious perceptions, and the churchship, is a problem not here to be discussed; but in general we will find in the ancient church and the immediate intonation of the latter, antiquity; in the Byzantine, the turning away from the occidental development and perception; in the Roman, the first independent innovation of the original force of the spirit of the German people; and, lastly, in the Gothic we find expressed the highest development of the church idea of the Middle Age. But that in common to all these periods, and uniting the same to a whole, is the Christian element, and thus a direct and clear view of the Christian religion is everywhere recognized in the works of art.

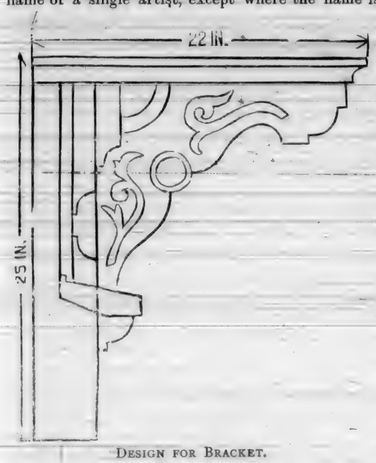
XXXII. UNIVERSAL INDIVIDUAL ART OF OUR TIME.

With our time the state of affairs is seemingly changed, but only seemingly, that the new religion, which is now forming, and the art, acting developingly, are the spirit of humanity. The coarse, the sensual, has outlived itself, and a nobler and finer spirit conditioned a refined perception. New gods were not proclaimed, but in the breasts of men spoke a sentiment, an inner, invisible voice of a new love. Before the Reformation, this spirit already lived and existed in the nobler natures, and it was the same which brought and called forth, suddenly, the hidden to expression, and to collect together every interest in the combat about the sacred endowments and goods, beside which disappeared the contemplative rest of artistic activity. This led to the highest flourish in art. The noble mind comprehended all which was worthy to be offered, not only breaking the narrow boundaries of ecclesiastic conception, and placing, in place of the supernatural, the human perfection, but also by enlivening the spirit of past times, knowing no boundary than the one it made itself, it became universal,

embracing the whole humanity, and what the same offered to it, as also individual, since that which it received it regenerated out of itself, adorned with the seal of its own spirit. Art in modern times is also universal in reference to the sphere of its objects and forms; individually in reference to the producing artist. Neither in the ancient times, nor in the Middle Ages impressed itself as such in an eminent manner in the works of art. The individuality of its originator, then the feeling, sentiment, and perception of all was the same, and the differences in the works of the artists, originated by their personalities, properties, and perceptions, were proportionately subordinate, so that the person of the master had to recede and stand back. Scopas and Praxiteles created works which in their artistical spirit were alike, and the same is the case with all the preserved Greek sculptures, that we can weigh on the same the measure of beauty, the grace of the technical execution, but we are incapable to give the name of a single artist, except where the name is preserved by traditions.



Design for Bracket.

Similar is the Middle Ages, where the plastic had a smaller practice, and the significant preference extended to the art of painting, on account of the favorable spirit, should have called forth a noted expression on the individuality of the artist who should have been called upon for the remembering and expression of the Christian mode of perception. Style and perception are, on the large and the whole, everywhere the same, and only in our time is it the case that artists and their art schools, in their works, manifest and reveal a peculiar style, and a singular artistic character of their own. In our time the person of the artist is in art, and in its full appreciation, and in regard to objects made, no sphere of life, of history, or of nature is excluded. On the admission of the artistic treatment only the poetic value is decisive, and no other laws conduct and lead to art than those established by itself. The right of the individuality is so extensive, that where a pressure from the outside is tried, let it be by political power, or ecclesiastic influence or despotism, such power always, beginning with the lowering of the artist, degrades art, not worthy to be called so, or, what is better, the same causes a general retreat from within its reach.

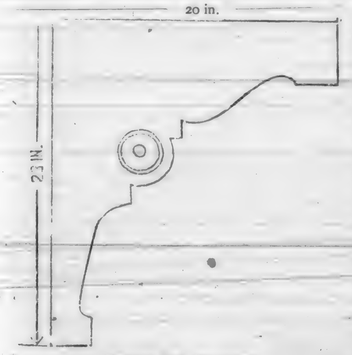
Design for Bracket.

Art demands and requires unconditional liberty. It is looked upon with suspicion; and when compelled to execute commands of caprice, it is lost; and the one who tries to guide and manage the same to his will, will be punished with the total loss of the art. History does not lack examples of this kind.

XXXIII. FUTURE.

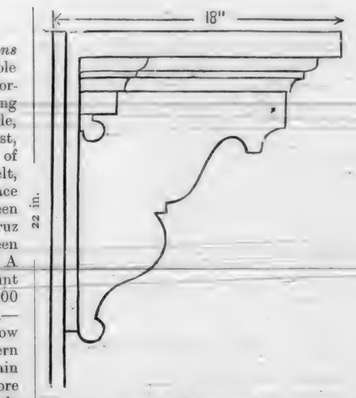
With this course, seemingly, the development of art in the main possibilities of its beginning, has passed through, and only through and from, the persons of eminent artists and cultured people, who exert an important influence. The pure national and the pure Christian art is buried for all time to come; then only the breaking in of a raw but gifted people of nature could destroy the old culture and art, and, beginning new, could create a natural religious art. But who could believe in the possibility of such incredible events; but what might occur after the wreck of the European people, shall not concern us. Largely gifted men of genius will, as long as our historical culture lasts, produce large, flourishing times of art, and out of the decline and ruin only the conscientious deeds and actions of the manly spirit will be saved from sinking. That the declining of flourishing art is not the work of accident or caprice, but that all goes to conform to unchangeable laws, based on nature, will next be spoken of.

Redwood.



Design for Bracket.

THE redwood—*sequoia sempervirens*—is found in any considerable quantity nowhere but in California, in a belt about 400 miles long from north to south, and 30 miles wide, on the average, from east to west, which lies upon the western slope of the Coast Range. North of this belt, pine, fir, and spruce gradually displace the redwood. The region lying between the northern boundary of Santa Cruz County and Russian River has been stripped of this precious timber. A recent careful estimate puts the amount of standing redwood at 26,000,000,000 feet, and the yearly consumption—which is constantly increasing—now reaches 200,000,000. In the southern part of the belt, where there is less rain and fog, the tree does not average more than two or three feet in diameter, and the wood is hard and flinty. Further north, in Humboldt County, the size increases, so that specimens twelve to eighteen feet in diameter and from 150 to 250 feet high are not uncommon; on large tracts experts estimate a quarter million feet per acre. The average size of saw-logs is six and eight feet in diameter. The wood is soft, coarse-grained, and very brittle, and so straight in grain that often it is not a hard matter to split out inch boards eight or ten inches wide, and from ten to fifteen feet long. When dry it is lighter than pine, spruce, or fir. Yet the butt log will often sink in water, when the top logs float like cork. The growth is slow, the annual rings often indicating an age of thousands of years. As the bark, which is very thick, soft, and fibrous, contains no resin, fires which run through the woods do not kill the standing timber, but, of course, must injure young sprouts. The great durability of the wood makes it desirable for shingles, railroad ties, and fence posts. It is highly valued for tannery tanks, which often last ten years, as the tanning solution does not act upon it as upon other woods. Wine merchants

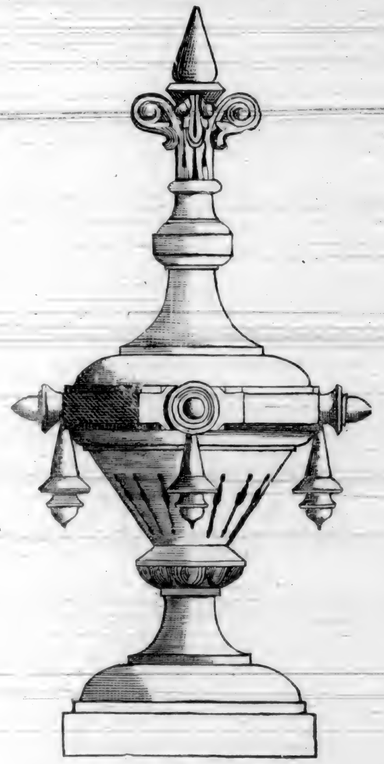


Design for Bracket.

also seek it for vats, because a certain insect found in new grape juice, which bores pine readily, appears to dislike redwood. As its color is similar to that of Spanish cedar, and imparts no flavor to tobacco, it is prized for cigar boxes, and is largely used in New York for that purpose. Its extensive use in buildings, it is claimed, largely accounts for the immunity of San Francisco and other coast cities from large fires, there being little or no resin in it, and therefore less difficulty in putting out fire when once started. Some of the grain curls so that when polished and varnished, it rivals rosewood for cabinet uses.

Knots in Lumber.

"YOU would probably be surprised," remarked an observing lumberman the other day, "to see how some of my country orders run. I have customers who won't have a knot imperfection in their lumber, if they can help it, but who will take lumber so shaky it will hardly hold together, without a kick.



Ornament For Fence Post.

Indeed, if it looks well, they are very likely to send in another order to be filled out of the same lot. Now, every practical lumberman knows that for ordinary use, such as lumber is applied to by most country buyers, a good sound knot does not hurt it a particle, while shake is more or less of defect for any purpose. It used to puzzle me to account for this peculiarity on the part of some of my country friends, until I happened, while out on the road one day, to drop into the office of a man whose purchases run to this sort of lumber. I had some particularly good stock, in which the imperfection was chiefly confined to knots. It was sound, and I thought it an especially desirable lot of lumber of the grade. I wanted to send him a car load, but, though I argued diligently with him, he would not buy. Finally he asked me to go out into the yard and see how his sales ran. I did so, and an hour's observation convinced me that he knew what he wanted better than I did. The grangers who came in to buy would invariably kick about the knots, but show them nice, clean-looking boards that were shaky, and they would take them every time, in preference to lumber that was really better in every respect, but the imperfection of which was apparent on the face of it. I marveled no longer at the seeming peculiarity of my friend's taste in lumber, and whenever he sends in his orders now, endeavor to give him what will best satisfy his customers." And, no doubt, there are many among the retail dealers, even, who do not appreciate the comparative worthlessness of shaky stock as compared with that which is only defective because it is knotty, though the knots may be red and sound. Buyers have been known to object vigorously to a really excellent article of dimension which showed a good many knots, and take in lieu of it, at the same price, cleaner looking, but not nearly so good, stock in which the imperfection was chiefly shake. Unless the difference is carefully pointed out to a user, he is not apt to discover it. A shaky piece of lumber, where the defect is not so great as to entirely destroy its usefulness, makes a very presentable appearance, and this is what users largely depend upon in judging of it. They buy it, and use it, and when it afterwards shows a disposition to crack and split, they, as likely as not, lay the blame upon the paint, or the weather, or some other cause which has nothing in the world to do with it. And when they buy again, they make the same mistake. It would not in many instances be possible to convince such people that they are wrong in their judgment, and perhaps it is not the best policy to try.

Unnoticed Dangers.

FAR too many houses, both in the city and country, stand on made land or at least that which was formerly swampy. The foundation walls, when there are any, for houses often stand on posts alone, are built of solid masonry, but with no cement either outside or in. Such walls are porous and soak up water nearly as rapidly as a sponge. Then it slowly trickles down the inside, emitting malaria and forming a fine soil in which all matter of fungoid growths flourishes. The rooms over such places are first-class disease breeders, and every home should be frequently examined to see that these dangers do not exist.

The drain pipes often leak in cellar and basement. This adds to the danger of the rooms above; the two fiends, stagnant water from the sewer and water filtering in through the walls, work in concert to sap the life of the little ones, and to fit them to yield to the first disease.

The walls of the rooms themselves, in far too many houses, are disease breeders. A neat and tasty paper upon the wall makes a room inviting and adds to the home comfort. But, unfortunately, even when the paper is made free from poison, and good paper can be so made, the paste with which it is attached is just the home for minute organisms which produce certain diseases. This is bad enough when there is only a single layer of paper, but when, as is often the case, several layers of paper and paste are laid on the same wall, outside of one another, the danger is multiplied many times; such walls are really masses of festering filth; the best wall is undoubtedly the plain plastered wall.

All cases like these demand caution. Those who are responsible for the home comfort, cannot be too careful; the health, often the life, of the loved ones, particularly children, depends upon rigid exclusion of all these lurking-places of disease and breeders of death. Beauty should be and is consistent with perfect safety in the home.

Sharpen your tools properly and you will husband your strength.

Please Make Immediate Settlement.

Selections from Goethe.

WE like to look into the future because we desire the incidental, which we know lies therein, to point our way.

We cannot well be in any company without thinking: the accident that brings us together in a crowd we expect to contain friends of ours.

We may live as retired as we please, still we will be either a debtor or a creditor.

If we meet a body indebted to us we are sure to remember the fact; but when we meet a person to whom we are indebted, ten to one we will forget the fact.

Nobody would talk much in a crowd if they knew how many misunderstood them.

To be communicative, comes by nature; to adopt what others tell us, is culture.

It is presumable that the speeches of others are so much misquoted because they are really not understood.

Whoever talks long before others without flattering them, becomes obnoxious.

Every word expressed causes counter thought.

Both flattery and opposition make conversation disagreeable.

Nothing indicates men's character better than their ideas of what is ridiculous.

Sensual men laugh where there is nothing to laugh about.

To the intelligent most everything is ridiculous; to the reasonable, almost nothing.

Passions are vices or virtues; they are, however, always intensified.

The golden mean is in nothing more desirable than in our confidence in or mistrust of those we love.

A passion is tempered by confession.

Fire Hose and Garden Hose, W. T. Y. Schenck, 256 Market Street.

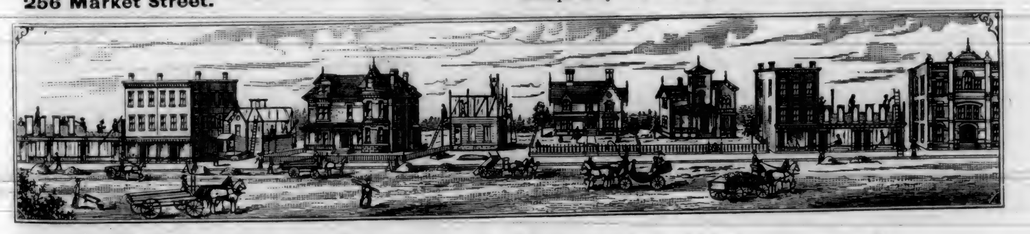
In our December issue we will publish complete a list of those who are in arrears for subscriptions to this journal. Avoid publicity by sending us the amount of your indebtedness immediately.

A simple and convenient way of obtaining the weight of cast iron when the number of cubic inches is known, is to divide the number of cubic inches by 4 and then add one per cent of the cubic inches. The result is exactly the same as if it had been multiplied by .26, the weight of one cubic inch.



Bush, bet Powell and Mason. Three-story frame.
O.—S. Manin.
A.—H. Geilfuss.
C.—J. H. McKay.
$6,800.

Brosnan, nr. Valencia. Two-story frame.
O. and B.—J. Perry.
Day work.
$2,200.

Broderick, nr. Hayes. Two-story frame.
O.—J. S. Antonelle.
A.—J. J. & T. D. Newsom.
C.—J. G. Adams.
$8,000.

Bluxome, bet. Fifth and Sixth. One-story brick warehouse.
O.—J. L. Moody.
A.—C. I. Havens.
C.—W. M. Fletcher
$8,500.

Baker, nr. California. Two-story frame.
O. and B.—Geo. Hinkle.
Day work.
$4,000.

Skow; $600. Two-story frame on University Tract. A., Theodore Lenzen; C., A. J. McIlvain; $2,500. A frame pump house. O., San Jose Water Co.; A., Theodore Lenzen; C., G. E. McDougall; $700.

Fresno City—Two-story brick. O., J. M. Brady; A., Theodore Lenzen; $10,000.

Tulare City—Two-story and and basement brick. O., J. Goldman & Co.; A., H. C. Macy $10,000.

HILL'S PATENT INSIDE SLIDING WINDOW BLINDS

Are Adapted to Any Style of Window

And Suitable for all Buildings, Dwellings, Stores, Office Buildings, and for Houses Built to Rent, Hotels, Boarding or Lodging-Houses are Unexcelled.

THEY are entirely inside of the window casing, and while requiring no furring out or boxing, make it an impossibility to tear curtains, interfere with plants or window ornaments, or become broken by contact with chairs or other movable articles.

The light can be admitted and sunlight excluded from any part of the window; can be instantly removed and taken to any part of the house to clean, and as easily replaced.

They can be opened or closed with the window raised, and without removing articles from the window-sill, and cannot blow open or rattle. The Blind is very light (one-half inch in thickness) and strong, possessing more durable qualities than a hinged blind one inch in thickness.

There is NO SAGGING, BANGING, OR GETTING OUT OF ORDER!

They are made in three sections in height (each section sliding past the others), and any number of divisions in width corresponding to the folds in the old-fashioned folding blinds. They require NO HINGES—all trimmings furnished with blinds—are MADE OF ALL WOODS, finished or unfinished, and COST LESS than old-style folding blinds. They have been extensively used by the best architects and builders throughout the East and West, and have given perfect and entire satisfaction wherever introduced.

ENGLISH AND AMERICAN VENETIAN BLINDS (IMPROVED).

The only perfect Venetian Blind in the market. The Blinds can be seen at the Mechanics' Fair. Or for samples, prices, and further information, address as below.

The following are a few of the owners who have adopted the HILL BLIND in preference to any other:—

L. M. Fabry, cor. Hayes and Laguna; architects, Miller & Armitage. John MacKenzie, cor. Grove and Broderick; architect, H. D. Mitchel. H. F. Bruns, cor. Geary and Taylor; architect, John M. Curtis. THE CALIFORNIA ARCHITECT AND BUILDING NEWS.

VOLUME VII. ENTERED AT POST-OFFICE, SAN FRANCISCO, AS SECOND-CLASS MAIL MATTER. ESTABLISHED JANUARY, 1879. NUMBER 11.

THE

California Architect & Building News.

A MONTHLY JOURNAL,

Devoted to Architecture, Decorating, and Furnishing.

PRICE, $2.00 PER ANNUM.

The official organ of the Pacific Coast Association of Architects. Published by the SAN FRANCISCO ARCHITECTURAL PUBLISHING CO. No. 240 MONTGOMERY STREET, Rooms 11, 12, 13.

Subscribers will please notify us promptly of any failure to receive this journal, and also of any change in their address.

Advertisements inserted at reasonable rates.

SAN FRANCISCO, CAL., NOVEMBER 15, 1886.

EIGHTY-FOURTH MONTHLY ISSUE.

Completion of Its Seventh Volume as a Monthly.

ITS publication being commenced in January, 1880, but one more number—that of December—remains to complete its *seventh* volume as a monthly—EIGHT, including Quarterly of 1879.

For the purpose of establishing this Journal, and securing for it the reputation it at present enjoys, of being *excelled by but few of like character published in the United States*, neither expense, effort, attention, nor personal, mental, or physical energies or application, have been spared. Upon the issue of reputation we submit the testimony of those who have read the contents of its columns, and given unsolicited testimony.

During the period named there have been issued and circulated of monthly issues, including two supplemental editions,

MORE THAN 350,000 COPIES.

No *monthly* journal, certainly none of class character published within the Pacific States, and but few class monthlies within the United States, can make an equal showing. And when all the material facts, conditions, and surroundings are considered, the conclusion that a great work has been performed, must be reached and admitted; for at the beginning there was scarce a single auxiliary available, in good and practically perfected shape. Crudeness and inexperience,

FROM EDITOR TO "PRINTER'S DEVIL,"

was the order of things, and in addition to *doing* that which was to be done, the secret of *how best to do it*, had to be learned.

WITH THE SAME DEGREE OF ENERGY AND ENTERPRISE IN EXERCISE DURING THE NEXT AND SUCCEEDING YEARS,

it is reasonable to anticipate greatly enlarged results, and to see this Journal excelled only by the very few old and long-established journals, published at the great centers of population and enterprises, where scores of millions of dollars are expended annually within a single city or county in the erection of buildings alone, and hundreds of thousands of mechanics and artisans are employed daily upon constructive works.

But to accomplish this, subscription patronage must be extensive and promptly paid, and advertising support liberal. The cost and expense of each issue must be paid monthly, whether or no the management receives its pay from patrons. Every patron who fails to pay up at the proper time, should bear in mind the fact, when he first opens each monthly number, that he is enjoying the instructions and benefits of a publication which has cost some one else a certain amount of money, and a sense of honesty and fair dealing should not only prompt, but compel immediate payment of subscription amount.

We hope that the patrons of this Journal will consider this important matter in its equitable and just light, and by or before or during the month of January,

SEND IN THEIR SUBSCRIPTIONS FOR 1887.

Be sure to obtain the December number.

Retrospect.

IN looking back over the past seven years, as founder and editor of this Journal, very many pleasing recollections present themselves, which will not be forgotten while life lasts.

The numerous expressions of personal good-will, friendly feelings, hearty wishes for our success, approval of efforts made, and many expressions of kindly import, have been sources of great pleasure.

While some men conduct and manage newspapers and journals for personal objects and purposes, and shrink from no act, however vile and depraved, to further their designs, nor any means, however corrupt, that will yield gold, even at the expense of truth, honor, or fairness, the chief object of every intelligent and honorable man editing, managing, or to any extent controlling a publication of any character, is to inform, instruct, and edify those who read, in printed form, the thoughts that flow from a pure mind. With truth and right as a bulwark, every good man who wields the pen as an editor, finds an eminent reward in the approbation of those who read his mind productions; not in a feeling of vanity that he has pleased, but in a sense of solid satisfaction at having so expressed himself as to receive approval from others, alike with himself, intelligent and well disposed.

While acknowledging personal defects and short-comings, and a lack of those marked scholarly and intellectual abilities, such as thousands in journalistic pursuits enjoy, we lay honest claim to purity of purpose in the conduct of this Journal. In no instance has there been any purpose to deceive, mislead, or misrepresent. An earnest desire to do justice to all, wrong to none, and to inform, instruct, and benefit our patrons, has been the controlling motive influencing every line from our pen or pencil.

Summary for November.

58 Frames	$282,335
16 Alterations and Additions	36,500
4 Brick	112,950
78 engagements. Total cost	$431,785

Delinquent Subscribers.

IT is astonishing with what cool unconcern some people permit their subscription indebtedness to journals to remain unpaid.

There seems to be no sense of shame or principle of right and fair dealings with such people; true, sometimes good and honest men *forget* to pay small indebtednesses, and the object of this notice is to refresh the memory of such good and honest men who have not paid up, that we will very thankfully receive the amount due us, if they will kindly forward the same during the present month.

How Axes Are Made.

IN the manufacture of axes, the material passes through twelve different operations before it is ready for labeling and boxing.

At first it is a rectangular piece of iron, about three-fourths of an inch thick, three and one-half inches wide, and about six inches long. The bit is of steel, and in some instances is inserted in a slit made in the iron, and in others it is drawn over the edge of the iron. There is a growing demand for axes made entirely of steel. The most important part of the process of manufacturing is tempering. "This is really where the axe is made," said a manufacturer. The grinding and polishing is the most laborious part of the process. It is here that the rough, irregular-shaped semblance of an axe is ground and polished until it is as bright as a mirror. It is said that the work will prove fatal within five years to any man who pursues it steadily. The air is filled with imperceptible dust from the stones, and many of the workmen tie small sponges saturated with water over their nostrils.

Fire Hose and Garden Hose, W. T. Y. Schenck, 256 Market Street.

Paper Read Before the S. F. Chapter American Institute Architects, by Fellow G. H. Sanders, Nov. 5, 1886.

Mr. President and Gentlemen: The resisting power of our building stones to vertical pressure having been at various times brought to our notice, we decided to settle the question by actual test. Finding that there was a hydraulic press at the miners' foundry, we decided to take advantage of the courtesy of the proprietors, who kindly placed the apparatus at our disposal. Through the good offices of P. H. Jackson all preparations were made, and early in the month all was ready, and the tests were made.

Having at sundry times collected a number of blocks of stone and granite and bricks of various kinds, we were enabled to test the following materials, viz.: Penryn granite, Miles freestone, Sutro Heights stone, San Jose sandstone, Stock brick, San Jose pressed brick, Chicago pressed brick, Lincoln Hollow brick, and some ordinary concrete blocks. Unfortunately, it soon transpired that the adjustment of the press was not such as to insure anything like a crucial test, the faces of the piston and abutment block not being parallel with each other and the faces of both. But especially the abutment block, which was loosely held between two jaws of an upright stanchion piece (see diagram), was quite rough and rusty from exposure to the air, so that though hoop iron was used to pack and adjust the abutment block, it was impossible with such means to bring their faces into anything like parallelism. The hurry, too, with which the experiments were conducted prevented the possibility of those careful observations and abundant notes which render such experiments really valuable.

Perhaps after all the chief benefit derived from the tests was finding out, in view of a future occasion, how *not* to do it. Nevertheless, the experiments were of a great interest. In the first place, the question of bedding occurs. Some of the blocks were crushed between pine boards, others between sheets of thick lead. The result seemed to be indifferent, in some cases the lead, and in others the pine, seeming to gain the higher result. In one case a brick (the Stock brick) was bedded in cement, but the cement was not allowed sufficient time to set, so that the result was nearly *nil*. We believe that every specimen should be bedded between plates of planed iron in pure, sifted cement, and thoroughly set, prepared, perhaps, a month or more beforehand, and then placed between truly planed, mathematically adjusted surfaces of the ram. Under such circumstances alone can uniform and reliable results be looked for with any confidence. Secondly, it also appears, from the results which will be laid before you, that, as probably might be expected, the largest specimens give the lowest results as to the relative resistance per square inch of area. Thus a block of sandstone 3x3x3 gives a resistance of 75 tons ultimate crushing strength, or a resistance per square inch of area of 9,312½ pounds; whereas, a block of Penryn granite 6x6x6 gives an ultimate crushing strength of 128 tons, but a resistance per square inch of surface of only 7,727⅜ pounds. Possibly this is due, to some extent, to the greater difficulty of adjusting the pressure over the whole of a large surface equally, than in the case of a surface ¼ the area. Otherwise one would suppose that the greater bulk should offer as proportionately greater a resistance.

One other point it may be well to notice, namely, the almost uniform occurrence of cracks, spalting, or other partial failure of the material, early in the process of crushing. This is no doubt due to the gradual adjustment of the blocks to the conditions of pressure brought to bear upon them, after which, every part having been brought to an equal bearing, the block is in a position to sustain the pressure until the ultimate limit of resistance is reached. On this account, granting that the surfaces of the ram and the surfaces of the best blocks can be brought to perfect adjustment, there is no doubt that, as some experimenters have found, the highest result would be reached without any intervening bedding substance whatever.

STONE TESTS.

No. 1. San Jose Sandstone.
Block 6x6x6 = area 36 inches. (Note—between sheets of lead.)
20 tons spalted on edge.
50 " " "
70 " badly crushed—3,944½ lbs., 1 inch area.

No. 2. San Jose Sandstone.
Block 6x6x6 = area 36. (Between sheets of lead.)
10 tons slightly cracked.
55 " bulged on top.
75 " split and crushed—4,166⅔ lbs., 1 inch area.

No. 3. Miles Freestone.
6x5½x6 = area 33.
60 tons spalted on top.
70 " cracked in middle.
75 " " "
85 " " in opening.
100 " crushed—6,060⅔ lbs., 1 inch area.

No. 4. Penryn Granite.
6x5½x6 = area 33.
95 tons cracks on top.
105 " more cracks.
110 " badly cracked.
115 " " "
128 " " crushed—7,727 3-11 lbs., 1 inch area.

No. 5. Sutro Heights Metamorphic Sandstone.
4x4x3⅜ = area 16.
15 tons corner came off.
30 " cracked on top.
55 " " in middle.
60 " crushed—7,500 lbs., 1 inch area.

No. 6. Block of Concrete (made about Jan. 1, 1886).
Composed of 2 vols. fine gravel.
" " 1 " coarse gravel.
" " 2 " broken rock.
" " 1 " Portland cement.
Or 5 of rock to 1 of " "
4 in. x 5 in. x 4 in. thick (6 months old).
20 tons cracked.
30 " crushed—2,500 lbs., 1 inch area.

No. 7. Block of Concrete (same age and size).
20 tons cracked.
32 " crushed—2,666 lbs., 1 inch area.

No. 8. San Jose Sandstone Brick.
8x4½x2⅝ = 31½ in. area.
Ram, 8 inches diameter.
15 tons cracked on top.
30 " badly cracked at ends.
55 " cracked in middle.
80 " crushed on top.
85 " thoroughly crushed—5,312½ lbs., 1 inch area.
(The above placed between lead plates.)

No. 9. San Jose Sandstone Brick. (Placed between pine boards ⅜ inches thick.)
60 tons cracked.
80 " crushed—5,000 lbs., 1 inch area.

No. 10. San Jose Sandstone Block. (Placed between lead plates.)
3x3x3.
15 tons spalted.
25 " crushed—5,555 lbs., 1 inch area.

No. 11. San Jose Sandstone Block. (Placed between pine boards.)
4x4x3⅜.
70 tons cracked.
75 " crushed suddenly and completely—9,312½ lbs., 1 inch area.

No. 12. 4½x3⅜x4½ block (between pine boards.)
30 tons cracked.
40 " crushed—5,333⅓ lbs., 1 inch area.

No. 13. Sacramento Stock Brick (rough).
4x8x2½ (between wood) = 32 inches area.
20 tons cracked.
40 " crushed—2,500 lbs., 1 inch area.

No. 14. Petersen's San Jose Pressed Brick.
4x7¼x2⅜ = 29 inches area.
15 tons cracked.
30 " badly cracked.
40 " crushed—2,758⅝ lbs., 1 inch area.

No. 15. Chicago Pressed Brick. 20 inches area.
20 tons cracked.
40 " crushing.
60 " crushed—6,000 lbs., 1 inch area.

No. 16. Salmon Brick (pressed).
4x8½x2½ = say 31 inches area.
10 tons cracked.
35 " crushed—2,258 lbs., 1 inch area.

No. 17. Gladding, McBean & Co.'s Hollow Brick.
4½x8x4 = 32 inches area.
Crushed at 2½ tons—156 lbs., 1 inch area.
Cracked at about 1 ton's pressure.
Splitting lengthwise. (Surfaces very much in wind.)

In all cases the splitting commenced at the top of the blocks, and worse to the left side of the blocks, indicating a bad adjustment of the apparatus. The surfaces of the ram and the contra block were not smooth, especially the latter, being rusty and very rough, and making a very irregular impression in the lead plates and pine boards. This fact would have to be taken into account in judgment of the respective values of the above experiments. In the stone blocks, too, it was not possible to have the surfaces crushed parallel with natural bed in all cases, the bed being in nearly all cases perpendicular to the line of pressure, the blocks and bricks in nearly all cases splitting lengthwise, and bulging up on top (rarely on bottom) and spalting. One small San Jose block crushed on natural bed at the high figure of 9,312½ pounds per square inch of area, being a block 4 inches square and 3⅛ inches thick.

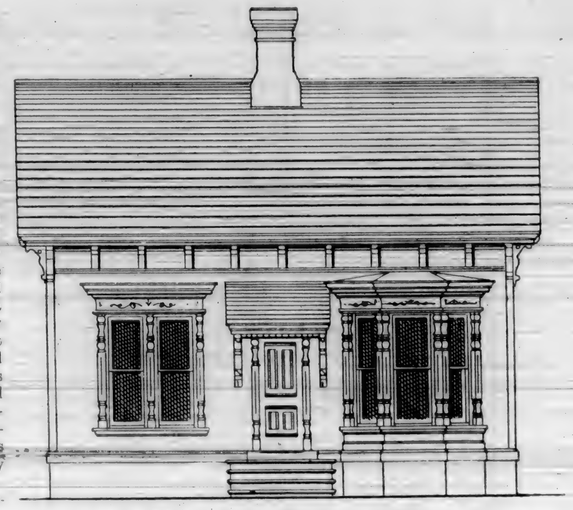
A Closet Shelf.

If there is anything that adds to one's comfort in an emergency, it is a closet shelf prepared for emergencies. That is clear. Accidents, nervousness, sudden pain, midnight calls for help, parcels that want doing up, broken crockery or ornaments, all find a ready answer to their calls on this carefully prepared shelf. It is so easy to prepare and keep in order, can be small or large, as one decides to confine its contents to a few things or enlarge to many. I intend to give a list for the smallest one that I think it advisable for any one to keep, be she keeping house or boarding. First of all come the things that are to be ready for illness, sudden or otherwise,—camphor, for faintness, headache, or a sudden attack of diarrhœa, although, for the latter, there is nothing equal to a tablespoonful of raw flour in a glass of cold water, to be taken in two doses half an hour apart. A closely covered little box of raw flour is easily kept on the shelf, to be often renewed, lest it get musty. A small tin can of flour and mustard, mixed in equal parts, ready to make into a paste for a mustard plaster, is to me a pleasanter arrangement for a hastily required mustard plaster than the "mustard leaves" ready at the drug stores. In a little box beside this can should be old linen and cotton rags, for the other half of the plaster, as well as for cuts or bruises; also a strip of flannel a "finger" broad and three-quarters of a yard long, to put upon the outside of a cotton cloth, several times folded and wet in cold water, for a compress for a sore throat. Keep your case of court plaster in this box of rags, and a spool of white linen thread, both conveniently near the necessary pair of small scissors.

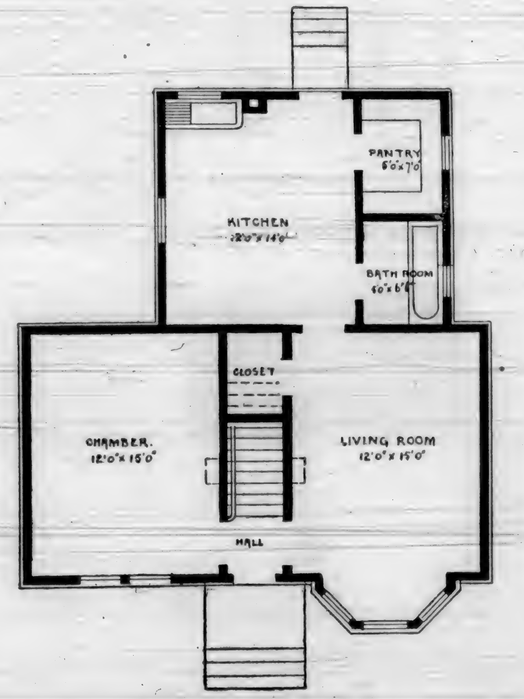
Camphorated oil, which is best when made at home by dissolving camphor gum in warm olive oil until no more will dissolve, is invaluable for sore throats and chests, or a cold on the lungs. Rub in well, and there will be no cold taken afterwards, as there is after the old-fashioned "goose grease." Vaseline is good for this purpose also, as well as for many others that every one knows about. There is nothing, for chapped hands, equal to glycerine and tincture of hydrastis, fifteen drops of the latter to an ounce of glycerine. Wash the hands in warm water thoroughly, and, before wiping, rub in a little or good deal of the mixture, according to the need.

Tannin, a dry, greenish powder, is a great comfort where a sudden severe nose-bleed occurs in the family. Once snuffing it up well into the nostrils generally ends the trouble. Tannin forms, with water, a good gargle for a sore throat, as it is a healthy astringent. It is the best thing I know of for severe chafing, especially for infants. The effect is almost magical. Pond's extract of hamamelis is another indispensable for this emergency shelf. It is really good for nearly all the ills mentioned on the wrapper of the bottle. An excellent way to get hamamelis is by the quart, and it is the cheaper way. On principle, my emergency shelf always holds olive oil, alcohol, and ammonia. Hot summer days, and headaches, find me grateful for my bay rum bottle. I quite forgot to put arnica in my remedy list, although it is decidedly second to tincture of calendula for cuts or wounds. Both are to be diluted with water when used.

It is very pleasant to turn from the above list and point you to my "Perfect" mucilage bottle; that is its commercial name, and well deserved. How many times you will use it if convenient on its shelf. Next it should stand a bottle of stratena, or one of its relations in the cement family. If Clytie's head comes off, or the butter dish cover breaks in two, or your favorite china cup gets into so many bits that it will only do for an ornament after a vigorous use of the cement, you will be glad of the remedy. A bottle of shoe polish, or box of shoe paste, is a handy thing when one dresses in a hurry. Last, but not least, comes a ball of twine. If you are fortunate enough to possess a silk bag, with pretty ribbons and pair of scissors, to hold your string ball, it is delightful. Otherwise, a ball on the end of the emergency shelf will save much hunting for string, and much vexation of spirit.



Front Elevation of a One or One-and-a-Half-Story Cottage.



Plan for above Elevation.

It Didn't Work.

When the employes in an Indiana furniture factory, operated by a German, struck for eight hours a day, he granted it; but when they wanted ten hours' pay for eight hours' work, he called them up and said:—

"My frens, maype I do ash you like. I haf an order from Shegago for ten dozen shairs. I vill sheep him eight dozen, und bill him for ten. If he doan't kick on me, it shows me dot der rule vorks both ways und we vhas all right."

It is needless to add that the idea didn't work; and that his men are receiving eight hours' pay.

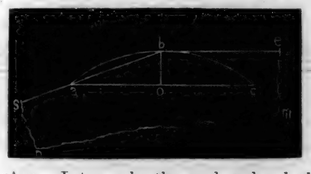
First Floor Plan City Dwelling.

A Practical Way to Describe the Arc of a Circle too Large for a Pair of Dividers.



Ans.—Let *a c* be the cord, and *o b* the height of the required arc, as laid down *on the drawing*. On a separate piece of paper, *s e m n*, draw *a c*, *o b*, and *a b*, also *b e* parallel to the cord *a c*. It is well to make *b s* and *b e* a little longer than *a b*. Then cut off the paper carefully along the lines *s b* and *b e*, so as to leave remaining only the strip *s a b e m n*. Now if the straight sides *s b* and *b e* be applied to the drawing so that any parts of them shall touch at the same time the points *a* and *b*, or *b* and *c*, the point *b* on the strip will be in the circumference of the arc, and may be pricked off. Thus any number of points in the arc may be found, and afterwards united to form the curve.

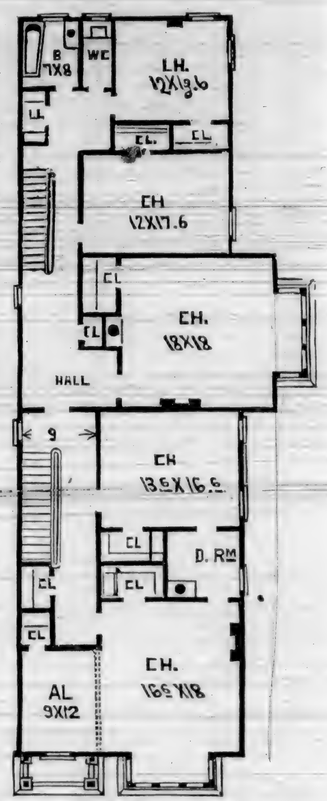
Plans for a City Residence.

The accompanying plans were adopted by a gentleman in this city whose principal design seemed to be the comfort of his family, with due regard to modern conveniences. He evidently found favor with the rule, "We must begin by observing what has already pleased, if we wish to judge rightly as to what will please in any future production."

The first floor contains a large parlor, connected with a library by sliding doors. In close proximity is a spacious dining-room, with place for sideboard, and an ample butler's pantry, with sink, lockers, cupboard, shelves, etc. The pantry is in direct communication with the kitchen, a large, well-lighted, and ventilated room. From the kitchen access is easily gained to the basement by means of the rear stairs shown, and also to the yard, and to a comfortable servant's bedroom.

The second floor contains five good-sized bedrooms, all amply supplied with closets. Special pains has been taken in the plans shown to have a place for each and every article of furniture necessary to a bedroom. It will be noticed that in each of the upper and lower halls there is shown a door, placed so that all draughts can be shut off between the front and rear stairs. No cornices are shown, these being left to the consideration of those who desire to use, as a model, the plans shown in our engravings.

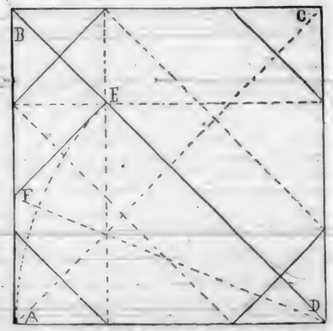


Second-Floor Plan City Dwelling.

Earthquakes.

In view of the wholesale destruction of property, coupled with loss of life, wrought by the recent earthquake at Charleston, South Carolina, the movement of which was felt from the Atlantic to the Mississippi, it seems proper to raise the question, whether we are to assume that a recurrence of the calamity is improbable, or are to adopt a method of construction in our larger buildings which will withstand similar strain. The Mexican and South American States are frequent sufferers from this cause; the Pacific Coast is subject to shocks of greater or less severity; and, though Charleston has not experienced a severe shock since 1811, it is not at all improbable that a like disaster may occur within the next twenty years. It would certainly be the part of wisdom for the city of Charleston, while reconstructing her shattered buildings, to seek a measurable security from future demolition, at the expense of an increased expenditure in construction. The havoc that would be worked in any of our Northern cities by a similar shock, may well be imagined by one familiar with the method frequently employed in the erection of structures for commercial and manufacturing purposes. To place a roof on four walls of brick or stone, built to a height of from three to eight stories, without cross walls and lateral bracing in exterior walls, is an invitation to ruin by earthquake or by fire. If Americans are building for the pleasure of seeing their work tumble in before fire or earthquake, too many have hit on the proper construction to insure this result. If we are building that our work may outlast this generation and the ones hereafter, we need to inaugurate a new era, in which the skin-builder shall starve for the lack of a job.—*Inland Architect.*

Dr. E. Parmley Brown says that the excessive use of common salt is one of the main factors in the destruction of human teeth.



To find the sides of an eight-sided polygon, draw the square A B O and D, and join D B. From D as a center, with D A as a radius, describe an arc, cutting D B in E. Then E B equals the side of polygon, and E F D equals the angle to mitre the sides.

By the use of the square to mitre the sides, place the square with E D on the blade, and E B on the tongue; mark from the latter for the angle required.

By calculation—let E D equal 18x18 inches, equal 324 plus 324 inches, equal 648 inches, square root of which is 25.4558 inches, minus 18 inches, equals 7.4558 inches, or 7 and 7-16ths inches equal E B.

By proportion—7.4558 inches : : 18 inches : 7.5 inches; 7.5x18 inches equal 135 inches; divided by 7.4558 inches equal 18.1067 inches, or 18 and 3-32d inches equal E D.

Christmas Presents to Mechanics.

We have on hand the largest assortment of mechanical and scientific works to be found in California. These we are determined to close out, as by the beginning of the year, a new management will assume control of this Journal. We publish below a list of works now on hand, with the publisher's price. TO ALL PURCHASERS WE WILL ALLOW A DISCOUNT OF FIFTEEN PER CENT. Select any work from the list. DEDUCT ONE-SEVENTH OF THE PRICE. Forward the money to this office, and by return mail you will receive the book.

WIVES OF MECHANICS SHOULD ORDER SOME OF THE ABOVE FOR PRESENTS TO THEIR HUSBANDS.

NOTICE PARTICULARLY OUR OFFER. Select any number of Books from list; DEDUCT ONE-SEVENTH of the Price; forward the money to this office, and the books will be sent by return mail.

Remember also that until January 15, 1887, we will forward any book printed at the same reduction, provided any one of above books is contained in order.

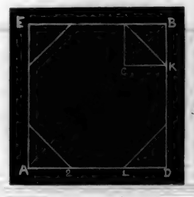
Back Bound Volumes of this Journal from 1880 to 1885 will be sent to any address, upon receipt of TWO DOLLARS.

We pay postage on all books ordered from this office.

A COUNTRY VILLA.

LATH do not make a very good showing, it is said, on the average dealer's books. There is no profit in them. The handling costs too much in proportion to the quantity and value of the stock turned over. Practically there is as much labor expended in moving a bundle of lath as there is a bunch of shingles, which is worth several times as much. No one ever saw a lumber-shover wrestling with more than one bundle of lath at a time, and though it is a small load, he makes out that it shall be a full one. The margin of twenty-five to thirty-five cents which there is in this item for the dealer, does not cover the expense of handling them through the yard, and in consequence the lath account usually shows a balance on the wrong side. But yards must keep them, whether they pay or not. They are like a good many of the small notions that many kinds of retail merchants are obliged to handle; there is no money in them, but they must be kept and sold just the same, because the buyer demands that he shall be accommodated to that extent.—*Ed.*

How to Lay off an Octagon.



IF the timber is not square, mark off the largest square that can be formed. Draw a line from corner to corner, as A B. Mark the distance of one side of the square, as A D, on the diagonal A B, at C. Draw C K parallel to E B. Set a gauge to B K, and run this distance on all four sides of the square. Work off the corners, and a perfect octagon will be formed.

New Motion to a Grindstone.

AN improvement in the driving of grinding stones and emery wheels is that by which the wheel is given a reciprocating lateral motion in addition to its rotation. Every one has noticed the advantage of moving a tool from side to side on a hand grindstone so as to equalize the attrition on the different parts of the edge. It is found that by making the grindstone move and keeping the tool still a more perfect result is attained, while the detached particles of steel have an opportunity to drop off the grindstone instead of being crushed into it, and the wear of the stone and the heating of the tool are both greatly diminished.

A Country Villa.

THE elevation and plans here presented will convey to those intending to build an idea of how a comfortable, picturesque building should be erected. We are prepared to furnish the plans for this or any other kind of a dwelling in any part of California.

A CONSIDERATION in the use of stone for important buildings is that of having it quarried, stored, and seasoned for some time before being hewn and placed in the walls. By these means the natural sap is allowed to evaporate, and the stone tested as to its quality. This would add to the cost, but the money would be well spent if this precaution prevented the wasting of stones from the rains, frosts, or atmospheric influences, which, especially in our cities, soon act on the surface of a newly quarried stone. Stone that is quarried one day and built the next is in a green state, and unfit for use. It is not in condition—it is at its weakest—its pores are open and ready to absorb not only moisture, but the gaseous and disfiguring influences which tend to its destruction. Every hewer knows that to get a polish on a stone that has lain for some time is very different from what he gets on one fresh from the quarry, and this of itself should be sufficient to warrant the precaution recommended, which is to thoroughly season the stone before using it.

An Octagon by the Use of the Square.

ALONG the face of the "tongue" will be noticed two parallel lines, with a row of dots interspersed with figures, between them. The figures simply show that the dots are numbered by tens. This is known as the "eight square," or octagonal scale. This scale is based upon the fact that each face of a regular octagonal scale is almost exactly five-twelfths of its shortest diameter.

In using the scale, the timber is first squared to the diameter desired for the octagon, and a line drawn from the center of each face to the center of the opposite face; then, with the dividers, as many spaces of the scale are taken as there are inches in the diameter of the timber, and the distance thus obtained is set off each way from the center line upon each face, which gives the position of the angles of the octagon.

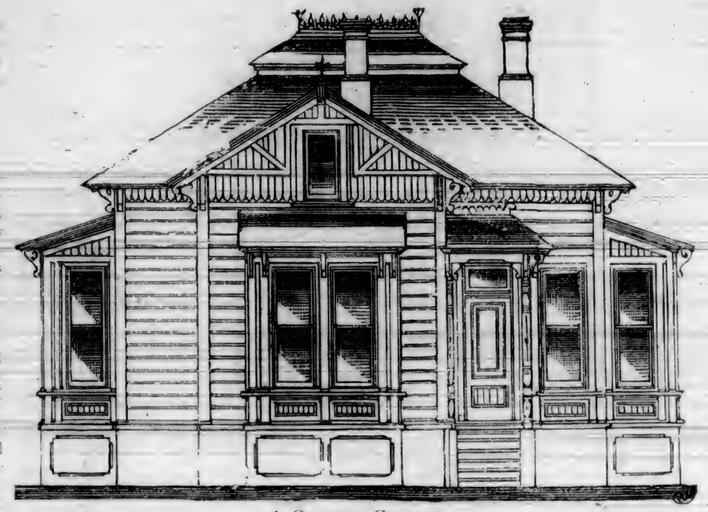
For instance: let A B C D be the square end of a stick of timber six inches on a side. Draw the center lines A B and C D from the center of the faces A and C. Now with the dividers take from the scale 6 spaces, and lay off this space on each side from the center of each; as A 1, A 8, D 2, D 3, B 4, B 5, C 6, C 7; join by a line the points 1 2, also 3 4, 5 6, and 7 8; and you have the outline of the largest octagon stick that can be cut from this piece of timber.

THE United States is the only country in the world which spends more for schools than for military and naval armament. It spends about $93,000,000 for education and $47,000,000 for war. It spends for education nearly three times as much as Great Britain, three times as much as Germany, and six times as much as France.

A PIECE of iron rolled in the new Falcon Mills at Niles the other day is as thin as a sheet of ordinary paper. It would take 150 sheets to constitute one inch in thickness. The mill made this piece just to see how thin they could roll.

A Country Cottage.

THE accompanying plan will suggest a few ideas to those seeking for the elevation of a country cottage, who desire beauty combined with distinctive features, at a low cost.

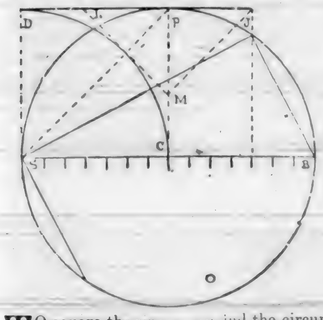


A COUNTRY COTTAGE.

Priming for Wood, Paper, Lime, or Hard Plaster Walls.

A SUPERIOR priming for these purposes, which, it is claimed by the inventor, Herr Kall, of Heidelburg, is cheaper than linseed oil, and closes the pores so perfectly that less paint is required than with oil and red lead. Priming coat is thus described: The substitute used for boiled oil consists of ten parts of boiled blood, as furnished by the slaughter-houses, with one part of air-slacked lime sifted into it through a fine sieve. The two having been well mixed are left standing for twenty-four hours. The scum that collects on top is cleared off, and the solid portion is broken off from the lime at the bottom; the latter is stirred up with water, left to settle, and the water poured off after the lime has settled. The clear liquid is well mixed up with the solid substance before mentioned. The mass is left standing for ten or twelve days, after which a solution of potash permanganate is added, which decolorizes it and prevents putrefaction. The mixture is then stirred up, diluted with more water to give it the consistence of very thin size, filtered, and then a few drops of oil of lavender added. The preparation, if preserved in closed vessels, keeps a long time without change. A single coat will suffice for priming.

How to Square a Circle.



TO square the circle is to find the circumference when the radius is given, and for effecting this it is necessary to know the ratio of the diameter to the circumference.

To find the circumference when the radius is given geometrically:—

FIG. 1.—Let C S equal the radius; from the points C and S as centers, describe the circle and arc C D; tangent to the arc and circle draw D P. Join S P; at right angles to S P draw L M tangent to the arc D C, and M J equal M L parallel to S P. Then D J equals one-fourth ($\frac{1}{4}$) of the circumference of the circle, and S J equals the side of a square equal in area to the area of the circle.

To find the ratio of the diameter to the circumference:—

Divide S B, the diameter, into fourteen equal parts, eleven of the parts equal D J or one-fourth of the circumference, multiplied by four equals forty-four, divided by two equals twenty-two; fourteen divided by two equals seven; equal to seven twenty-seconds, the ratio required.

The Law as to Party Walls.

A PARTY wall is the wall dividing lands of different proprietors, used in common for the support of structures on both sides. At common law an owner who erects a wall for his own buildings which is capable of being used by an adjoining proprietor, cannot compel such proprietor, when he shall build next to it, to pay for any portion of the cost of such wall. On the other hand, the adjoining proprietor has no right to make any use of such wall without consent of the owner, and the consequences may be the erection of two walls side by side, when one would answer all purposes. This convenience is often secured by an agreement to erect a wall for common use, one-half on each other's land, the parties to divide the expense; if only one is to build at the time, he gets a return from the other party of half of what it costs him. Under such an agreement, each has an easement in the land of the other while the wall stands, and this accompanies the title in sales and descent. But if the wall is destroyed by decay or accident, the easement is gone, unless by a deed such contingency is provided for. Repairs to party walls are to be borne equally, but if one has occasion to strengthen or improve them for a more extensive building than was at first contemplated, he cannot compel the other to divide the expense with him. In some States there are statutes regulating the rights in party walls, and one may undoubtedly acquire rights by prescription on a wall built by another, which he has long been allowed to use for the support of his own structure.

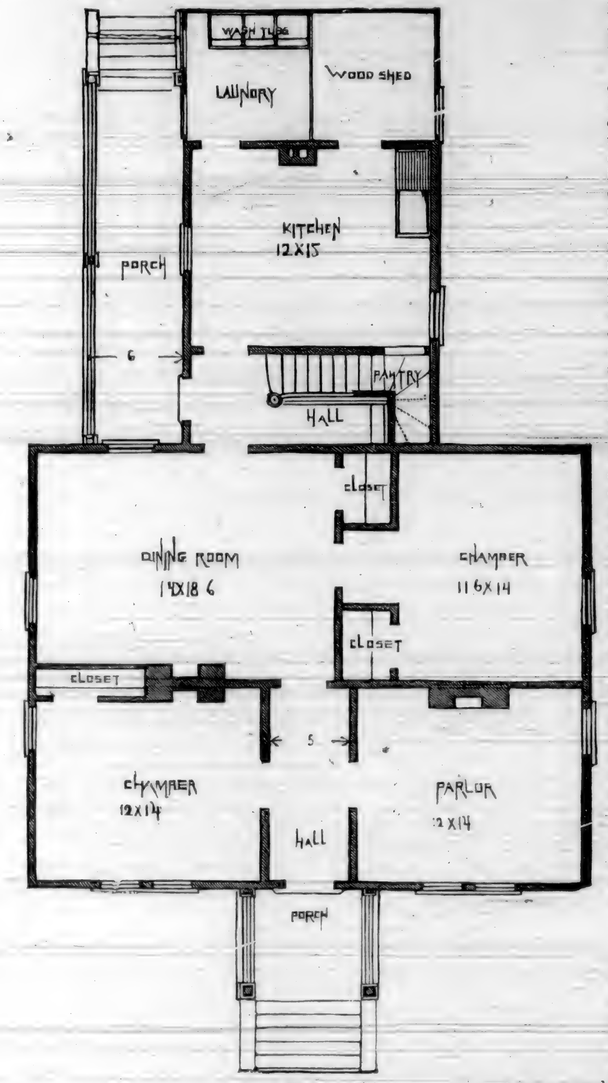
A PLUMBER was sent to the house of a wealthy stock-broker to execute some repairs. He was taken by the butler into the dining-room, and was beginning his work, when the lady of the house entered. "John," said she, with a conspicuous glance toward the plumber, "remove the silver from the sideboard and lock it up at once." But the man of lead was in nowise disconcerted. "Tom," said he to his apprentice, who accompanied him, "take my watch and my chain, and these coppers, home to my wife at once. There seems to be dishonest people about this house."

BUSINESS MANAGER OF ARCHITECT: What is the rule for finding the length of braces between two posts, when they incline one foot in six feet rise?

The cut represents a frame, the posts of which incline one foot in six feet rise. Let the distance B B represent seven feet. The braces are run at an angle of 45°. The post inclining one foot in six, leaves the distance at A A six feet. We have given the rule in a previous number. In this case the brace would be 8 ft. 5 13-16 inches.

Permanent and Unwashable Colors on Walls.

A METHOD of applying paint to a wall so as to secure the greatest possible permanency, is to have the wall coated with mortar composed of lime and sand, and to throw over it a very weak wash of water with which potash silicate is mixed; then proceed to paint, and syringe the surface with a strong solution of the potash silicate. There are, however, a number of colors to be avoided in this process, among which are cadmium yellow, Naples yellow, baryta chromate, chrome-red, ultramarine, cobalt blue and green, chrome green, ivory black; also lime carbonate, baryta white, and zinc white, as the alkali would injure some of these and destroy others. The pigments should be mixed with potash silicate. The latter should be applied warm on the painted surface.



A CHEAP COUNTRY HOME.

A Cheap Country Home.

THE above plans are self-explanatory, every room and its dimensions being plainly and accurately marked.

IN acquiring Burmah, England has got possession of vast forests of teak, which, never plentiful in India, was becoming commercially very rare. Of all the woods grown in the East this is the most valuable. It is neither too heavy nor too hard; it does not warp or split under exposure to heat and dampness; it contains an essential oil which prevents its rotting under wet conditions, and, at the same time, acts as a preservative to iron and repels the destructive white ants; it is, withal, a handsome wood, of several varieties of color and grain, and takes a good polish.

THE beautiful embroidery upon linen and muslin which is sold in this country as "French" embroidery is made by the poor peasants of Ireland, who are able to earn at it about sixty-two and one-half to seventy-five cents a week—working twelve to fourteen hours a day.

Does Charring Timber Promote Durability?

THE general belief has long been that it does, and in accordance with this conviction the practice has been widely followed. But a contrary view of the subject is taken by *Wood and Iron*. That journal says in a recent issue: "As charcoal would endure for ages in places where timber would decay speedily, the practice of charring the surface of fence posts and other timber has been repeatedly recommended in books and ephemeral publications, as eminently worthy of universal adoption.

"The theory upon which such a recommendation is based would seem to warrant a confident expectation of satisfactory results in practice; but repeated experiments with charred timber have furnished conclusive assurance that the process will not promote its durability. Indeed, numerous experiments have shown that charring promotes premature decay. Two posts split from the same log may be set side by side in the ground, the surface of one being charred and the other not; and it will be seen that the charred post will perish before the other.

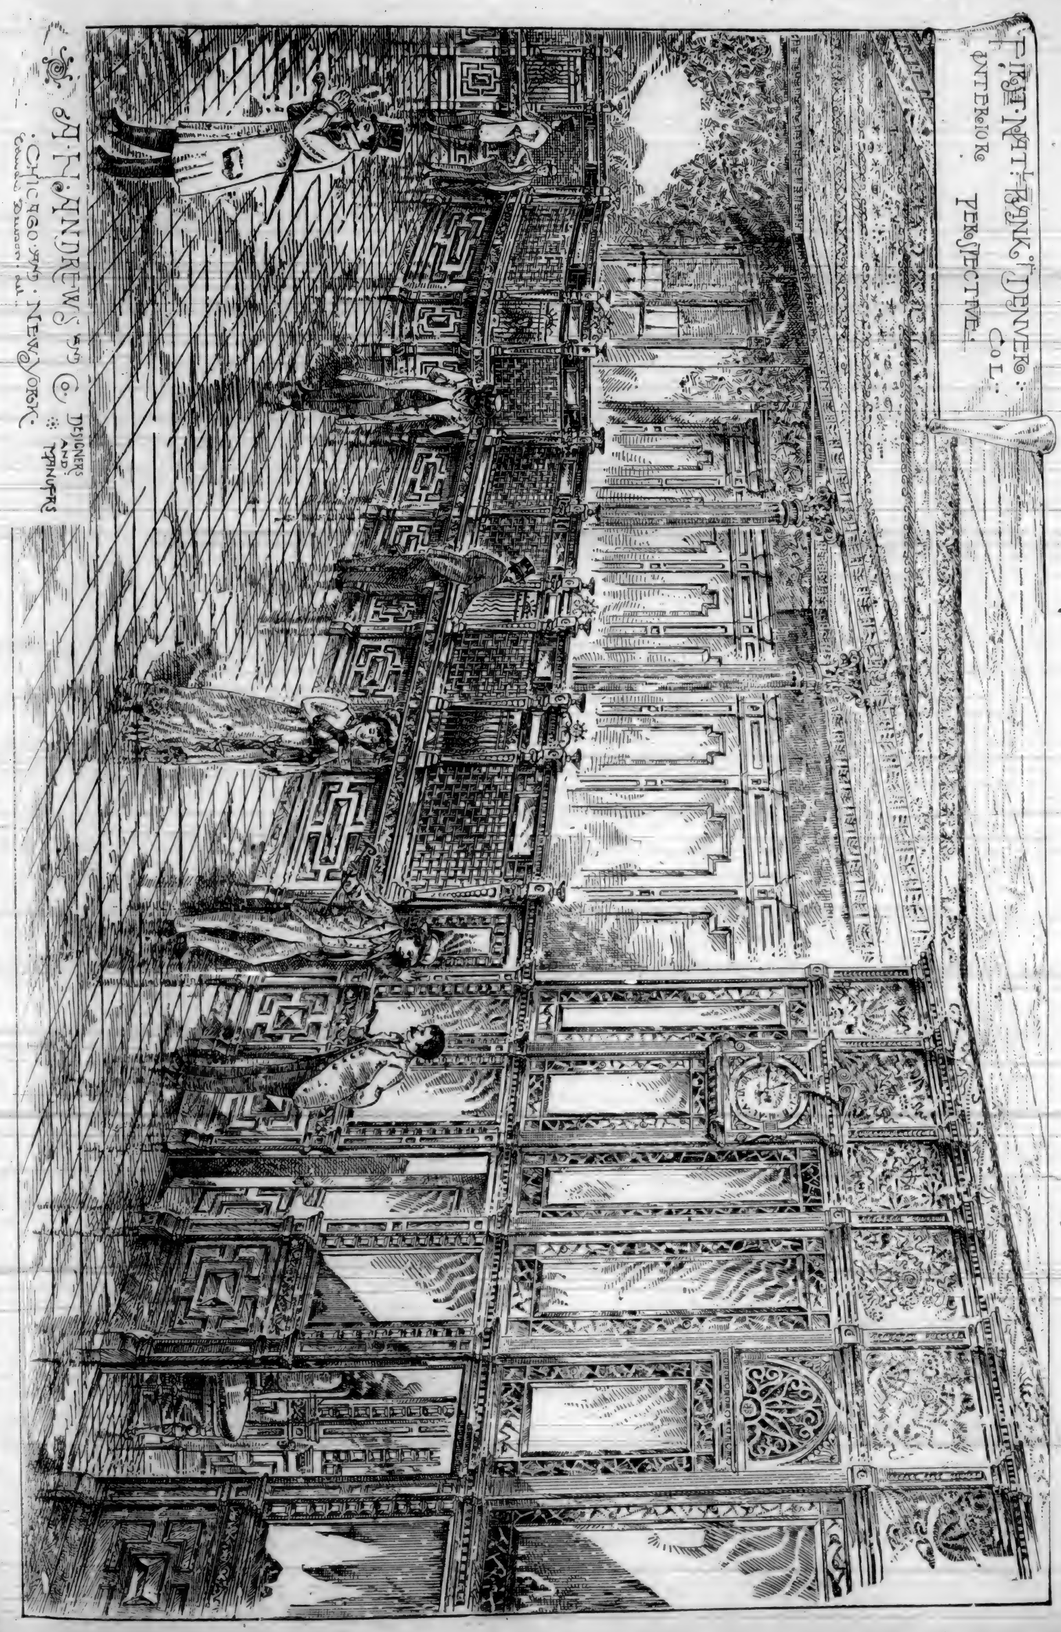
"The same is true of railroad ties, and all such timber as may be exposed to the altering influences of wet and heat. Could the entire timber be changed from its perishable condition to one solid piece of charcoal, the durability would be promoted to a surprising length of time; but the strength of the material would be destroyed. When fence posts or other sticks of timber are exposed to the rapid action of wet and heat, the surface will decay first. One might suppose, therefore, that when timber is enveloped by a layer of charcoal, the durability of the entire piece would be greatly promoted. And such would be the case were it not for the fact that the charcoal is not impervious to water; and as water reaches the timber below the charred surface, decay will commence soon after the grain of the wood has been exposed to the influences of the weather. When the change has once begun beneath the charred surface, the durable covering of coal will be of no service whatever in preserving any portion of the wood. Taking this practical view of the subject, it will be perceived that if only half an inch of the outside of a post be charred, the post will not endure so long as if the same thickness of wood has been left uncharred, to waste away by slow decay."

TWO OF the largest castings in the world are to be seen at Nara and Kamakura, Japan, the one at the latter place being 47 feet high, and the other, at Nara, being 53½ feet from the base to the crown of its head. The statue at Nara is supposed to have been erected in the eighth century, but it was destroyed and recast about 700 years since. In endeavoring to recast it several mishaps occurred, and when at last success came, some few thousand tons of charcoal had been used. The casting, which is an alloy of iron, gold, tin, and copper, is estimated to weigh 450 tons.

A SOUTHERN writer furnishes this bit of history. The first doors of St. Peter's Church at Rome were made of cypress. They gave way to the bronze doors after being in use 100 years, and are as sound as when placed in the building. The boxes in which mummies are found are made of this imperishable wood.

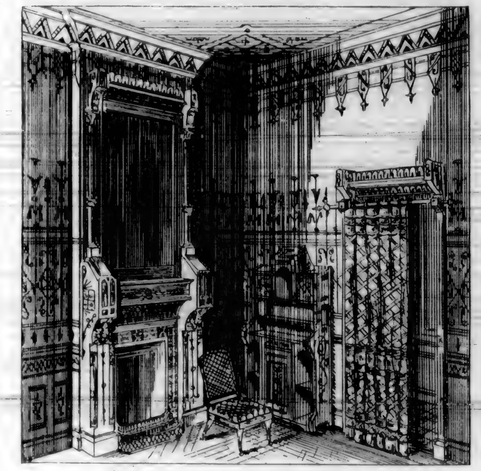
ALL the cannon foundries of Europe are overrun with orders and working day and night. While they make guns abroad, we make plows and work to raise the food that must support the luxury of war.

Notice Our Holiday Offer on Page 161.



ART AND ARCHITECTURE.

[Special for this Journal. By F. HILLER, Architect and Mechanical Engineer.]



XXXIV. GRADES OF DEVELOPMENT IN ART.

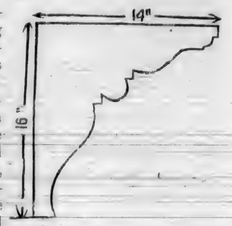
THE figure three has evidently a privileged signification in all relation of men and of nature. Was to be and to pass away. Beginning, middle, and end designate simple forms of those relations whose changes, expansions, and exaggerations are easy, as if self-evident seen, so that here only may be remembered, that in the religions of nations being more capable of civilization, or of people more advanced, Trinity appears on the main in Lens, Poseidon, and Hades in the India; Trinity in Brahma, Siva, and Vishnu, up to the undivided Trinity of the Christian church. This third partition is also, in the development of the arts, of the largest signification, and her close observation makes amazingly more easy the comprehension of the works of art. Germinate, green, and fade are here also the three kinds of appearances, which show themselves and are recognized as the front step, the flourishing and the declining decaying.

XXXV. FRONT STEP.

By the observation of the spirit of a work of art was the sense, purport, and the form of the same drawn in closer perception, and regard, and set up, the perfect harmony of both leading to the highest beauty. But before man arrived to the same with his work, generations must toil and trouble hundreds and thousands of years to prepare the means for him, that he can find a truly worthy sense and purport, to possess a full comprehension of form, and to overcome all hindrances and obstacles successfully in forming the same.

In the petty insignificant beginnings of art the crude predominated first, and the struggle with the resisting material and with his own unskillfulness. And even then the human heart just then desired at this grade of culture a visible representation of the most difficult, "divinity." Already many times it has been stated before, that such a desire leads to symbolizing; that is, to a kind of representation, by which something not lying directly in the form should be indicated by the same or certain other signs. She is called the symbolic grade, or, also, since she always desired to bring up a divine holy spirit, the hieratic symbolic grade. She embraces the art of all barbarous people, those of the Greek to Peadias and his time, and of the Christian nations up to Raphael and his time. She also embraces a great and powerful time and an unmeasurable treasure of works of art and monuments.

The only particular characteristic of all works of this fore grade is, that the spirit overreached the form; that is, that the technical means for its representations were insufficient, and, therefore, partly, as if it were, had to be guessed at. The master of such works thought deeper and felt keener, as he was able to express, finding the only fitting form insufficient there remained some of that, which he intended to put in his work, back, which could not be brought direct to view and appearance, but anyway so that it was not altogether without an indication.



If in the fore grade of art of a people sets in a standstill of a long duration in the general development, then the imperfect forms gradually lose their original symbolic expression, and they transmit themselves from generation to generation as unchangeable types, so that its duration and stability by custom, agreement, and conventionalism become unimpeachable. She herself became external, conventional, rigid, and deadening. Large periods of barbaric people, as the Egyptians, Assyrians, Indians, the last hundreds of years of the Byzantines, have such conventionality, which originally was symbolic art. But if there is no standstill, but a lively progressive development, as in the art of the middle ages of the Western Christianity, then the symbolic works gain a special esthetic force. Then the one who is capable of penetrating and comprehending the defective and less perfect forms, will learn to listen and watch for that which the master could not express. Such works impart the attractions, charm, and the honest industry, the true love, the originality of thought, and the intensity of feeling richly reward the trouble which must be expended to solve the difficulty of her form. The first manly efforts which they attest are exceedingly interesting, even if the first crude beginnings are darkly veiled and hid, as the helpful ways of a child with its thousand slumbering germs for development, which gradually plainer and clearly come out. But not only the conscious effort alone recompenses for the fault in the perfection of the form. It is the impartiality and naturality, the amiable modesty, and the fresh boldness, which draw and lead us again with love to the works of a young and rejuvenated humanity. Even the works of barbaric nations, which fall and show the grotesque and distorted, are tokens of remembrance estimable and venerable, of the strife and struggle of young original generations, when even if the work itself does not give us pleasure and satisfaction.

XXXVI. FLOURISHING PERIOD.

When man at last has succeeded to obtain the full cleverness and security in the making of forms, and has learned to comprehend that he only can make objects which he understands, but not supernaturally divine, but naturally human things, then is the time not far off for the real flo rishing period. Then such cleverness and understanding are for once the closing end of a long time of preparation, and secondly, are they the signs of the

height of a general historical culture, a striving after knowledge, a craving after liberty, and those conditions are the times of birth of great artistic genius. In full equilibrium and noble harmony set itself in the works of the same, the spiritual and the bodily. Meaning and form correspond perfectly to each

other, and a pure beauty displays itself before the amazed eyes of our own time and the admiring posterity. Here is nothing symbolic, nothing which lived in the soul of the artist was perceived, and did not obtain expression, and was made visible. In no line, in no motion, is something which has not directly a spiritual signification and expression. Nowhere is a too much or a too little; everywhere is complete conformity with which the spiritual lives in the appearance, and the form finds its signification and meaning.

As in the highest sense only one beauty exists, we would probably conclude that the highest works of art could only be of one kind. This is not so, since we have not to deal with absolute beauty, but only with beauty, made and produced by men, by defective men with infirmities and passions, which is frequently conditioned, not only by the material used for the work of art, but also by the influence of the time of creating, as has already been mentioned, but also by other conditions, to which the perception and the manner of the technical execution chiefly belongs. The conditions of the beautiful are, however, by no means to be taken as one-sided, or to be so comprehended, that a Madonna by Durr could be reproduced in a Raphaelic manner of drawing. They act rather uniformly and jointly and together on the spiritual and the formal, so that the master could not take the idea otherwise than with the full consideration of the former. In a work of art is the intimate belonging together, the unconditioned inseparability, so that nothing in the form can be changed without altering the idea and to the same nothing added or taken therefrom without altering and transforming of the form.

The duration of such an art period will depend, if the same is solely founded on single individuality, or if the same is directly upheld and carried by the whole people. In the former instance, and if the single individualities are, in the fullest measure, children of their time, she will die with the individuals, as it happened in Italy; but, in the latter case, she can last hundreds of years, even if for once she shines brighter; at other times in the shadow of troubled events is dangerously threatened, as the Greek art shows us a bright example.

IN a late number of the *Gazette des Architectes* is an interesting account of a controversy between the Paris Omnibus Company and a M. Ezebeck, whose premises at Auteuil adjoin a stable belonging to the omnibus company. In order to economize in the cost of the ground, which is very high in this locality, the company has arranged its stable in two stories, and has stalled a portion of its 580 horses on what we would call the second floor, on a level with the sleeping-rooms in M. Ezebeck's tenements adjacent. On this reverberating floor, and the inclined plane by which the horses ascend and descend at all hours of the day and night, their heavy tramping creates an intolerable and never-ceasing jar and turmoil which so greatly disturb M. Ezebeck's tenants, that some of them have entered suit against him for pecuniary damages, and others threaten various methods of obtaining redress, while those who are not constrained by leaseholds have moved out. All this damage, he claims, is owing to the proximity of the stable, and for several years past he has been endeavoring to compel the omnibus company to modify its stable in such a way as to abate the nuisance. To this the company has already consented, and on the advice of an expert, it constructed an additional wall between its stable and M. Ezebeck's premises at an expense of 50,000 francs, which it was hoped would abate the annoyance. Unfortunately, this wall entirely failed of its purpose, and M. Ezebeck has applied to another expert, Architect M. Gelis Didot, whose report is printed in full by the *Gazette*.

M. Didot's explanation of the failure of the wall already built to interrupt the transmission of noise and jar from the stable to the tenements, and his advice as to the proper remedy, are interesting and suggestive, while his communication is such a model of clearness and conciseness that we regret our inability to print it entire. Briefly resuming, he ascribes the failure of this intercepting wall chiefly to the fact that it stands upon the same footing as the original stable wall, and that through this footing all jar and vibration produced in the stable wall are transmitted practically undiminished to the new wall and thence to M. Ezebeck's premises. The new wall is thus practically one with the old one as to the noise and shock complained of. He also finds the distance of this new wall from the old one, namely, ten centimeters, altogether too slight. M. Didot recommends that a new wall be constructed at a distance of two to five meters from the stable wall; that the new wall have a footing entirely separate from the stable footings; that it be sunk to a greater depth, and that the space between the walls be left open or filled with some non-conducting substance. He also suggests that the inclined ascend to the second floor might be removed to some part of the stable more remote from the tenements, and also that the horses be stalled in some other portion. Incidentally he mentions the precautions imposed on other noisy occupations, as that of gold-beating, printing, and numerous manufactures. Sometimes their machinery rests upon special foundations, built up from the ground wholly independent of the building itself, or upon columns rising from special foundations, or on rubber cushions. We may add that sand boxes are sometimes used for a like purpose. M. Didot's comparison between the stable and a gold-beater's shop is vivid and impressive. He says the former establishments, at the most, seldom have more than twenty hammers in operation, while in the stable, even if there are but eighty horses present at a time, the noise from their iron-shod hoofs on the reverberating floor would be equivalent to that of 320 gold-beaters' mallets, or sixteen times the noise from one gold-beating shop.

The Strongest Brick Walling.

A BRICK of average quality requires a pressure of from 600 to 2,000 pounds and upwards per square inch to crush it, the figures varying in different descriptions of bricks, and being as high as 4,395 pounds in hard-burnt facing bricks. Brick walls and brick piers, if properly built, will bear very heavy weights, as will be seen from these figures. The strength of a wall is not dependent, however, upon the strength of its brick alone, but upon three distinct conditions:- (1) the manner in which the bricks are arranged; (2) the strength of the mortar, and (3) the strength of the bricks. Each condition is of considerable moment, and, considering that brick-work is rarely weighed with a load even approaching one tithe of the crushing weight, it is obvious that the first and second conditions are of the greatest importance.

The object of mortar in a wall is simply to form an adhesive material between the bricks of which the wall is composed. It has no function beyond that. Good mortar is certainly not so strong as good brick, and the mortar joints should, therefore, be kept as thin as is consistent with the perfect adhesion of the bricks. The current custom of making thick mortar joints has the effect of considerably weakening the brick-work, and should be discouraged.

One of the strongest forms of bonding in brick walls, is that known as "English bond," in which the bricks are arranged in alternate courses of headers and stretchers. The small amount of cutting required, the avoidance of two vertical joints over one another, and the large number of headers in the wall render it very strong and suitable for heavy work; in fact, English bond, if properly carried out, conforms very nearly indeed, to all the requirements of good bonding.

In thick walls of heavy buildings, such as warehouses and structures of the same class, the strength of the bond may be improved, to some extent, by arranging every fourth course of bricks diagonally, forming what is sometimes termed "diagonal bond." The advantage is that a lap of four, instead of two inches, is obtained. The elevation of this bond is the same as that of ordinary English bond. The header courses are the ordinary header courses of English bond, arranged alternately with stretcher and diagonal courses. The diagonal courses are arranged alternately in opposite directions. One disadvantage of this arrangement of the bricks at an angle, is the fact of its leaving small triangular spaces on each side, which tend, to some extent, to weaken the wall. These spaces should, however, be carefully filled in with pieces of brick, and not be allowed to be left simply filled in with mortar.

THE output of a Swiss watchmaker is 40 watches a year; of a United States mechanic, 150; and the American earns in his skilled line of labor three times as much as his Swiss competitor.

TAKE any saw running constantly in one direction, and after having made 10,000,000 revolutions, examine its particles at a newly broken surface with a microscope, and it will be found that every molecule of iron composing that saw has been displaced.

THE total cost of the Riel Rebellion in the Northwest Territory was $4,700,000 and the casualties 26 killed and 206 wounded.

The Carpet Beetle.

THE rapid increase of these insects, and the great destruction of carpets and woolen clothes which they occasion, make it of importance that every housewife be informed as to their history, appearance, and the remedies for preventing and getting rid of the pests. The Zoological Department of the Agricultural College of Michigan has recently issued a very complete bulletin concerning these insects, from which we quote the following paragraphs:—

"The carpet beetle belongs to the family *Dermestidæ*, and is closely related to *Dermestes lardarius*, the bacon beetle, which thrives upon dried insects and other museum specimens, as well as most kinds of animal tissue. It is a minute but handsome beetle only one-eighth of an inch long, and about two-thirds as broad as long. The main color is black, while a dorsal red line extends longitudinally, bordering each wing-cover internally, and is marked by three projections on each wing-cover. Opposite these red projections on the outside of each wing-cover are three white spots. This handsome little pest will be found in concealed places from October till the following spring. As the beetle does not eat, no harm will be done by the insect while in this stage, except as in egg laying it prepares for future mischief.

"The larva—the real mischief maker—is about one-half longer than the beetle. It is ringed with light and darker brown bands, and the body is margined with tufts of brown hairs. These are very long at the ends of the body, and at the front obscure the head. Similar shorter hair clothes the whole body. The ringed and hairy character makes it easy to identify this larva.

"When the larva is fully developed, usually late in July and August, it seeks some concealed place, as the crevice between the boards of the floor, where it changes to a pupa. Sometime before the full change to the pupa is made, the larva skin breaks open. These pupæ, which will be seen from July to October, and even later, are quiet, and so of course do no damage while in this state.

"We see, then, that the injury from the carpet beetle comes through the larvæ, and is most marked in June, July, and August, when the larvæ are most numerous and abundant. The fact, however, that beetles are emerging from the pupa state from October till the following spring, together with the artificial conditions of heated rooms, will undoubtedly, as has been the case with the clothes and carpet moths, vary their habits in this respect, so that very likely in our rooms that are always kept warm, development may be hastened and the insect may become even double brooded, so that quite possibly we may find the larvæ feeding at all seasons.

"The fact of the rapid increase of these insects, and the terrible destructiveness which attends an onslaught by them, make it imperative that we find a remedy for this evil, or else abandon the luxury of carpets, not to speak of woolen garments. Cases are known where the insects have taken entire possession of houses from basement to garret, in a year or two's absence of the owner, and have destroyed or seriously injured all woolen belongings, even to the picture cords. Its small size, fearful destructiveness, and its power to resist insecticides make it a terrible pest; and wisdom urges that all learn to detect it so as to stamp it out upon its first arrival.

"Experience shows that it first attacks carpets, and there is where we may look for an assault. Like the well-known carpet moth, *Tinea tapetzella*, it works first and most at the borders of the carpet.

"I should recommend the ironing of wet cloths placed over the affected part of the carpet, using flat-irons that are very hot. The cloths may be two or three thicknesses of common toweling, wrung out of water just so they will not drip, then iron till dry. To secure the best results, one ought to have a dozen or more of irons. I have found that this, thoroughly done, is most deadly to the carpet moth larvæ, and surely the intensely heated steam penetrating every fiber of the carpet, and to every crevice of the floor, must sound the knell of every larval carpet beetle that feels its deadly presence. I have tried this on delicately tinted carpets, and while it was delightfully efficient in destroying insects, it did no injury whatever to the carpet. The only caution here, then, is to make thorough work; *be sure of a full head of steam!*"

THE privy vault, which for the most part cannot be dispensed with in localities which are not sewered, and have no regular water supply, is commanding considerable attention just now when sanitary surroundings are so much sought after. Various theories as to the best mode of construction are being advanced, proper regard being had for the safety of wells contiguous thereto, so as to guard against their pollution, and while each plan suggested from time to time may have its merits, it is worth while to consider one which was offered at the late Master Plumbers' National Convention, and which, from its simplicity and cleanliness, must commend itself to general approval. It was in treating the subject of "The Danger of the Privy Vault," in an essay prepared by a member of the Baltimore Master Plumbers' Association, that the best substitute for the common privy came up for consideration, when the following was offered: Instead of making under the privy seat, in country places, for instance, the usual excavation, the essayist recommends that there should be a strong, galvanized iron box made to fit under the seat into which everything could fall. The back or sides of the privy house should be so constructed that when full the box could be drawn out and emptied. Before being put in position, dry earth or ashes to the depth of about four inches should be placed in the bottom, and in the privy there should be a box, with either ashes or earth, a little to be sprinkled over the box, under the seat, whenever used. One effect of such an arrangement would be that the contents of the box would serve as a fertilizer, while the main object, that of keeping the air and the soil free from pollution, would be fully secured.

IN Ireland the total number of land-holders is 68,716, and of these 36,141 own less than one acre of ground.

In our December issue we will publish complete a list of those who are in arrears for subscriptions to this Journal. Avoid publicity by sending us the amount of your indebtedness immediately.

A BRIEF but forcible sermon is preached by the *Builder and Woodworker*, of New York, on the morality of home decoration. It argues that every improvement in the house is an improvement in morality. The efforts to acquire, to maintain, and to improve it are a daily, life-long schooling in morality. And in the train of these virtues, and akin to them, comes the sense of the beautiful. The house, the home, is one's own, is as potent as it is simple and unfailing in working these humanizing effects. We see evidences of this in what remains to us of the domestic architecture of the Middle Ages. Men then bestowed much thought on the designing and decoration of their houses, because they were their own.

Fire Hose and Carden Hose, W. T. Y. Schenck, 256 Market Street.

East side Narrow Gauge Depot. One-story brick. O., C. McKirnan; A., T. Lenzen; day work; cost, $6,000.

Hollister—Two-story brick. (Masonic Hall.) O., D. K. Sanford; A., Jacob Lenzen & Son; C., Jacob Dorn; cost, $8,500.

Seattle, W. T.—One-and-one-half-story frame. O., N. Toklas; A., P. R. Schmidt; $5,000.

Sausalito—Two-story frame. O., T. M. Curtan; A., Chas. I. Havens; C., A. Beyer; $4,750.

HILL'S PATENT INSIDE SLIDING WINDOW BLINDS

Are Adapted to Any Style of Window

And Suitable for all Buildings, Dwellings, Stores, Office Buildings, and for Houses Built to Rent, Hotels, Boarding or Lodging-Houses are Unexcelled.

THEY are entirely inside of the window casing, and while requiring no furring out or boxing, make it an impossibility to tear curtains, interfere with plants or window ornaments, or become broken by contact with chairs or other movable articles.

The light can be admitted and sunlight excluded from any part of the window; can be instantly removed and taken to any part of the house to clean, and as easily replaced.

They can be opened or closed with the window raised, and without removing articles from the window-sill, and cannot blow open or rattle. The Blind is very light (one-half inch in thickness) and strong, possessing more durable qualities than a hinged blind one inch in thickness.

There is NO SAGGING, BANGING, OR GETTING OUT OF ORDER!

They are made in three sections in height (each section sliding past the others), and any number of divisions in width corresponding to the folds in the old-fashioned folding blinds. They require NO HINGES—all trimmings furnished with blinds—are MADE OF ALL WOODS, finished or unfinished, and COST LESS than old-style folding blinds. They have been extensively used by the best architects and builders throughout the East and West, and have given perfect and entire satisfaction wherever introduced.

ENGLISH AND AMERICAN VENETIAN BLINDS (IMPROVED).

The only perfect Venetian Blind in the market. The Blinds can be seen at the Mechanics' Fair. Or for samples, prices, and further information, address as below.

The following are a few of the owners who have adopted the HILL BLIND in preference to any other:—

L. M. Fabry, c r. Hayes and Laguna; architects, Miller & Armitage. John MacKenzie, cor. Grove and Broderick; architect, H. D. Mitchel. H. F. Bruns, cor. Geary and Taylor; architect, John M. Curtis. THE CALIFORNIA ARCHITECT AND BUILDING NEWS.

VOLUME VII. ENTERED AT POST-OFFICE, SAN FRANCISCO, AS SECOND-CLASS MAIL MATTER. ESTABLISHED JANUARY, 1879. NUMBER 12.

THE

California Architect & Building News.

A MONTHLY JOURNAL,

Devoted to Architecture, Decorating, and Furnishing.

PRICE, $2.00 PER ANNUM.

The official organ of the Pacific Coast Association of Architects. Published by the SAN FRANCISCO ARCHITECTURAL PUBLISHING CO. No. 240 MONTGOMERY STREET, Rooms 11, 12, 13.

Subscribers will please notify us promptly of any failure to receive this journal, and also of any change in their address.

Advertisements inserted at reasonable rates.

SAN FRANCISCO, CAL., DECEMBER 15, 1886.

THE CONTINUANCE OF THIS JOURNAL.

WE hoped to have been able in this number to announce the new management of this Journal as completed, and to have introduced our successors by name to its numerous patrons. But as this pleasure is delayed for the present, we shall continue its regular issue with renewed energies, into 1887, with the determination that it shall not lack any of the qualities and recommendations which have gained for it

THE HIGH AND HONORABLE REPUTATION

it now has, through hard, earnest effort and personal sacrifice.

It is highly probable that at an early day it may be our pleasure to pass its interests into worthy hands, who will prosecute the work until it shall be excelled by no other journal in the United States, as far as all needed purposes of the Pacific Coast and a practical, instructive, and indispensable publication is concerned.

California and the Pacific Coast require just such a journal, and we propose to continue to supply this great want, and

SHALL CONTINUE ITS PUBLICATION

until satisfactory arrangements can be made with parties capable and qualified to assume its management, and prosecute its future to the full extent of

ITS GREAT POSSIBILITIES.

THE EIGHTH VOLUME OF THIS JOURNAL WILL BE COMMENCED WITH THE

JANUARY NUMBER, 1887.

IT was reasonable to anticipate that some one of the many very earnest negotiations that have been opened touching the sale of this journal would, ere this, have resulted in an arrangement by which we should have been enabled to announce in the present number a change of management and proprietorship. Such, however, not being the case, it will appear in January, 1887, with more than the usual

HANDSOME ILLUSTRATIONS.

It has been decidedly interesting to note the numerous and varied earnestly expressed views of friends and patrons in reference to the course marked out by us of seeking relief from the *excessive* labors of editing and managing the interests of this journal, and the responsible duties of a practicing architect, to the latter of which we propose to devote our entire energies and attention after disposal of this journal.

Some seem to think, and tacitly to say, that, having "worked up so excellent a journal, we should continue to manage it." We accept the compliment, but claim the right to follow our own judgment as to personal interests and comforts. If the number of summer suns passing over our head had been twenty less than they now number, no reasonable offer would be an inducement to us to part with our interest and relationship with this journal, as there is a future for it sufficiently assured, and pleasures in manipulating and directing its matter and interests, to make it an object to retain our position. As it is, we shall continue our work into the coming year, and seek to hold its columns firm in the favor and patronage hitherto so liberally extended by appreciating subscription and advertising patrons, so that, when others do assume control, the foundation of future success will be in good and sound condition.

Our Black List.

SINCE the publication of our intention to print a list of all delinquent subscribers in our December number, we have been pleased to see the unanimity with which those owing money have either forwarded the same to us, or written letters asking further time, or otherwise explaining the cause of the arrearage. We want it distinctly understood that no threat was intended in our notice to publish names. We have been to a great expense to build this journal to its present standing, and, having trusted many of our patrons for one or two years, we claim that it is our right to have monies owing us paid at once. If not paid, we will publish the list as contemplated, and then take such means as the law allows to collect all claims justly due.

For the benefit of those who do not understand the law in regard to the payment of subscriptions to any journal, we publish the following digest of decisions that have been rendered by our Superior Courts:—

1. *Any person who takes a paper regularly from the office—whether directed to his name or another's, or whether he has subscribed for it or not, is responsible for the payment.*

2. *If a person orders his paper discontinued, he must pay all arrearages, or the publisher may continue to send it until payment is made, and collect the whole amount, whether the paper is taken from the office or not.*

3. *The Courts have decided that refusing to take newspapers and periodicals from the post-office or removing and leaving them uncalled for is prima facie evidence of fraud.*

OUR JANUARY NUMBER 1887 WILL BE HANDSOMELY ILLUSTRATED.

Annual Building Summary for 1886.

WITH this issue the building record for 1886 is closed, and those whose interests it is to watch the development of our building resources and engagements can calmly consider the whys and the wherefores why the summary is not as large as the previous year. The year opened auspiciously for an active season, and hopes were entertained that a regular building boom would take place later on in the season; but, as time rolled on, the engagements became fewer, until, at the present time, building is almost at a standstill, with no immediate prospect of a recovery. The late unhealthful excitement in regard to stocks has completely demoralized the minds of those who, but a short time ago, were content to receive a fair percentage on their money; and the slow process of saving money by the sure methods adopted by our working classes for the past few years, have been scattered to the winds by their fierce efforts to make a fortune by gambling in stocks.

The low prices of our cereal productions have also been the means of retarding building growth. We know of three captains who intended to build either in this City or Oakland, but the low price of wheat, creating low charter prices, really prevented their wishes being carried out, and so, for "a last voyage, my dear, you shall go with me," their families made the trip to Havre and Liverpool merely to reduce expenses.

The exciting election also had a tendency to draw people's attention away from building. This had no sooner been settled than the first cause above mentioned completely demoralized building activities. Other causes might be noticed, but those enumerated are sufficient. But few large buildings have been commenced during the year. In this respect the succeeding year promises more than that just closing.

LABOR AND MATERIALS.

The labor market has been strong, and is to-day in a very satisfactory condition. A less number of skilled mechanics are unemployed than at the same time last year. The demand for the country is, and has been, very good, with no present signs of abatement. Lumber is much higher than one year ago; in fact, it has been raised to such a figure that it materially affects the cost of a building. Hardware is also held at firm prices. Bricks are much lower than quoted at our last yearly report. Contractors are growing wilder in their calculations, and it is getting about time that owners should consider the *man* who presents the lowest bid, as well as the amount of the *bid* itself.

SUMMARY.

During the first six months of 1886 there were quoted in this journal

670 building engagements, valued at $3,665,964

and for the last six months

478 building engagements, valued at 2,735,705

thus making a grand total for 1886 of

1,148 building engagements, valued at 6,401,669

COMPARISON.

The number of building engagements, and their value, since 1880 are as follows:—

1880—	397	engagements, value	$1,754,435
1881—	533	" "	3,700,732
1882—	785	" "	3,896,212
1883—	803	" "	5,261,689
1884—	1,127	" "	6,202,807
1885—	1,457	" "	7,043,999
1886—	1,148	" "	6,401,669

Although not equal to the bonanza year of 1885, still it must be admitted that the showing is a very good one. In the above estimate we have allowed for the Flood mansion on California Street, no account of which has heretofore appeared in these columns.

GREETINGS.

We cordially return our thanks to those who have so successfully endeavored to maintain this department of this Journal to that excellence which has compelled all to admit that, for the fullest information in regard to building news, the California Architect stands without a rival on the Pacific Coast. To our country informants we extend our sincere thanks for favors rendered, and trust to deserve their support in the future. Let all who can give a helping hand towards sustaining a class Journal strictly devoted to those designated by its title.

Architects, Attention!

We want every architect on the Pacific Coast to contribute a short article for the January number of this journal. It should be your aim to make your home journal interesting to all who may read it, and there is no surer way to obtain this end than by each one writing a short article. Illustrate it, if need be; we will make the cuts. Be sure that the articles reach this office by the 5th of January.

To Contractors.

What contractor in the city but knows of some little idea that would be beneficial to the readers of this journal. Help to build up this journal by a free interchange of thoughts. It will pay you tenfold to be in communication through our columns with all the master mechanics of the Pacific slope. Do not let the thought enter your mind that you cannot write well enough. Do the best you can, and we will see that your ideas are presented in proper shape. What say friends Terrill, Day, Smilie, Mahoney, Gray, Owens, Moore, Worden, and a host of other mechanics tried and true, of the building contractors of California?

Apprentices.

When you have found out any ideas that should be known by every one, forward them to us, and we will publish them under your own names, that others, hearing of your good deeds, may go and do likewise.

Mean People.

THOSE WHO READ PAPERS, BUT NEVER SUBSCRIBE TO THEIR SUPPORT.

THERE is a class of people who are absolutely mean. Honest they claim to be, and may be in a general sense, but it is little less than dishonesty on the part of those who are able to pay for journals to borrow them from others to obtain their contents, or in other ways to gain possession of them, for the purpose of extracting the information and instruction contained in their columns. Every line of a printed journal costs its author money, and no one enjoys the right to appropriate to his own use and benefit that for which he pays nothing. We daily meet persons who have something to say in praise of this journal and its contents, and tell how eagerly they peruse its pages, but whose names are not upon our subscription list. This is a shame, and we suggest to such the absolutely unfair and dishonorable course they are pursuing. If it contains instructive and interesting matter—a fact which we have never heard questioned—then every man who reads it should subscribe to its support. And if all *free readers* will send in their subscriptions, we will soon be able to increase its interest in all departments.

Let all subscribe at once.

Setting Out Stairs.

AFTER determining the height of the riser from the "story rod," the right proportion of tread must be found. Sometimes steps are arranged so that it is easier for a man to go up "two at a time" than to walk up in the proper manner. The reason is, both tread and riser are made small. When a riser is reduced, the tread must be increased; and the contrary when the riser is increased, the tread must be reduced in width. Joiners do not often break this rule, but masons very often do, notably in steps leading to and from railway stations. A simple rule may be given for finding a suitable proportion.

Take any suitable step as a standard step, that is to say, if you know of a staircase which is comfortable and easy to walk up, take it as a standard to gauge others by. Suppose you have a riser given, and require the width of a suitable tread, make use of the following proportion:—

As the given riser : standard riser : : standard tread : required tread.

If the tread is given and the riser required, then:—

As the given tread : standard tread : : standard riser : required riser.

To work out an example: Suppose 10-inch tread and 7-inch riser be taken as a suitable step, let 6-inch be the given riser; then by substituting the value of treads and risers for the names, we have—as 6′ : 7′ : : 10′ : the required tread; this gives $\frac{7.0}{6}$ or $11\frac{2}{3}$ for the size of a tread. Nicholson gives as a standard a tread of 12′ to a riser of $5\frac{1}{2}$′. Working out the example given by this proportion, we get 11′ instead of $11\frac{2}{3}$′; either of these sizes will be an agreeable step.

A rough and ready rule for the *usual* sizes of treads and risers is to make 2 risers and 1 tread equal to 24 inches.

NOW IS THE TIME TO SUBSCRIBE FOR 1887, $2.00 PER ANNUM IN ADVANCE.

A List of Mechanical and Architectural Works

NOW ON HAND.

The amounts given below are the Publishers' Cash Prices. We intend to reduce our stock, at present the largest of its kind in California, and therefore make the accompaning liberal offer.

DEDUCT ONE-SEVENTH FROM PUBLISHED PRICE.

elect any work from the list, deduct one-seventh of the price given, forward us the money, and by return mail yo will receive the book or books selected, with charge prepaid.

OUR JANUARY NUMBER WILL BE REPLETE WITH INTERESTING INFORMATION.

[Written expressly for this journal.]

The Origin of the Mechanics' Lien Law.

THE law of mechanics' liens, as we have it in existence to-day throughout the United States, is particularly an institution of this country, and was unknown in the earlier nations in the same manner and to the same extent as it now prevails with us.

There were, however, many of the fundamental and underlying principles of our law in vogue in England before our time; these were the creation of the civil law of that country. Domat, in his treatise on the civil law, says: "Architects and other undertakers, workmen and artificers, who bestow their labor on buildings or other works, and who furnish materials, and in general all those who employ their time, their labor, their care, or furnish any materials, whether it be to make a thing or to repair it, or to preserve it, have the same privilege for their salaries and for what they furnish as those have who have advanced money for these kinds of works, and which the seller has for the price of the thing sold." The privilege of the seller here referred to is thus defined by the same learned authority: "He who has sold an immovable thing, *for which he has not received the price*, is preferred before the creditors of the purchaser, and before all others *as to the thing that is sold*. Thus the seller who has not received the price may follow it (the thing sold), into what hands soever it may have passed, if he has delivered it before payment." Again: "The creditor, whose money has been laid out in preserving or repairing the thing, has a privilege, for he has preserved the thing; it being for the common interest, both of the proprietor and creditors; and it is, as it were, his own to the value of what he has laid out upon it." And again: "If a third person lends to an architect or other undertaker money which is laid out on a house, or any other work, and said money has been advanced by order of the master for whom the said work is to be done, this third person shall have the same privilege as if he had lent the money to the master himself for that use. But if the money was lent without the master's knowledge, or without his order, and if the master has paid the undertaker, he who has lent the money will have his action *only* against the *person to whom he lent it*. But, if the master has not paid the undertaker, this person may use the privilege, whether he has lent the money with the master's order or without it." Sir Thomas Tomlin defines undertakers as "such as the king's purveyors, employed as their deputies. The name is given in several statutes to persons who undertake any great work, as draining of fens," etc. Clearly, the contractor under our law, and the undertaker under the English law, are the same. It will thus be seen that in England a *privilege* attaches only to the thing itself over other creditors; while in this country a *lien* attaches not alone to the thing, but to the land. The American system is purely statutory, and derives nothing of its origin from the civil law of England.

Speaking of the legislative foundation for a lien law, Mr. Phillip says: "None were ever adopted, and none to this day are to be found on the statute books of Great Britain, securing in any manner to the mechanic or material man a lien on the buildings which their industry or capital have contributed to erect." The necessity for a lien law arose undoubtedly from two causes: First, all absence of even the remnant of the hampering and cumbersome feudal land system, and the fact that here the land was coming into the possession of the masses; while in England the landed estates were held only by the few; and second, the necessity to aid in the rapid improvement of the land, by giving to the mechanic and material man, whose work and materials were the necessary means to such improvement, full security for the value of his labor and the materials which he might furnish. On September 8, 1791, the Commission appointed to improve as speedily as possible the city of Washington, as the permanent seat of the National Government, adopted a memorial, from which we quote: "Your memorialists conceive it would encourage master-builders to contract for the erecting and finishing of houses for certain prices agreed on, if a lien was created by law for their first claim *on the house erected, and the lot of ground on which it stood.*" On December 19, the General Assembly of Maryland passed the first distinct and definitive law in this country. The first law was, however, very meager and crude, and by no means as useful as that which to-day forms part of the statute law of every State in the Union.

This law was at first greatly disliked, and met with opposition in the courts and in the legislative bodies; yet it has steadily grown in favor, until its importance and benefits are acknowledged alike by both. There is yet much room for advancement before that point is reached, and a law is upon our statute books which, giving an undue advantage to some, recognizes and protects the rights of all.

It may not be out of place, then, to say that this important law, which was created in 1791, had for its mother the principles of the civil law of England, as we have stated; and for its father the minds of Jefferson and Madison, both of whom were at that time members of the Commission which recommended the passage of such a law.

And so it is that to-day we have in this State a lien law, a creation of the Constitution, and an enactment of the Legislature.

To Dispose of Kitchen Garbage.

MEN of intelligence, housholders, and housekeepers ask us how it can be done without the fumes or gases getting into the house. I answer, Very easily. First, as to the manner or *modus operandi*: The burning of coal fires in ranges and in cooking stoves constantly gives off gases more volatile, more penetrating, and more poisonous and deleterious than the gases from the burning of the refuse kitchen matter, such as potato peelings, turnip tops, and other trimmings, when thrown into the fire, when these substances are fresh; and so also of the scraps of meat, bones, etc., after dinner, if thrown into the fire. Now, if the gases that are generated constantly by the burning of coal fires in ranges and stoves are all carried off harmless and unperceived, as they are by the chimney, the less penetrating and less powerful gases from the kitchen refuse will be carried off harmless and unperceived.

This is about all the philosophy there is about it, and it is a perfectly simple process; any man or family can try it and *do it*. As to this material being of any value or any use to anybody, as some say it is, and ought to be saved, it is quite a mistake; it is of no sort of value or use to anybody who has not a pig-pen near his house, to throw it into whilst it is fresh; to attempt to save it in large cities is penny-wise and pound-foolish. It costs more than it comes to, for it cannot be kept any time without undergoing decomposition and becoming putrid and filthy; and it is this *vile leaven* that poisons the streets and fills the air with pestilence, supplying the pabulum of diphtheria and fevers the most malignant and deadly, not only in the streets, but in the houses; and whole hetacombs of children are slain by the unseen foe that enters our dwellings in the filthy garbage box. The boxes or receptacles of this vile stuff cannot be kept clean; they are a nuisance in or about the house or on the premises. In a few cases, in cities where large hotels have a farm near by, the material can be carted off before it becomes putrid, and used in the hog-pens. Very few know the importance of keeping our dwellings free from all decaying matter. Cleanliness is next to godliness; pure air and pure water, the first essentials for life, are the gifts of our Creator, and when they come from his hand they are pure and undefiled.

The Helping Hand.

WE ask ONE and ALL of our kind friends and patrons to assist us in the matter of subscriptions and advertisements. In doing so, they will each receive full recompense in the ENLARGEMENT and IMPROVEMENT OF THIS JOURNAL. The past does not fully illustrate the future, and we hope erelong to be in a position to inaugurate and perfect all the contemplated better things which will come to pass—a part of the programme laid out by the founder of the CALIFORNIA ARCHITECT AND BUILDING NEWS. We have received congratulations from a thousand sources, and flattering notices from scores of journals published on this coast, and east of the "great divide," but that which we require most is, MANY THOUSAND MORE SUBSCRIBERS. We have done the best we could under the circumstances, but with the enlarged circulation secured, for which we ask and aim, we shall produce a California Journal which in all the departments of architecture, mechanical and other sciences, and matters sanitary, hygienic, etc., will be a source of pride and instruction to the people of this coast.

A RECENT issue of the *Fireman's Journal* has the following: "The hand grenade craze is dying out and several companies have practically abandoned business. The *Journal* was the first paper in the country to expose the worthlessness of these so-called fire extinguishers. We did so at the sacrifice of considerable advertising patronage, but we were satisfied that they could not be conscientiously recommended. Persons putting their trust in the efficiency of hand grenades to extinguish fires, we were convinced, would find themselves deceived. Gradually the press and public came to our way of thinking, and hand grenades lost their popularity. A barrel of them was never worth a bucket or two of water, and one chemical extinguisher would do more real service in putting out fires than a car load of them. Hand grenades have had their day, and the gullible public is now waiting for some other cheap device to waste its money on."

EVERY ARCHITECT SHOULD TAKE A PRIDE IN BEAUTIFYING THIS JOURNAL.

A Gothic Cottage.

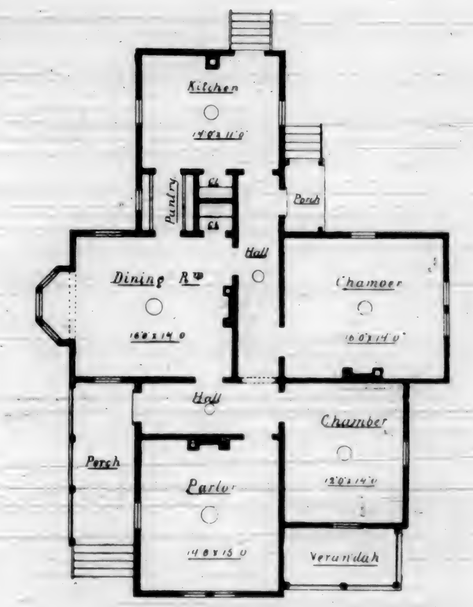
I GIVE in this design the floor plan and elevation of a small, one-story, five-room Gothic cottage, compactly and economically arranged, and suitable for any family desiring a cottage of this style or design.

The building is entered at the side, from a large porch, into a hall, with the parlor on the right and the dining-room on the left, and an arch, with ornamental brackets, connecting the two halls. The rear hall is four feet wide and twenty feet long, and has an outside entrance door protected by a small porch, thus affording an exit to the rear yard without the annoyance of passing through the kitchen. The kitchen is isolated from the remainder of the house, thus preventing all disagreeable odors from penetrating the other apartments. The dining-room and kitchen are connected by a large pass pantry, provided with shelves, drawers, etc., and well lighted by a window, and each room has a large closet which can be used for china, linen, towels, cooking utensils, etc. The separate entrance to the kitchen makes it convenient to reach the wood-shed and slop-hopper placed near the foot of the steps.

The dining-room is of sufficient size to accommodate a large family, and is provided with a fire-place and bay-window, making it a very pleasant sitting-room to sew or read in. The bay-window has transom lights, glazed with colored glass, giving the room a very pretty effect as the sun shines through them. The parlor and chambers are finished in natural shade of black-walnut, and each fire-place is furnished with marble mantels, plated bar fenders and fronts. The dining-room and kitchen are wainscoted, and all wood-work grained imitation of oak. In the center of all rooms are placed ornamental plaster of Paris center pieces of suitable size. The exterior of the building is plain and inexpensive, yet very attractive. The tracery gables are finished with large rosettes and fancy shingling, and the bay-window with neat brackets and panels, surmounted by a small fancy balcony. The porch, veranda, and double windows, although plain, give the building a pleasant and striking appearance. Any person desiring to build a cottage of this style will save money by addressing, for further information,

DAVID SALFIELD, *Architect*,
216 Kearny Street,
San Francisco, Cal.

A GOTHIC COTTAGE.



FLOOR DESIGN OF A GOTHIC COTTAGE.

A New Work on Designs for Dwellings.

A NEW book of designs is now being printed by Mr. D. Salfield, embracing plans and elevations for every description of a country and city dwelling. The accompanying cut is selected as representing a cottage of Gothic design. One of the main objects seems to have been the production of a neat but unique exterior, and yet one which can be built at moderate cost. The description given is very comprehensive. Each design is presented in a clear manner, with dimensions plainly marked. The price of the work has been placed at the low cost of fifty cents each, upon receipt of which a copy will be forwarded to any address. Agents desiring to secure territory for sale of this work can do so by directing a letter to Mr. D. Salfield, 216 Kearny Street.

The above work is now in press. We will speak more extendedly of it in our January issue.

TREES UNFELLED ARE REAL ESTATE.—There was an amusing case tried here the other day. Some smart fellows from up North were perusing around for timber and happened upon an old, unsophisticated farmer and bought from him forty walnut trees for $5.00 apiece as they stood. They paid the money and took a bill of sale, and the old man felt rich. When the old woman came home he told her what a bonanza he had struck. She was surprised, but was not satisfied, and said it was a Yankee trick. In a few days another feller came along and offered $10 a tree, and she made the old man sign, and she signed, too. The money was tendered back to the first purchaser but he refused to take it and sued for the timber. The court held that trees not cut down were part of the realty, and realty could not be sold without the wife's signature; so the sharpers lost their timber and their money, too.—*The Atlanta Constitution.*

IT is the thinking man who makes improvements upon existing methods. A planer, a moulder, or some other machine may be defective in some slight way, and the thinking man soon finds it out, tells the manufacturers of it, and the fault is remedied. But the man who only "puts in time" is not apt to find out these things.

Going Security.

I AFFIRM that the system of indorsing is all wrong and should be utterly abolished. I believe that it has been the financial ruin of more than, perhaps, all other causes. I think that our young men, especially, should study the matter carefully in all its bearings, and adopt some settled policy to govern their conduct, so as to be ready to answer the man who asks them to sign his note. What responsibility does one assume when he indorses a note? Simply this: He is held for payment of the amount in full, principal and interest, if the maker of the note, through misfortune, mismanagement, or rascality, fails to pay it. Notice, the indorser assumes all this responsibility, with no voice in the management of the business, and no share in the profits of the transaction, if it prove profitable; but with a certainty of loss if for any of the reasons stated the principal fails to pay the note.—*Judge Waldo Brown.*

INCREASED PATRONAGE WILL ENABLE US TO MAKE STILL FURTHER IMPROVEMENTS.

ASKED, ANSWERED, AND COMMUNICATED

☞ Architects, Contractors, Carpenters, and Mechanics generally are respectfully requested to furnish us items of interest for this column. We will gladly answer any and all questions pertaining to the architectural and building interests. If illustrations are necessary to explain your ideas, send us a sketch of them and we will make the cuts.

Free to All.

The columns of this journal are open to all who differ with us upon any subject presented. We are too old in years and experience to assume that we have passed the reef of human liability to err, or for one moment to suppose that we have reached the realms of thought where perfection reigns supreme. But this we do assure—that whatever of error there may be contained in our columns will be speedily corrected, as soon as attention is directed thereto, and we are convinced of the error. We will give place to a reply in any case, when a mistake or wrong statement has occurred. It is our desire and purpose to be fair, just, and correct in all things, and do no person or subject any violence. We therefore invite free discussion and criticism, and again state that the columns of this journal are at the service of all who desire to differ with us upon any theory or subject, or who take exception to anything at any time appearing in our columns.

Country Architects

Can greatly help us by forwarding to this office information in regard to building and other improvements in their respective localities.

San Francisco, Dec. 3, 1886.

Editor California Architect and Building News: Will you please give a receipt in the Everybody's Column of your journal to dissolve silver, for instance a piece of coin, so as to make a solution of silver, and oblige a

Mechanic,
A subscriber since 1879.

Nitric acid will dissolve silver. It will also dissolve any alloy with which it may be mixed.

San Francisco, Cal., Nov. 19, 1886.

Editor California Architect—*Sir:* Will you please to favor me with a rule to mark out the top and bottom cut of a sloping brace of square timber, which stands with one diagonal corner vertically over the opposite; that is to say, the cross section of the brace is diamond shaped <>, and not square, as is usual. I cannot find a method for these cuts in any of the books on carpentry which I have examined.

Very respectfully submitted, D. Bink.

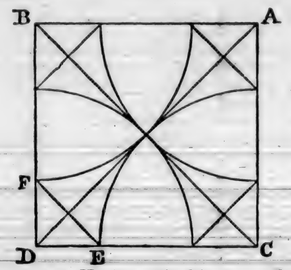
We have published rules for the above, but would be pleased to hear from any of our mechanical friends who will demonstrate the proposition. Make the drawing necessary, a rough one is sufficient, and we will make the engraving and publish the explanation.—Ed. Architect.

Editurs Arkitect: Don't want your paper anoth r year; you don't got good phylosophey in it, and don't tel how to get a hip raftur so the jints will be strate, nor how to Rekote old sand paper with new sand when the furst sand is rubd off. What diskount wil you allow for new names on your book?

R. G. Best,
A Karpintur.

Mr. Best is cordially thanked for above letter. Such letters do an editor's heart much good. First, he does not want our Journal, and then wishes to be appointed an agent to solicit subscriptions. Thanks, Mr. Best, we will begin the good work by adding your own name on our list for 1887, that is, upon receipt of $2.00, our regular subscription price.

Continued Favor.—The numerous letters and postals received from various parts of the United States, seeking advertising space in our columns, soliciting sample copies, etc., all attest that the reputation of this journal is co-extensive with the limits of the great continent upon which we dwell; and all this without a single effort on the part of present management during the past eighteen months to solicit patronage by any of the usual methods adopted, other than the regular monthly issues. We long to see this journal in the hands of younger enterprising and competent parties, who will take hold and utilize the many offered and offering opportunities to make it a greater success even than it has been.



Editor Architect: Having noticed in your valuable journal, in the past few issues, different ways of describing an octagon, I send you the following, which, although old, is neat and good. Draw diagonal, as A D, in any given square. Take one-half of it for a radius, and, with A B C D as centers, describe the segments of a circle. Join the points of intersection, as E F, and you have a perfect octagon.

This is the correct way to frame the key for a splice,

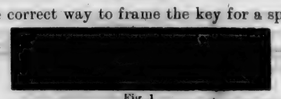


Fig. 1.

And this is the wrong way.

Fig. 2.

The driving in of the key, as shown in figure 2, has a tendency to split off the triangular section, as shown by the dotted lines, there being but little wood to resist the pressure.

Afraid of Themselves.—Many who have consulted us in reference to the purchase of this journal's interests, have hung upon the fear that *they* do not possess the qualifications necessary to success. Every time this is repeated it causes a smile, remembering, as we do, that without a single hour's practical experience as editor or publisher, either as principal or employé, during the gloom resultant from the sandlotism of 1879 this journal was first started, with *no other* backing than personal energies and determinations, not even the advice of others who had embarked in a like publication, for there had been no journal of like character published upon the Pacific Coast prior to this. And if, with all these disadvantages, and the terrible financial conditions then existing with ourselves and generally, so much has been accomplished, and so presentable and successful a journal established and sustained, what may not be done in the future, with all the avenues of success opened up, the whole field of operation made plain, and every facility acceptable, requiring only the individual efforts and energies of the right men in the right place to produce results of the most satisfactory character? There is no more reason to doubt the permanent and profitable success of this journal, under efficient management, than there is to doubt any other reasonably well-assured thing.

Practical Lessons on the Science of Carpentry.

A WORK that every mechanic should have. It is designed to make the science and art of carpentry clear and comparatively easy to all who require information on the subject. This book is also of use to all who have barns, bridges, and out-houses to build, and require information how to accomplish the work. Price of this work is now but $4.00, having been reduced from $5.00 to above amount. Sent, post-paid, anywhere in the United States or Canada.

Delinquent Subscribers, Notice.

Remember, according to decisions in the courts, before a subscriber can discontinue any publication "HE MUST PAY ALL ARREARAGES," or the publisher may continue to send the paper or journal until payment is made, and collect the whole amount WHETHER THE PAPER IS TAKEN FROM THE POST-OFFICE OR NOT.

"It Ought to Be a Good Investment."—Facts and figures prove that this journal *is*, and, we say unhesitatingly that, in competent and qualified hands, it *can* be made one of the successful, paying publication interests of the Pacific Coast.

BOUND NUMBERS OF THIS JOURNAL MAKE A SPLENDID BOOK OF REFERENCE.

PREMIUM DESIGN OF THE SAN JOAQUIN COUNTY COURT HOUSE, DAVID SALFIELD ARCHITECT.

How to Cool a Cellar.

We reproduce the following from the *Scientific American:* A great mistake is sometimes made in ventilating cellars and milk-houses. The object of ventilation is to keep the cellars cool and dry, but this object often fails of being accomplished by a common mistake, and instead the cellar is made both warm and damp. A cool place should never be ventilated; unless the air admitted is cooler than the air within, or is at least as cool as that, or a very little warmer. The warmer the air the more moisture it holds in suspension. Necessarily, the cooler the air, the more this moisture is condensed and precipitated.

When a cool cellar is aired on a warm day the entering air being in motion appears cool, but as it fills the cellar the cooler air with which it becomes mixed chills it, the moisture is condensed, and dew is deposited on the cold walls, and may often be seen running down them in streams. Then the cellar is damp and soon becomes moldy. To avoid this the windows should only be opened at night, and late—the last thing before retiring. There is no need to fear that the night air is unhealthful—it is as pure as the air of mid-day, and is really drier. The cool air enters the apartment during the night, and circulates through it. The windows should be closed before sunrise in the morning, and kept closed and shaded through the day. If the air of the cellar is damp it may be thoroughly dried by placing in it a peck of fresh lime in an open box. A peck of lime will absorb about seven pounds, or more than three quarts of water, and in this way a cellar or milk-room may soon be dried, even in the hottest weather.

An Omen.

A SUPERSTITIOUS subscriber, says one of our exchanges, who found a spider in his paper, wants to know if it is considered a bad omen. Nothing of the kind. The spider was merely looking over the columns of the paper to see who was not advertising, so that it could spin its web across his shop door and be free from disturbance.

Rise in Lumber.

Prices of lumber have been raised to about correspond with the schedule of 1879. Building in consequence has received a temporary set-back.

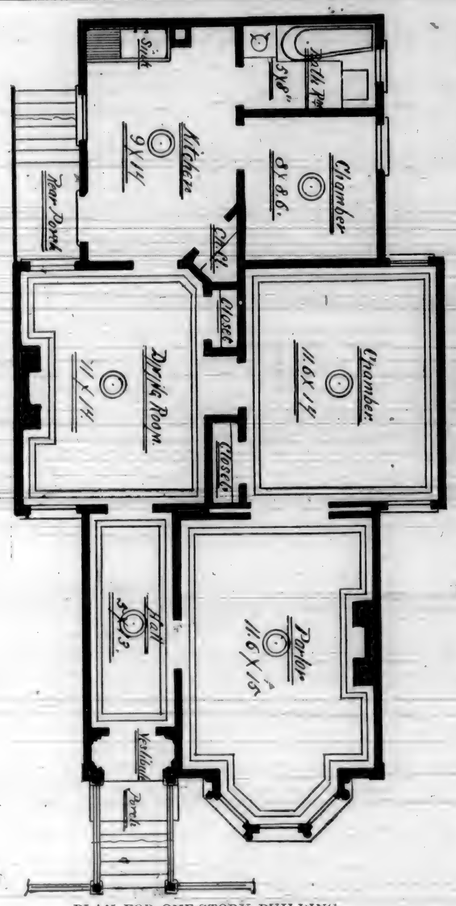
As He Begun It So Shall He Finish It.

Were it possible to hang up mottoes in shops, as sacred and patriotic mottoes are exhibited in homes to stimulate remembrance and instruct children, the above is the advice and admonition I would impart to every mechanic on his entry into a shop, not only to inform him that he must exercise care and skill on the work which it will be his task to reform, but to teach him also perseverance and patience during the performance. All thinking mechanics are fully aware how much these two attributes are necessary to success and how difficult it is to acquire them, even though resolution aids in the effort to develop them.

Is it not a frequent sign to see one lose patience over some trivial joint or apparently unattainable miter and ultimately avoid or alter the plan laid down for its execution? It is only too often seen and is explained by stating that patience and the powers of reasoning are not brought into action, but remain dormant, and consequently useless at the very time they should be actively awake and helping. The most important aid is neglected. What a difference it would make, if, as skilled workmen, we bring the greatest gift we are endowed with (to wit, the intellect) to bear on what the tool, guided by the hand, is to shape and combine, if, when we did not comprehend, we compared line with line, placed each piece and joint in its place on the plan so clearly defined in our mind, considered even the smallest detail, and, above all, were courageous and tried. Better far to fail in our honest effort than shirk that which we are bound in conscience and the duty owed to our employer to endeavor. By these means, what one begun one would (as he ought to) complete satisfactorily to himself and those to whom he is responsible.

Complimentary Notices.—We might fill several pages of this journal with the unsolicited, complimentary notices that have from time to time appeared in a hundred or more of the standard class journals of the United States, and the daily and weekly journals of the Pacific Coast, many of them ranking this unequaled except by about three of the leading Eastern journals, enjoying the great advantages of wealth, long existence, and extensive and perfect facilities. This, and all other facts in connection, serves to eliminate all reasonable doubt as to the future of this journal in right hands.

EVERY EFFORT WILL BE PUT FORTH TO MAKE THIS A SPLENDID JOURNAL.



PLAN FOR ONE-STORY BUILDING.

Bookless Homes.

We form judgments of men from little things about their houses, of which the owner, perhaps, never thinks. Flowers about a rich man's house may signify only that he has a good gardener, or that he has refined neighbors, and does what he sees them do. But men are not accustomed to buy books unless they want them. If, on visiting the dwelling of a man of slender means, we find he contents himself with cheap carpets and very plain furniture, in order that he may buy books, he rises at once in our esteem. Books are not made for furniture, but there is nothing else that so beautifully furnishes a house. The plainest row of books that cloth or paper ever cover, is more significant of refinement than the most elaborately-carved *etagere* or sideboard.

Give us a house furnished with books rather than costly furniture. Both, if you can, but books at any rate. To spend several days in a friend's house, and hunger for something to read, while you are treading on costly carpets, and sitting on luxurious chairs, and sleeping upon down, is as if one were bribing your body for the sake of cheating your mind.

Books are the windows through which the soul looks out. A house without books is like a room without windows. No man has a right to bring up his children without surrounding them with books, if he has the means to buy them. It is a wrong to his family. Children learn to read by being in the presence of books. The love of knowledge comes with reading and grows upon it. And the love of knowledge, in a young mind, is almost a warrant against the inferior excitement of passion and vices.

Let us pity those poor rich men who live barrenly in bookless houses. Let us congratulate the poor, that in our day books are so cheap that a man may every year add a hundred volumes to his library, for the low price of what his tobacco and his beer would cost him. Among the earliest ambitions to be excited in clerks, workmen, journeymen, and, indeed, among all that are struggling up in life from nothing to something, is that of owning, and constantly adding to, a library of good books. A little library, growing larger every year, is an honorable part of a young man's history. It is a man's duty to buy books. A library is not a luxury, but one of the necessaries of life.

The color of old oak is pleasant for bed-chamber woodwork, and in north rooms terra cotta paper of an old pink shade is pleasing; and in south rooms olive green of a middling dark and golden shade. Tint ceiling, pale, soft olive green.

There is no absolute need of painting zinc work, for exposing it to the atmosphere has the effect of coating it with a thin film of oxide, which protects it from the future action of the air as effectually as paint.

Assignments of Wages.

Since the law requiring the assignments of wages to be recorded in the cities and towns of the State went into effect, the number of such assignments is believed to have been more than doubled in this city. In September, sixty-five deeds of assignment of wages were recorded at the city hall, and thus far this month the record is twenty-nine. There is firm conviction that the new law operates as an inducement to fraud. Women appear at the city hall almost every day, and, with tears in their eyes, complain that men who have been boarding with them have assigned their wages, and upon application to the employers for assistance in collecting the board bills, they have copies of the deeds of assignment thrust in their faces and are told that there is no redress; they must place the bills on the profit and loss account. One case is known of, where the employe assigned her wages to a perfect stranger, to whom she did not owe a penny, and for the purpose of defrauding a boarding mistress who had been more than ordinarily obliging. The assignee, upon learning the particulars of the case, immediately collected the entire wages due the woman and paid them to the boarding mistress. That there are parallel cases is quite probable, especially when wages are assigned to small liquor dealers, as they frequently have been.—*Providence Journal.*

A Good Old Idea.

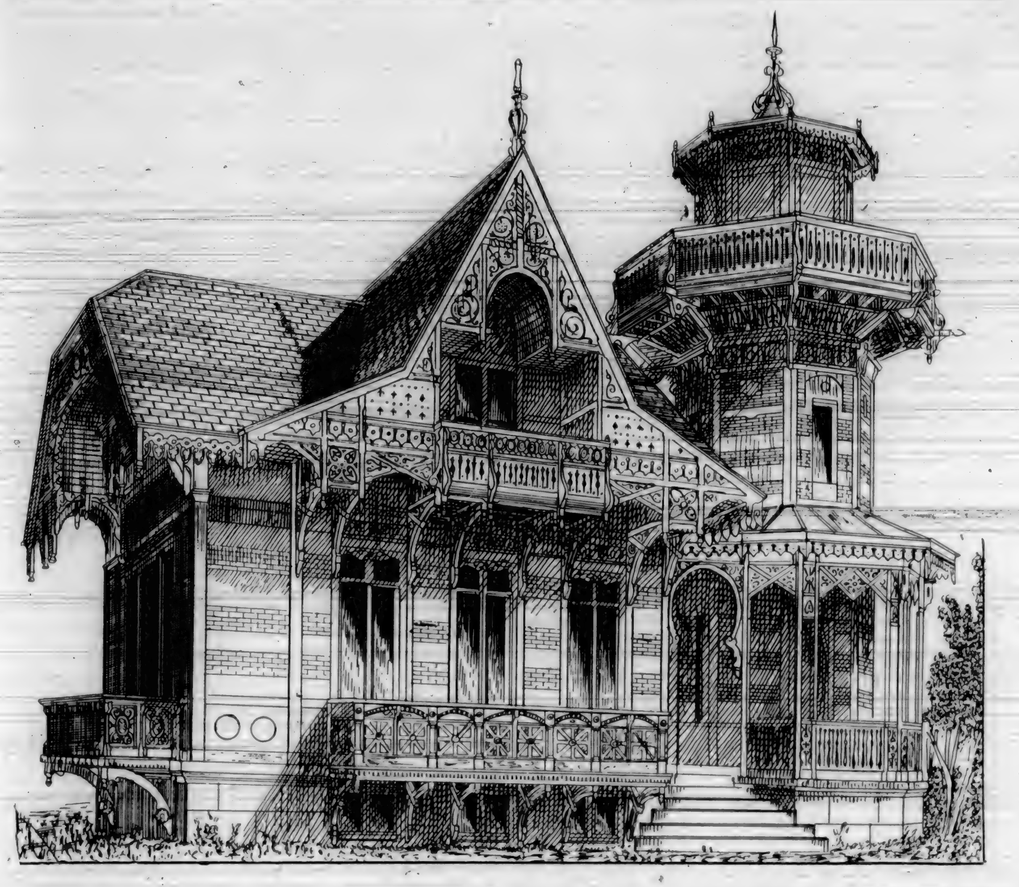
That the eight-hour movement is not a modern idea may be learned from the verse which appeared on a banner carried at a workingmen's demonstration in England between 1815 and 1820:—

Eight hours of work,
Eight hours of play,
Eight hours of sleep,
Eight shillings a day.

Some time since, says the *Building News*, United States Architect Clark suspended a plummet line from the interior of the dome of the Capitol building at Washington, and it was found, by actual measurement, that the lead swung over a space of four and one-half inches, making a total dip from the perpendicular of eight and one-half inches. This movement involves the entire dome, and to some slight extent the entire structure, and is caused by the alternate contraction and expansion due to the action of the sun upon the material of which the building is composed. No doubt the principal part of the motion is due to the more ready expansion of the iron of which the dome is constructed; but similar experiments at Bunker Hill Monument show that a structure built entirely of stone and mortar is also similarly affected by the sun's action. It has been very properly said that by this motion the statue of the Goddess of Liberty, upon the summit of the dome, daily courtesies to the rising sun, and salutes him in a like manner as he sinks to rest, but without the formality of turning herself around.

Some workingmen who are dissatisfied with the social conditions and affairs generally in this country, think that no benefits accrue to them from protection. It is a mistake, and none would find it out quicker than the workingmen themselves, should the import duty be taken off. For instance, does any one suppose, taking the iron trade as a sample, that there could be a difference of $3.50 more per ton paid for puddling here than in England, unless there was a duty put on the foreign article into which muck iron enters? In other words, the price per ton for puddling in England is $1.50 (six shillings and threepence) as against $5.00 per ton here and in the West, and the iron workers here are in a very great measure indebted to a protective tariff for it.

EVERY ARCHITECT and CONTRACTOR ON the PACIFIC SLOPE SHOULD CONTRIBUTE



Design for a Country Seat.

The Builders' Agreement.

The organization of labor and the attempt of labor organizations to prescribe the terms and conditions of employment, leads necessarily to the organization of employers, and counter agreements as to terms and conditions. The most specific and important agreement so far made by employers is that entered into by members of the Master Builders' Association of Boston, on October 4, which is obtaining the signatures of other master builders throughout New England, and will go into effect on April 1, 1887. Its five articles relate to the method of payment, the hours of labor, a protecting clause in contracts in relation to strikes, improper interferences with business by workmen, and arbitration. Most of the rules agreed upon are meritorious, showing a disposition to make reasonable concessions, while maintaining rights that some of the demands of the labor organizations would subvert; in one or two particulars ground has been taken that is of doubtful expediency. The method of payment, after April 1, is to be by the hour, except for piece-work and in contracts by the year. The experiment of working but nine hours a day is to be fairly tried for one year, unless the workmen engage in a strike. The protecting clause in contracts, which architects and real estate owners have signified their willingness to grant, will relieve the builders of obligation to complete work at a specified time if their operations are interrupted by strikes. This will deprive strikers of a great advantage that they have often had. The "improper interferences" by workmen, which the agreement condemns as "unfair and intolerable," are strikes and threats to strike because certain other workmen are employed, because certain workmen are discharged, because certain stock is used or not used, because more than a certain number of apprentices are taken on, and for other equally untenable reasons. The agreement binds the builders promptly to discharge workmen who engage in such interferences, and to prosecute all conspiracies. The fifth article recognizes the right of employes to be heard individually or through a spokesman on any grievance, and promises arbitration as a remedy. All these are sound principles. The questionable part of the agreement, and the one that will probably make trouble, is the refusal to recognize the trade union or other labor organization, in any way. The labor organization has the same justification as the employers' organization, and it has come to stay. It is far wiser to adopt the discriminating policy of recognizing such of its acts and demands as are just, and refusing to yield those that are wrong or mistaken, than to attempt to ignore it.—*Work and Wages.*

Economy in Fuel.

One of the most difficult things to teach a girl is economy in fuel. Nothing seems to satisfy but a continual piling on of coal. As soon as a little gas has been burned off, a vigorous shaking and raking out of ashes follows; then the stove filled anew, touching and lifting the covers, which soon become red hot, and the process is repeated from morning till night. Teach her, in order to obtain and secure a good draft, the coal ought never to be above the lining; and in this connection I am reminded of another practice which seems to come to kitchen girls by intuition or handed down by tradition; that is, to put sad irons, or flat-irons, as generally called, on the stove over the hottest fire hours before use, consequently they are ruined, for if once heated to redness, will ever after retain heat but a short time, and lose their smoothness, too. I would rather lend almost anything else to a neighbor than a flat-iron. In ironing, have two holders to use alternately, thereby lessening the heat of the hand, and insuring a greater degree of comfort.

The workman that makes the most noise will be often found doing the least work, and doing it badly.

AN ARTICLE OR FURNISH US A SKETCH FOR PUBLICATION IN OUR JANUARY NUMBER.

Art and Architecture.

[Special for this Journal. By F. Hillert, Architect and Mechanical Engineer.]

XXXVII. DECLINE.

But has the time of an art period passed over and away from a people? Then to them of it remained a certain possession. Not as if the genius of large masters could be inherited to posterity, but its successors gain and retain some of the power and force over moulding and forming, and since the same by the former was raised to a high grade of perfection, they found themselves in possession of advanced technical means, which they could with ease use and handle. The high spirit, the daring flight of fantasy, and the truth of working of those whose technical means once served for the noblest formation, are passed from hence, and the successors are unable to replace its defects.

Instead of the clapping of the wings of a genius is now the miserable fluttering of a checkered creature, which nibbles to-day here, and to-morrow there. In such a way decline of art begins to set in; it is the third grade of each developing epoch, and fulfills the last possibility of the relation of the spirit and form to each other, namely, that the same brilliancy and splendor cover a poor idea, that the form, so to say, overreaches the spirit. The pretending aspect of such works of art by the emptiness and want of spirit repulses every finer sentiment, each trained and cultivated eye unresistingly, and fills with that uncomfortableness which everywhere spread shallowness creates. An effected and beautiful shaped woman dazzles many, but the one who can read in her spiritless eye the hollowness of her mind, will turn with displeasure from her. A Don Quixote, with a martial beard, clad in a brightly polished armor, will always find people who take him to be a true hero and knight, when, in reality, he is only a silly coxcomb. In art such works corrupt the less trained and unexperienced the easiest; then the form is pleasant, and through her to comprehend her meager spirit, is, in fact, no small difficulty. Anyway we always will see human figures and forms, always architecture and ornaments, but they are beings without soul, life, and individuality, embellishments of exaggerated form and false application.

That the decline must progressively increase, is only the sequence of the general laws of nature; and that a conscious, energetic will can work to oppose it, is a fact hardly wanting the proof. But where the same is not powerful enough, the evil increases and spreads, as an avalanche, with increasing force, so that at last, instead of a cure, a total extermination, either by force or its own weakness, must set in; that then the soil, cleared from the weeds and freshly prepared, can take up a new and healthy seed; and the same, in a pure, sunny atmosphere, can germinate and grow to a pleasant blooming. But the will of resistance is itself powerful; it will not only endeavor to find and perceive the relation, and oppose the hollowness by intrinsic performances, but it will also give the incitation to an aftergrowth and under conditions, to a new direction, if, namely, it can introduce a new element, a principle different from those existing, and with the former can unite in a new whole.

The departure from the harmonious, flourishing condition of the one where the brought over and imitated form preponderates, we name, in accordance with their spirit and sense, mannerism, and understand by it the characteristic of an art practice which works more by hand trained by use, executing hand work (trades like), as that they went back to original own work of mind and brain.

This handiness in working is learned and gained by the artist from exterior practice, and not obtained from his inner own force, and therefore he is only a casual possessor of the same, whose intrinsic real value he does not realize, so that a misuse of the same he cannot evade and avoid. His mode of treatment sinks by necessity to over-refining, to the exterior, to the mechanical, and therefore becomes just only a "manner," whereby his work becomes mannerism.

XXXVIII. EXAMPLES.

No epoch in art history is without those three grades, not even in the instance where the flourishing period is only conditional, and in relation compared to the state of culture of the time being, as with the one of all barbaric people. Although with them having only taken in a low point of the symbolic foregrade, nearly all were treated typically and with servility, nevertheless are those three periods of development, even if difficult to be recognized, and we will not take the trouble in vain to seek and find them in the Egyptian monuments. In the Greek art this division is publicly recognized; in the middle ages it comes clearly to view, and in modern times it is generally known. The classic age has in all times of large culture and historical developments, the longest and most lasting flowering period. The Christian middle ages were extraordinarily energetic and fruitful in the symbolic, but the late time surpassed all former epochs by a mannerism longer than 200 years; till our time, with the beginning of a new section of the history of the world, art also began a new development.

The past is not wanting examples of the three periods of development in architecture, sculpture, painting, etc.

XXXIX. RETROSPECT.

When we have separately recognized the work of the first grade alongside of those of the following period, it was done by forcible reasons explained; but if, on the contrary, the mannerism was condemned, we can hereby neither deny the necessity of its appearance, or that the same brings with it certain advantages, but which can be easily dispensed with; and between them are those of the most importance, that works of this kind, by reason of their mastery in form and their narrow and small spiritual value, are readily comprehended and are able to inspire large masses of half civilized for a certain participation for art. Certainly mannerism makes shallow, as the poetical originality to sober intentionality, as also grace to indolence and immodesty, chaste sensitivity to immoral vileness, and in this respect is even the small advantage offered, more as doubtful. In theory, as in the practical consequence, it remains in the same way rejectable, and is just as little to be sanctioned as any other decline in other spheres of life, if he, as the same is to be comprehended, is the necessary consequence of pre-existing developments. We see why at certain times science, statesmanship, religion, and morality must degenerate, and only art should stand outside of the general law; but as the decline of the former can be opposed, so in art can the same be checked, by clear comprehension, prudence, and a fixed will to do so.

Art demands a country flourishing in prosperity and in liberty. In a country with no liberty, in poverty, art cannot be. The struggle of the masses of the people must be above the wants and necessities; the single individual must carry his head erect in the full feeling of his humanity, if out of them a few preferred ones shall step out, to reach to their people their purest flowers, —the works of art. Social, religious, and State relations are therefore in art of a far-reaching influence. After the Persian wars flourished with Greek liberty, art; in Spain perished a growing art through the tyranny of priests and kings; in Germany, in consequence of the Reformation, the flourishing art was broken off (stopped); in the Netherlands the wars and victories against Spain created a new, high life of art; and, lastly, the revolution of 1789 and the wars of 1813 have in France and Germany developed a new art. Italy and other countries begin to stir anew. It is a constant and intense reciprocal action in a good and bad sense between the large events of history and the end and culminating points of art developments; but we will not investigate to what kind this relation is, *but will simply take* the unquestionable facts as such.

People of culture, enjoying at least some liberty, and whose means of learning were above the necessities to sustain life, such will certainly wish to have an own art practice, and try to come to its assistance and do all that is possible to retain itself in the possession of the flowering art. Of course the general condition of the people is the foundation of art, but can by this the more or less favorable bases of development be advanced or retarded, and it is therefore not without any importance to become enlightened and acquainted about the means for the practice of such influence. It may be admitted that with all efforts for the promotion of art, the intention to promote unquestionably lies before us; but, for all that, this endeavor not seldom turns out to the contrary, and is detrimental instead of being useful. The true and correct perception of the spirit of the art and of the condition of the people is the only sure and safe means to arrive lastly to the insight and comprehension of the good.

The fostering care of the art is necessarily divided into two domains: the one, where art is educated; the other, where art is practiced. The former depends on the means for education, the latter on the furtherance and promotion.

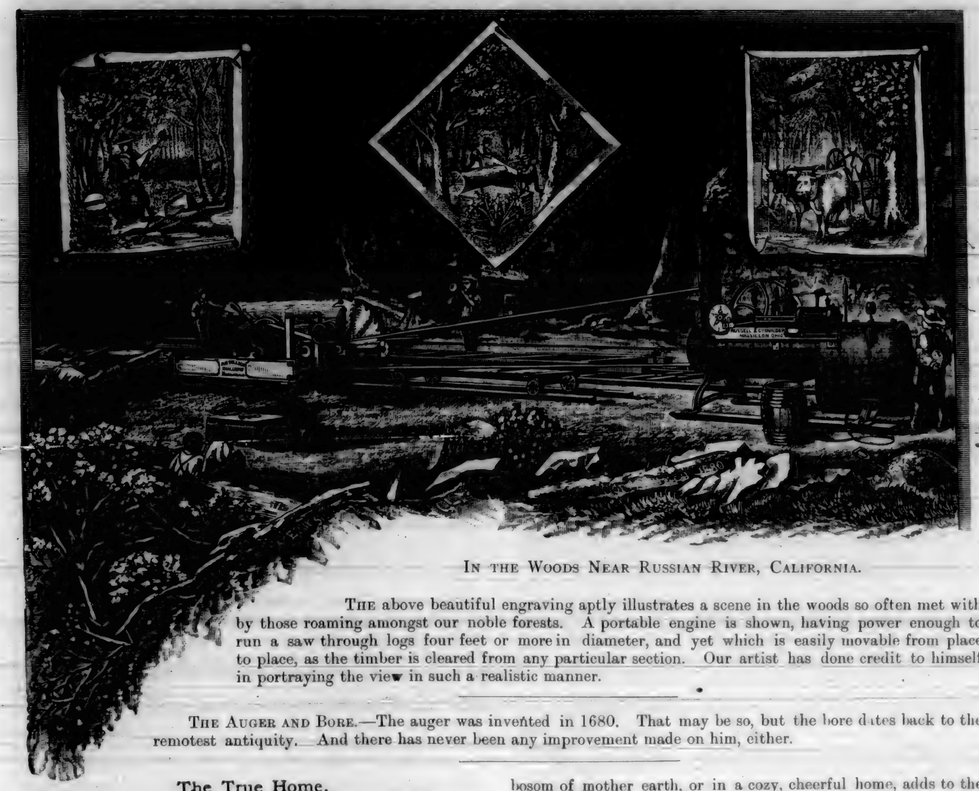
Invisible Nails.—For attaching mouldings and other light lumber a new kind of nail has been contrived, which leaves no nail holes. It is made with a point at each end and with an outwardly projecting head or shoulder midway between the points. The nail is first driven into the wood by means of a punch which straddles the protruding point and bears on the head. When enough have been driven in, the moulding is placed over the nails and driven down.

NEW ENERGY WILL BE DISPLAYED IN OUR JANUARY NUMBER. SUBSCRIBE NOW.



In the Woods Near Russian River, California.

The above beautiful engraving aptly illustrates a scene in the woods so often met with by those roaming amongst our noble forests. A portable engine is shown, having power enough to run a saw through logs four feet or more in diameter, and yet which is easily movable from place to place, as the timber is cleared from any particular section. Our artist has done credit to himself in portraying the view in such a realistic manner.

The Auger and Bore.—The auger was invented in 1680. That may be so, but the bore dates back to the remotest antiquity. And there has never been any improvement made on him, either.

The True Home.

The home should be as beautiful and pleasant as it is possible to make it. Home is the place for rest and pure enjoyment.

It is the refuge from care, trouble, and all the tumults and turmoils of life. It is the one spot where the heart's purest affections gather themselves, and seek their *chosen* resting-place. It is the woman's first duty to make this dwelling-place, over which she is the mother-queen, as cheery, cozy, and lovely as she can. The first requisite for this desired consummation is that she herself be happy, hopeful, pleasant, and contentedly agreeable. To become this she must live hygienically; she must eat proper food, wear comfortable clothes, and not be oppressed by too many cares and burdens. If she is her own housekeeper, she should study to do her work on the most simple and easy plan, cook but few dishes at a time, and have each as perfect in itself as possible.

Woman has no more important duty than that of making home pleasant. Neatness and cleanliness are indispensable to a cheery, cozy-looking room. A plain room, plainly furnished and scrupulously clean, is far more bright and beautiful than a more pretentious one richly adorned with costly furniture that is soiled, mutilated, and always in disorder. A few thrifty, nicely kept flowering plants and trailing vines are one of the most enlivening adjuncts to a living room, and a sheltered sunny window is far better for them, in moderately cool weather, than the overheated and often dusty inside position, and they are just as easily seen also.

Should there be unsightly objects in the room or recesses that contain necessary adjuncts to comfort and convenience, a bright chintz curtain will screen them from view, and will of itself make a pleasant resting-place for the eye. Should a bit of plastering fall from the wall, a piece of white muslin neatly pasted over the place will hide the defect and save all further scaling off and droppings of litter. In a thousand ways one can vail the ugly and add to the beautiful, until the humblest little home may become a very bower of pleasantness and cheerfulness.

The love of the beautiful needs the fostering care of every one who would make life pleasant and happy. Whoever creates a lovely picture, whether on canvas, in a poem, or on the broad bosom of mother earth, or in a cozy, cheerful home, adds to the world's priceless treasure, and does something toward elevating, refining, and happifying the race.

Stick to Your Business.

There is nothing which should be more impressed upon the minds of young men than the importance of steadily pursuing some one business. The frequent changing from one employment to another is one of the most common errors committed, and to it can be traced more than half the failures of men in business, and much of the discontent and disappointment which render life uncomfortable. It is a common thing for a man to be disappointed with his business, and to desire to change it for some other, which, it seems to him, will prove a more lucrative employment; but, in nine cases out of ten, it is a mistake. Look around you, and you will find among your acquaintances abundant verification of our assertion. There is an honest farmer who has toiled a few years, got his farm paid for, but does not grow rich very rapidly—as much from lack of contentment mingled with industry as anything, though he is not aware of it. He hears the wonderful stories of California, and how fortunes may be had for the trouble of picking them up: mortgages his farm to raise money; goes away to the land of gold, and, after many months of hard toil, comes home again to commence at the bottom of the hill, for a more weary and less successful climbing up again. Mark the men in every community who are notorious for their ability and equally notorious for never getting ahead, and you will find them men who never stick to one business long, but are always forsaking their occupation just when it is beginning to be profitable.

We are short of the October issue of this year. Who has one to spare?

Norway pine, which until lately has been neglected by Michigan lumber in favor of the softer white pine, is coming into favor with railroad car builders on account of its greater strength.

NEW ENGRAVINGS—ORIGINAL ARTICLES—OUR JANUARY NUMBER WILL EXCEL.

Report of the Building Interest of Woodland and Yolo County for 1886.

EDITOR OF THE CALIFORNIA ARCHITECT AND BUILDING NEWS—*Dear Sir:* We submit the following report of the building and improvements for our city and county as kept and corrected monthly, and may be considered as approximately right, having devoted time in collecting and care in estimating the value of all on our list; and, although the amount in comparison with last year presents a falling off, still we are gratified for having so large amount to show, it being above the average of the past six years, both in number of engagements and amount of capital invested. The following table will present the number of engagements, their kind, and value of each as substantially set forth. It also shows the work has been evenly distributed throughout the entire year, as a sure evidence of a healthy and substantial growth, which is noticeable by all citizens.

1886		City of Woodland.					Yolo County.				
Months.	No. per month.	Frame buildings.		Brick buildings.		Additions and improvements.	Frame buildings.		Brick buildings.		Total value per month.
		No.	Value.	No.	Value.	No. Value.	No.	Value.	No.	Value.	
Jan.	16	10	$10,800			4 $1,800	2	$5,000			$17,600
Feb.	17	7	8,000			5 3,000	5	13,200			24,500
Mch.	19	8	10,000	1	$ 2,000	6 3,200	3	5,800	1	$5,000	26,000
April	18	8	7,600			1 1,300	9	21,200			30,100
May	16	3	20,800			2 2,200	9	8,000	2 Imp.	800	31,800
June	14	4	11,605			4 1,050	4	5,950	2 "	1,800	20,405

Aug.	11	6	7,100	2	14,000		2	1,800	1 Imp.	500	23,400
Sept.	10	5	10,500			5 2,400					12,900
Oct.	14	8	7,700	1	4,000	3 3,000	2	2,550			17,250
Nov.	15	11	29,000	3	12,500	1 1,000					42,500
Dec.	8	4	3,900	1	2,000	1 300	2	2,500			8,600
Total	172	79	$135,205	9	$35,000	36 $21,650	39	$72,000	9	$16,700	$280,55

The preceding monthly statement, with its total footing, shows our building and improvements for the past twelve months to be—city of Woodland, 124 buildings, valued at $191,855; Yolo County, 48 buildings, valued at $88,700; final aggregate, city and county, 172 buildings, with a value of $280,555.

In scanning over our record for the past six years, we find the *average* number of engagements for each twelve months to be 104, while the value of the same is $267,934.75. With this fact in view, our most sanguine citizens cannot but be satisfied with the labors and improvements of the past twelve months.

Accept our hearty thanks for the many courtesies and favors tendered us during the past year, and our best wishes for your future welfare and prosperity.

We remain most respectfully yours, GILBERT & SON.
Woodland, Dec. 4, 1886.

Labor Fable.

A RICH man had a piece of land on which a young mule was grazing. "I shall harness you," said the man to the mule, "and make you plow this land to grow melons on, of which I am very fond, while the stalks will supply you with food." To which the mule replied: "If I consent to toil on your terms, you will have all the melons and I will be worse off than now, inasmuch as I shall have to eat dry stocks instead of the fresh, green grass. I'll not do it, sir." "How unreasonable you are," remonstrated the land owner; "your father never had any other food but thistles, and yet worked sixteen hours a day without grumbling." "Alas! that is true!" retorted the mule, "but then, you know my father was an ass."

The California Architect

Is a success in every respect, not only to its proprietor, but in the estimation and good opinion of its numerous subscribers.

WE agree that all disputes between capital and labor are deleterious to the interests of both and should be settled in an amicable spirit.

STRIKES and rumors of strikes are the order of the day in different parts of the country. There is prospect of a good fall and winter trade, providing labor troubles can be avoided; but if troubles arise there is no doubt that they will have a tendency to depress and stagnate business.

PLUMBERS should be careful not to use lead in contact with oak, unless the latter is perfectly dry and free from sap, otherwise the gallic or acetic acid in the wood will turn the lead into acetate of lead or ceruse.

Bridging.

THE object of bridging floors is not only to prevent the joists overturning, but it is principally to distribute the weight resting directly on one joist over those joists immediately adjacent, and in that way to considerably stiffen the floor as a whole. The pieces of timber of which the bridging is composed may, and do, act either as ties or struts, according to the manner in which the load is centered; and, in the case of a moving load, as of a person passing over the floor, will act alternately as ties and struts in quick succession. The strutting being placed obliquely to the joists, the strain is practically neither that of a direct tie nor of a direct strut; that is, neither simple compression nor simple tension in either case, but is in both modified by a cross strain. There is some tendency for the joists to turn over, which augments the cross strain, so that of the three stresses, the cross strain is of most importance.

Now, it is a very well known rule that the strength of a beam or a piece of timber subjected to a cross strain is directly as its breadth and as the square of its depth; and it will be obvious, therefore, that the system of placing the bridging with its greatest scantling vertical, is the proper one, and is a good deal stronger than the system usually employed. In the first system the bridging is reversed alternately, so that the pieces may butt against the joists at points directly opposite one another, which tends to further strengthen and stiffen the floor.

The only advantage in the second system over the first is that it does not necessitate a man turning round to nail the pieces alternately as he comes to them, and therefore is saving of a small amount of time. But when it is considered how much additional strength is obtained by the first method, it will be seen that the saving of time, under the circumstances, is by no means a wise economy.—*Building.*

M. MASPÉRO'S EGYPTIAN DISCOVERIES.—Among all the countries in which archæological explorations are going on, Egypt, which is the oldest, remains the most interesting. M. Maspéro presented last summer to the Academy of Inscriptions a report of his operations for the previous nine months. He has made a wise change in giving up the monopoly of antiquities which the Bulak Museum had, offering to share all that are found with the finder. The result is that now he is informed when a discovery is made, and finds the tombs unpillaged. He has, as it were, made the poachers gamekeepers. One such undisturbed tomb, besides the owner, his wife, and a large family, contained all the implements of his trade, and, best of all, the first part of the romance of "Sinuhit," a work of the seventeenth or eighteenth dynasty, of which only the second had been previously known. These romances, it is supposed, were put into tombs to amuse the leisure of the dead; the "Book of the Dead" has one chapter designed to teach the dead to play chess in the other world. The correctness of the portrait-statues of the Egyptian monarchs has received a striking confirmation. M. Maspéro presented to the academy photographs of mummies of various kings that have been unrolled at the Bank Museum, and stated that the face of Seti I. (an account of whose tomb, by the way, with over a hundred plates, has just been published as the ninth volume of the *Annales du Musée Guimet*), which is perfectly preserved, shows a wonderful resemblance to contemporary portraits of him that have been found on monuments. Such confirmation was not needed. The features of the Egyptian kings are so individual and full of character that one could not suppose they were fancy sketches. It is curious to hold an inquest on a corpse forty centuries old. Coroner Maspéro determines on examination of the body of Ra-skenen, that he died fighting. There are three wounds, one that knocked him over and two others that finished him, and traces of decomposition show that some time was lost in bringing him from the field of battle. Another case is not quite so clear. A man twenty-five or thirty years old was left in most unusual style, without any inscription. Moreover, he was embalmed as usual; the internal organs were not removed, but the exterior was covered with some matter at once fat and caustic. The body shows that the man died in horrible suffering, and the question arises, was he poisoned or was he embalmed alive? Here is a hint of a palace tragedy on which some antiquarian novelist may write a novel more sensational than anything that Ebers has yet given us.

TREVELICK made a speech in Toronto the other day and said some good things. "Lawyers are a necessary evil in a bad society and a single mechanic is worth a dozen of them." A single mechanic is worth a hundred. Reform the corrupt and oppressive laws and the lawyers will have to work for a living instead of living on the workers.

BUILDING INFORMATION FROM THE COUNTRY WILL BE THANKFULLY RECEIVED.

CARBOLIC ACID FOR CUTTING TOOLS.—Carbolic acid is recommended for moistening the tools with which metals are worked. The efficiency of the grindstone is even said to be increased by the use of acid. The dark and impure acid can be used for this purpose.

NOT long since, in an arbitration case, an engineer was thus examined as to his professional experience and capacity, so called: "How long have you been in the profession?" "Twelve years." "Are you thoroughly acquainted with your work, theoretically and practically?" "Yes." "Do you feel competent to undertake large constructions?" "Yes, most certainly." "In what engineering works have you been engaged during the last twelve years?" "The manufacture of iron bedsteads." We fear that many professed first-class men in other pursuits would make similar irrelevant replies if they were subjected to a test as to their capacity.

GLAZE your sashes with putty if you will, but make your miters and other joints without it.

HIT the nail straight upon the head and you will save many crooked blows.

HILL'S PATENT INSIDE SLIDING WINDOW BLINDS

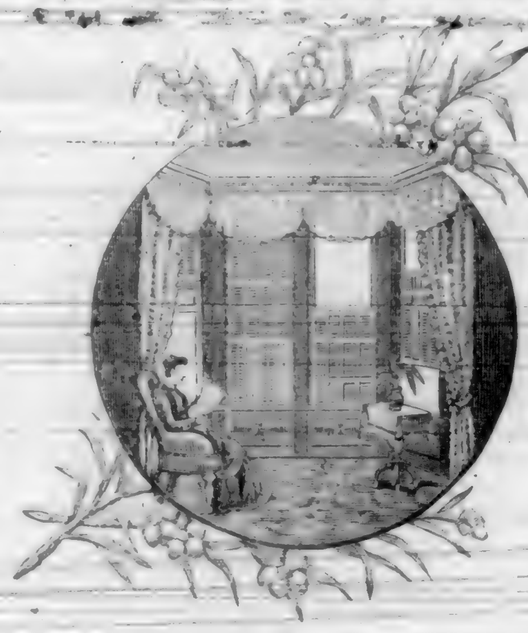
Are Adapted to Any Style of Window

And Suitable for all Buildings, Dwellings, Stores, Office Buildings, and for Houses Built to Rent, Hotels, Boarding or Lodging-Houses are Unexcelled.

THEY are entirely inside of the window casing, and while requiring no furring out or boxing, make it an impossibility to stop curtains, interfere with plants or window ornaments, or become broken by contact with chairs or other movable articles.

The light can be admitted and sunlight excluded from any part of the window; can be instantly removed and taken to any part of the house to clean, and as easily replaced.

They can be opened or closed with the window raised, and without removing articles from the window-sill, and cannot blow open or rattle. The Blind is very light (one-half inch in thickness) and strong, possessing more durable qualities than a hinged blind one inch in thickness.



THERE IS NO SAGGING, BANGING, OR GETTING OUT OF ORDER!

They are made in three sections in height (each section sliding past the others), and any number of divisions in width corresponding to the folds in the old-fashioned folding blinds. They require NO HINGES—all trimmings furnished with blinds—are MADE OF ALL WOODS, finished or unfinished, and COST LESS than old-style folding blinds. They have been extensively used by the best architects and builders throughout the East and West, and have given perfect and entire satisfaction wherever introduced.

ENGLISH AND AMERICAN VENETIAN BLINDS (IMPROVED).

The only perfect Venetian Blind in the market. The Blinds can be seen at the Mechanics' Fair. Or for samples, prices, and further information, address as below.

The following are a few of the owners who have adopted the HILL BLIND in preference to any other:—

L. M. Fabry, cor. Hayes and Laguna; architects, Miller & Armitage. John MacKenzie, cor. Grove and Broderick; architect, H. D. Mitchel. H. F. Bruns, cor. Geary and Taylor; architect, John M. Curtis. The California Architect and Building News.

VOLUME VIII — ENTERED AT POST-OFFICE, SAN FRANCISCO, AS SECOND-CLASS MAIL MATTER. ESTABLISHED JANUARY, 1879. — NUMBER 1.

THE

California Architect & Building News.

A MONTHLY JOURNAL,

Devoted to Architecture, Decorating, and Furnishing.

PRICE, $2.00 PER ANNUM.

The official organ of the Pacific Coast Association of Architects. Published by the SAN FRANCISCO ARCHITECTURAL PUBLISHING CO. No. 240 MONTGOMERY STREET, Rooms 11, 12, 13.

Subscribers will please notify us promptly of any failure to receive this journal, and also of any change in their address.

Advertisements inserted at reasonable rates.

SAN FRANCISCO, CAL., JANUARY 15, 1887.

Our patrons are informed that C. L. Crabbe has no connection whatever with this Journal. He is not authorized to make any collections, or receive either subscriptions or advertisements.

Bound Volumes of the year 1886 are now ready. We will forward a copy to any address upon receipt of $2.50.

HAND IN OR SEND

Your SUBSCRIPTIONS for 1887

To THOSE who so promptly responded to our request for immediate settlement of subscription and advertising balances,

WE SAY, THANK YOU.

To those against whose names remain unpaid balances, we say,

PLEASE PAY UP AT ONCE.

Remembering THAT—Defrauding an editor is considered one of the meanest kinds of peculation; THAT—"*Honest men are the gentlemen of nature;*" THAT—"The man who pauses in his honesty, lacks but little of the rogue;" THAT—A rogue in spirit is a rogue in gain."

Therefore,—Let every one who *receives* or *reads* this journal, forthwith forward to this office, its subscription price for 1887, and any and all unpaid indebtedness.

The Outlook for 1887.

IT IS PROMISING. True, the natural tendencies of the human mind, hopes and desires, are to anticipate and prognosticate continuance of good things, and to grasp after every appearance or indication of better; and often, the mere "wish being father to the thought," induces prophesying and predictions which have no other foundation than the desire that the thing predicted may be realized and enjoyed. False hopes are often stimulated by unreal appearances, which, logically and intelligently considered, fail of any reasonably well assured probability; hence people frequently deceive themselves, and venture out upon the merest crust of prospect, beneath which may lie almost fathomless depths of disappointment.

Fully impressed with the correctness of the suggestions made, we glance cautiously at the impenetrable future, and as far as it mysteries can be judged by the appearances and indications possible of utilization, we feel well assured in saying that the building business in San Francisco will be good during the year 1887. There are signs of encouragement in all directions, and it is safe to anticipate large activities in building improvements.

An Effort in the Right Direction.

THE responsible and better class of carpenter contractors in San Francisco, have for a considerable time, maintained an organization designed to remedy the many gross and glaring irregularities, an evil long existing in the building trade. And as we understand it, while the objects and purposes of the society are mutual protection and individual rights and interests, they are claimed upon rational, intelligent, just, and equitable grounds.

To say that the building, particularly the carpenter contracting, business, has, in the main, been run loosely in San Francisco during the past three decades or more, commencing in the early periods of this city's history, and at times since becoming most deplorably bad, with failure succeeding failure, followed by *pro rata* settlements, and discredit upon an honorable business, does not fully express the state of things that has been. The object of the organization is, to arrive at right understandings as between owners and contractors, and the establishment of such practices as will be *impartially* just between all parties. Owners and contractors have respective equal rights and equities. Neither should seek nor wish to gain undue advantage. But the fact must be admitted that the man who does honest work and pays his bills, one hundred cents on every dollar, stands but little show in competition with those who substitute wood butchery for workmanship, and settle their indebtedness at ninety or perhaps ten per cent on the dollar. And it must also be admitted that it is a most provoking and distressing attitude for men of integrity to be forced to occupy, to silently witness their chosen life avocation demoralized and abused, and the once honorable distinction of "honest mechanic," besmeared with the filth and foulness of men enjoying but limitedly, or not at all, mechanical knowledge, to an extent entitling them to recognition as "skillful workmen," and whose honesty of purposes and practices are ever contingent upon the uncertainties of either their defective or designing judgments, with no care for the often damaging results that follow.

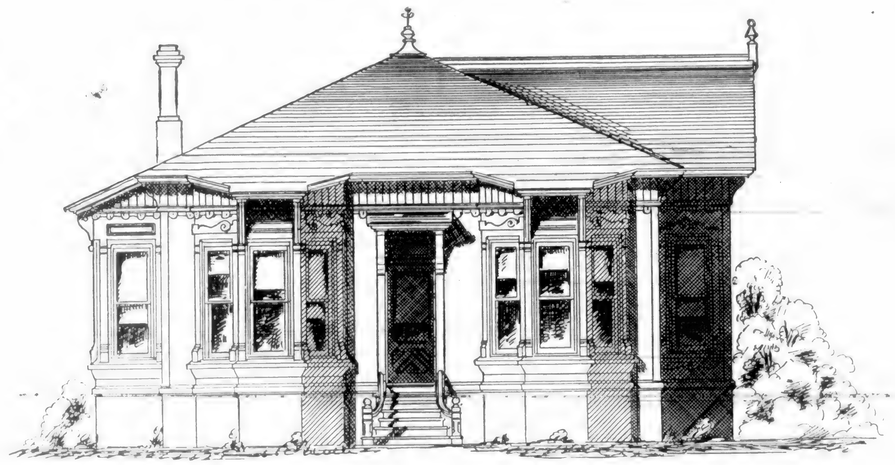
Any number of right thinking men who can combine and bring into practice methods and procedures which will abate the evils that have been and are in the building business, and bring about a bettered and improved condition of things, deserves commendation; and we hope that a generous and just disposition will be exercised by all in interest—contractors, architects, and owners alike—each of whom, being just and honest in every intent and purpose, should have but one common sentiment in reference to matters so plain of understanding as those involved in the erection of buildings.

Meeting of the S. F. Chapter.

THE regular monthly session of the Chapter was held on the 7th inst, President A. Pissis presiding, B. E. Henricksen, Secretary.

Minutes of previous meeting read and approved. Mr. Sanders on behalf of the Committee on Classes, read an interesting paper in relation to the progress of the class work, and the necessity for increased facilities in the shape of a convenient room for class meetings, as well as a permanent place—a headquarters for the Chapter. Mr. Sanders read the paper with much earnestness, and expressed the hope that erelong there would be that concert of action applied, which would secure all that is necessary to make both the class work and the Chapter grand successes. The report was adopted and ordered spread upon the minutes.

The committee on the application of Arthur M. Squires, for student membership, reported favorably, and the candidate was elected. The appointment of a committee to confer with the Board of Freeholders, in reference to a Board of Public Works and a



Front Elevation for a Conveniently Arranged Country Home.

City Engineer was suggested, and a committee of three, consisting of Mr. John Wright, James E. Wolfe, and J. Gash was appointed for the purpose.

A committee of three—James E. Wolfe, T. J. Welsh, and J. Gash was appointed to consult with a like committee from the Builders' Association of California, in reference to amendments to the Mechanic's Lien Law.

A general discussion of the Lien Law ensued, and some of its many objectionable features reviewed, showing its inequities and uncertainties, and its illy expressed intents, meanings, and applications.

The reading of a paper on ancient and modern plumbing was deferred until the February meeting.

Building Summary for January.

Considering the dull period through which this city has been passing, the statement for the current month is very satisfactory, exceeding in amount any similar period on record. Our country building interests are looking up very finely, and a great deal of work is assured to mechanics during the coming year.

In January, 1885, we reported in this journal,

73 Building Engagements, of the value of $602,585.

In January, 1886,

79 Building Engagements, of the value of $623,250.

In January, 1887,

Eleven brick buildings	$475,000
Forty frame "	160,200
Eight additions, &c	15,500

Making a total for January, 1887, of

59 Building Engagements of the value of $650,750.

COUNTRY BUILDING ITEMS.

We call especial attention to our list of improvements in every portion of the Pacific slope.

"Carpenters' Steel Square and Its Uses."

We have just received a large consignment of this practical work for mechanics, and upon receipt of $1.00 will forward a copy to any address.

OUR EIGHTH VOLUME.

With this number we begin the eighth volume of this journal. Since January, 1879, we have successfully carried on the enterprise of establishing an architectural journal on the Pacific Coast. We enter the new year full of confidence for the future, and our ambition is more than gratified when we reflect that, from a few subscribers in the start, we can boast of a larger circulation than all the rest of architectural journals combined that are published west of the Rocky Mountains. We sincerely thank our numerous patrons who have done so much to help us. Subscription price will remain the same, viz., $2.00 per year in advance.

The Best of Drummers.

There is no better drummer for business men than a well-established and reliable trade journal. It pays no railway fare, for no extra baggage, for no luxurious hotel bills, for no cigars or other incidentals usually charged up to the firm by the regular traveling man. It goes directly to the customer each and every week at all seasons of the year. It is a constant medium of friendly intercourse between the wholesaler and retailer. It tells the latter from week to week how and where he may order the latest and most attractive goods, and points out to him the most favorable time for buying and stocking up his store. The trade journal is constantly growing in importance. Its merits are being recognized more and more each year, as is evidenced by the increase of its subscription list, and the extent of its advertising patronage.

It is a common idea that a "chimney cannot be too large;" in other words, the larger the area of the flues the better the draught will be. This is not always the case. In many cases—in foundries, manufactories, etc.—where a chimney has been built large enough to serve for future additions to the boiler power, the draught has been much improved as additional boilers have been set to work The cause of this is to be found in the increased steadiness of draught, where several boilers are at work and are fired successively, as also in the better maintenance of the temperature of the flue.

An old saw-mill man explains the origin of the term "mill culls" thus: "In old times this was the class of culls that went to the mill man in lieu of a saw bill, consequently "mill culls.'"

NOW IS THE TIME TO SUBSCRIBE FOR 1887, $2.00 PER ANNUM, IN ADVANCE.

Conveniently Arranged Country Home.

On page 2 we present the elevation, and on page 3 the plan, for a very desirable and well arranged country or suburban home. The elevation is one that will attract attention from its neatness and simplicity. It is especially designed to do away with all fancy outside work. The plan is admirably adapted for a home in the country where fluctuations of temperature occur. A perfect system of ventilation can be had through the various parts of the house. In case of a hot spell, there is room enough on the side porch for a table, so the occupants can dine in the open air.

The bath-room is handy of access from several rooms, as well as being in easy communication with the outside porch. A pass slide between the pantry and dining-room closet enables the servant to confine all the smell of cooking to its proper quarters.

The front chamber is conveniently arranged for visits from "city cousins." There is ample closet room. If thought more desirable, one of the windows looking out on side porch can be changed for a door.

CARPENTERS' STEEL SQUARE AND ITS USES, PRICE $1.00

History of the Saw-Mill.

There are few tools more ancient than the saw. All the ancient nations appear to have had it; certainly the Hindoos, the Egyptians, the Greeks, and the Romans. The saw may have existed even before there were any men on earth. There is a creature called the saw-fly, with the saws in its tail, which it actually uses for sawing the stems, leaves, and fruits wherein its eggs are to be deposited. There is also a saw-fish, the long snout of which is a saw. It is said also that the original inhabitants of the island of Madeira found a ready-made saw in the backbone of a fish.

The Greeks had a pretty story attributing the invention of the saw to the accidental finding of the jaw-bone of a snake by one Talus, who used it to cut through a small piece of wood. Being a slave, and finding that the jaw bone eased his labor, he made a saw of iron, and thus gave mankind a new and most valuable tool.

The ancient saws differed from ours in two ways. The teeth were so arranged that the cut was made by pulling instead of pushing; and the teeth, instead of being set one to the right and one to the left alternately, were set so that ten or a dozen in succession were slanted one way, and the same number the other way. The ancients had several varieties of the implement. The Greeks, for example, had crosscut saws for two men, also saws for cutting marble into slabs. And they had a kind of tubular saw for hollowing out a marble bath-tub, similar in principle to the method now employed.

Among the pictures uncovered in the buried city of Herculaneum there is a representation of two genii sawing a piece of wood on a carpenter's bench very much like ours, and using a saw with a wooden frame similar to those now employed. Still more strange, the frame saw, tightened with a rope and stick, such as our street wood-sawyers use, was probably as familiar to the Romans as it is to us.

A saw-mill, however, by which wind, water, or steam is made to do the hardest part of the work, was not known to any ancient nation. Sawing by hand, next to digging a stiff clay soil, is about the hardest work that men ordinarily have to do. It is therefore not surprising that our ease-loving race began to experiment a good while ago with a view to applying the forces of nature to the performance of this toil.

A learned German investigator, who has investigated the subject very thoroughly, states that the first trace of the saw-mill yet discovered is in the records of the German city of Augsburg for the year 1337. The reference is slight, and does not fix the fact with certainty. But there are two saw-mills near that city which are known to have existed as far back as 1417, and they are still used. Before that valuable invention, all boards and planks were split with wedges, and then hewn to the requisite smoothness with the ax. The splitting of boards is still practiced in remote settlements, as I myself have seen; and it is recorded of Peter the Great, of Russia, that he had much difficulty in inducing the timber cutters of his empire to discontinue the method. At length he issued an edict forbidding the exportation of split planks. Even in Norway, covered w th forests as it was, there was not one saw-mill before 1530. Nowhere in Europe, it appears, was the introduction of the saw-mill so long resisted as in England. In 1663 a Hollander erected one in London; but it brought upon the poor man such an outcry and opposition that he was obliged to abandon it. The sawing of timber by hand furnished occupation, at that time, and long after, to large numbers of strong men. In every town there were saw-pits, as they were called, for the convenience of the sawyers, one of whom stood at the bottom of the pit and the other on the log. We can easily imagine that when every beam, plank, and board, thick or thin, had to be sawed by hand, the sawyers must have been a formidable body, both from their numbers and their strength.

After the failure of the Dutchman in 1663, there was no serious attempt to start another saw-mill in England for more than a hundred years. In 1767, an English timber dealer of large capital built a saw-mill to be moved by the wind. It was thought to be a great and difficult enterprise, and it attracted much public attention. Some years before an author had explained the advantages and economy of saw-mills; then the Society of Arts gave the scheme of building one their approval, and finally the mill was actually built by an engineer who had studied the saw-mills of Holland and Norway. No sooner was the mill complete than the sawyers assembled in great force and tore it to pieces. The Government compensated the owner for his loss, as was just. Some of the rioters also were convicted and imprisoned. A new mill was then built, which was allowed to work without molestation, and proved so profitable that others were soon introduced.

Closet Ventilation.

A NEW JERSEY architect claims the distinction of being the first house-designer to ventilate clothes closets, and this fame-making act was performed in the year of grace '86. Some of our readers may contest the claim, but we are compelled to admit we have never seen a ventilated clothes closet in a private dwelling, although we have long been in search of one. Seriously, this failure on the part of architects is a matter of grave importance, and when it is considered that no cost is attached to the obtaining of what all admit the necessity for, the continued neglect of architects in this respect is past accounting for. The St. Paul *Farmer* has been publishing a series of excellent articles on common sense in building, and while it emphasizes the housekeeper's demand for closets, it forgets to ventilate them. It says: "So, in planning a home, the ladies' wishes must be attentively considered, 'first, last, and all the time.' Generally the first demand is for closets large and closets many, closets dark and closets airy, closets here and closets there—closets everywhere! But though closets may be classed in the category of those good things of which it is difficult to have too many, still they are to be kept judiciously in the background, filling space which would not otherwise be of much use, as at the end of halls and in 'half stories' in the low space under the roof at the side of rooms. For instance, if the wing of a house is sixteen feet wide, and the walls run up but three feet above the second floor level, leaving the ceiling to slope from that height upwards, the space near the walls is of very little use in a room. But if three feet be taken off for a closet at each side, then there results a room ten feet wide, with side walls high enough for most purposes in a bedroom, and with two good closets, or one of the closets may be entered from another room or hallway."—*Ex.*

[We print the above merely to show the errors in the article to those acquainted with facts. Plans are on file in this office that are nearly a quarter of a century old, showing plainly the ventilation of closets by means of a hole in the ceiling covered with wire cloth, and having direct communication between the joists with the outside air. How anyone can have the cheek to claim a *new* invention in '86 that is of almost ancient origin, is an insolvable mystery.—ED. ARCHITECT.]

In no part of the world, probably, has the saw been more minutely and curiously developed than in Great Britian, where they have saws so fine as to cut diamonds, and circular saws nine feet in diameter and a quarter of an inch thick. They have also veneer saws so accurately adjusted as to cut eighteen slices of veneer from a rosewood plank an inch thick. In London they will put a log of mahogany upon the mill and cut it into slices so thin that the sawdust weighs more than the veneer. Yankees have beaten this performance. They take a piece of mahogany or rosewood, soften it by steam, and cut it into veneers with a knife, without making a grain of sawdust.

Daniel Webster tells us that his father had a saw-mill after his removal to New Hampshire, at the source of the Merrimac River. Daniel, who was by no means fond of labor at any part of his life, liked nothing better in his boyhood than to attend this saw-mill, because when he had put his log in position and started the saw, he had sixteen good minutes for rest or reading before the business required further attention.—*Journal of Progress.*

And we may further add that it is a part and parcel of the history of the successful saw-mills on this coast that they have been supplied with saws made by the works under the control of Messrs. Spaulding, Patterson & Sheffield, and known as the Pacific Saw Manufacturing Co., Nos. 17 and 19 Fremont Street, San Francisco. All the saws in the mills are supplied with the patent Spaulding inserted teeth. The one fact that it is the successful mills that have used these saws, should induce every proprietor on the Pacific slope to at once replace their old-fashioned saws by the splendid new manufactures of the Pacific Manufacturing Co.

A 4x8 billiard table requires a room not less than 13x17 feet.

A Simple Rule for Measuring Straight Logs.

THE *Southern Lumberman* says an experienced log and lumber inspector gives the following short and easily remembered rule for ascertaining the contents of a log by Doyle's rule when a copy of Scribner's book is not available:—

RULE.—Square the diameter of the log after subtracting 4 inches from it, and the result will be the exact contents in inch boards of a log 16 feet long. A log 8 feet long will be half this amount, 12 feet long three-quarters, 14 feet long seven-eights, and so on.

OAK may be darkened by exposure to the fumes of ammonia in a close box, but if the work is first oiled with linseed oil and wiped dry with a cotton or linen cloth, and then a solution of bichromate of potash (say half ounce of potash to one pint of water) be applied, it will darken it and not raise the grain, either of oak, mahogany, or cherry. Care, however, must be taken that the work is not made too dark by too many applications of the solution.

EVERY ARCHITECT SHOULD TAKE A PRIDE IN BEAUTIFYING THIS JOURNAL.

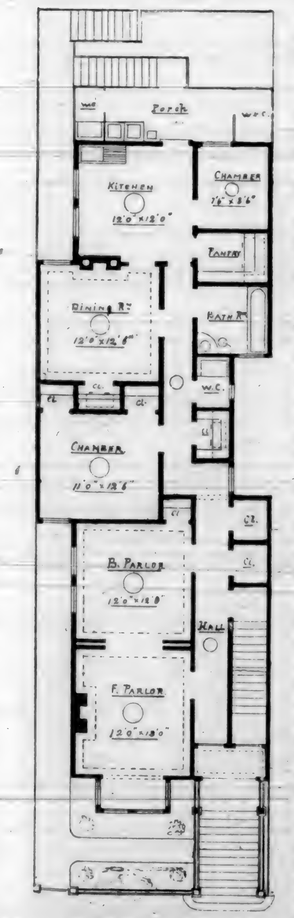
Design for City Flats.

[The accompanying elevation and plans for city flats were prepared by Mr. Salfeld, architect, 216 Kearny Street. We append his personal description of the same. In future it will be the aim of the editor of this journal to secure the best talent available for illustrations of houses of every conceivable design and form.]

WE present on this page a design for two flats in the Eastlake style of architecture, the first containing six rooms and the second seven. With the exception of a hall bedroom on the second floor, and one or two closets on the first, the two plans are designed nearly alike, and one description will answer for both. The elevation has a graceful and picturesque effect, and is cheap and economical in construction. The architraves of the bay-window and entablature over portico are supported by small turned columns, unique in design, and very pretty and attractive. The columns of the porch are turned with octagon cap, faced with small rosettes. The frieze of the entablature is constructed with turned balusters, with ornamental scroll work, and blocked bed mould above. The projecting gable over bay-window is finished with turned rosettes, fancy shingling, and moulded cornice. The light and airy exposure, convenient arrangement, closet accommodations, etc., of the spacious rooms, can readily be seen by referring to the floor plans. The halls extend through the building, thus affording communication with any of the rooms without passing through others. In the hall of the first story are two large closets, and a flight of basement stairs, with door opening into hall, is constructed under stairs leading to second story. The basement is seven feet and six inches high, planked and partitioned off into cellars and other rooms. The rooms are well proportioned, provided with commodious closets, and all other necessaries required by a family who appreciate the conveniences of a model home. We wish our readers to understand that a plan is the main consideration in building, and that an elevation can be changed into any style to suit the taste of the owner, therefore we devote more time and space to the study and description of the plan, knowing it to be most important.

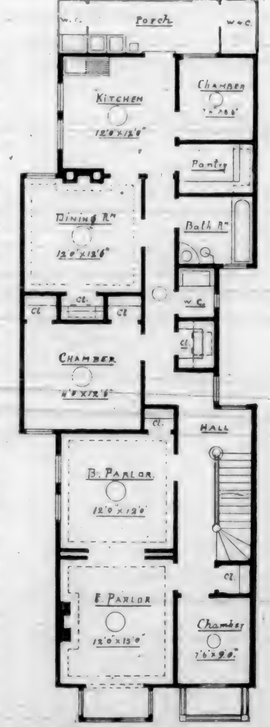
Elevation

[The above is from a new California work entitled, "Country and City Homes." It contains eighty pages of designs for all classes of buildings, and is sold for 50 cts. a copy. We will forward one to any address upon receipt of the amount.—ED.]



FIRST FLOOR PLAN.

THE policy adopted by some large employers of labor of discriminating against members of trade unions and labor organizations in engaging hands is, in our judgment, the most unwise which could be followed. The workmen may be induced to form an alliance with employers for their mutual advantage, but they become restive and intractable when an effort is made to deprive them of their rights. The true policy of the employer is to make no distinction between union and non-union men, and to refuse unconditionally to aid the unions in compelling those who prefer independence to join them. The employer who consents to discharge good men because they will not join the unions and submit to the fines and penalties usually imposed upon them for not having joined sooner, places himself completely under the control of the worst elements of organized labor, and has no reason to expect fair or just treatment at their hands. In dealing with workingmen a little tact usually accomplishes more than a great deal of bluster and obstinacy. For example: Not long ago a manufacturer employing more than a hundred men was waited upon by a committee of the union to which a majority of his workmen belonged, and was told that it would be necessary for him to discharge ten non-union men in one of his departments. To have refused unconditionally would have led to a strike, entailing serious inconvenience and loss. After considering the matter for some minutes, he replied: "Well, boys, this is not a good time to quarrel. I am running fuller than the state of the business warrants, and have been thinking of reducing my force. At the end of the week I shall have to discharge twenty men. These will include the ten non-union men you object to, and I will leave it to you to pick out the ten union men I am under the necessity of parting with. Whenever you are ready to report your list of names I will notify the twenty men that I shall not have work for them after Saturday." The committee reported back to the union, but the list was never furnished, and the non-union men are still at work. The alternative presented to the committee was a perfectly fair one, and it carried vastly more weight than argument or angry contention. The manufacturer's interest is to "show fair" in the struggle between independent labor and labor controlled by the unions, and if possible to ally all in his employ so closely to himself by the ties of self-interest that there will be no inducement to take shop questions outside the shop for adjustment. Whether a man belongs to a union or not is a question with which the employer has no occasion to concern himself.—*Carpentry and Building.*



SECOND FLOOR PLAN.

INCREASED PATRONAGE WILL ENABLE US TO MAKE STILL FURTHER IMPROVEMENTS.

ASKED, ANSWERED, AND COMMUNICATED.

☞ Architects, Contractors, Carpenters, and Mechanics generally are respectfully requested to furnish us items of interest for this column. We will gladly answer any and all questions pertaining to the architectural and building interests. If illustrations are necessary to explain your ideas, send us a sketch of them and we will make the cuts.

Free to All.

THE columns of this journal are open to all who differ with us upon any subject presented. We are too old in years and experience to assume that we have passed the reef of human liability to err, or for one moment to suppose that we have reached the realms of thought where perfection reigns supreme. But this we do assure—that whatever of error there may be contained in our columns will be speedily corrected, as soon as attention is directed thereto, and we are convinced of the error. We will give place to a reply in any case, when a mistake or wrong statement has occurred. It is our desire and purpose to be fair, just, and correct in all things, and do no person or subject any violence. We therefore invite free discussion and criticism, and again state that the columns of this journal are at the service of all who desire to differ with us upon any theory or subject, or who take exception to anything at any time appearing in our columns.

WE intend to make a specialty of this department of our journal, and, in order to make it thoroughly interesting, we desire the co-operation of all architects, mechanics, etc., whether subscribers or not. In this column there is a great opportunity for comparison of ideas on the practical questions of the day; and we hope to receive from those interested, and especially amongst builders, questions arising in their daily practice. No matter what may be the solutions given to the various problems presented, we shall only be too pleased to receive replies from our readers, where they see other and better solutions for them. If a general interchange of ideas can be brought about, great advantages will ensue to all. Let not a month go by without bringing up for discussion practical topics in the architectural, mechanical, or scientifical pursuits. We desire a general expression of opinions, for or against, of every article presented by us. Every communication will receive deliberate and careful consideration.

EDITORS ARCHITECT: I noticed in your December issue that Mr. D. Bink was in trouble, and had applied to you for information in regard to a rule to mark out the top and bottom cut of a sloping brace of square timber, with the diagonal corners standing vertically over the opposite. In answer, I offer the following:—

1. To a man that can make all the cuts and bevels necessary for framing a hip roof. If you compare the top end of the brace with the ridge and valley rafter in a roof, you will readily see that they are the same. So if you take a square stick, say a 4x4, it will form a $\frac{1}{6}$ pitch. If the brace is set at an angle of forty-five degrees, you get the bevel thus:—

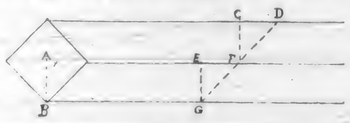


FIG. 1.

Take one-half of the diagonal width, as at A B, and measure this distance along the edge of the stick, as at C D. Square over to the other and join D F. Measure as before, making E F equal to C D. Square across timber again, and join F G.

2. For a simpler way, that will suit all braces and at any angle, take a piece of timber and mark as above. Suppose you have a 4x4 to be cut, say 6 feet from a post, and run up on the post 8 feet 6 inches. Lay your square on the lines laid down thus:—

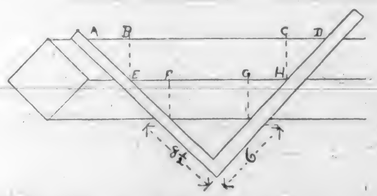

FIG. 2.

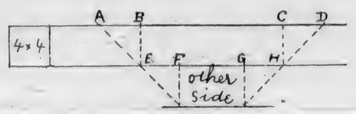

FIG. 3.

Transfer the distance A B in figure 2 to the side of the timber in figure 3. Square over to the other edge, and join the angles as before; then cut.

Another way: Take your square and find the distance across from $8\frac{1}{2}$ on one arm of the square to 6 on the other, same as for a common rafter. This distance will mark the side, using the line formed by the arm of the square with the 6.

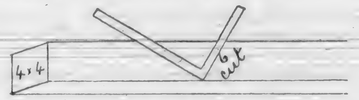

FIG. 4.

Cross over on the other side and cut.

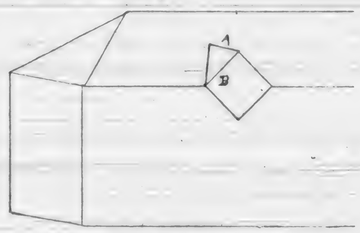

FIG. 5.

A B represents the ridge or edge of the 4x4; the line to the left of B the valley or side of the 4x4. It will be noticed that the ridge A is one-half the width of the width B.

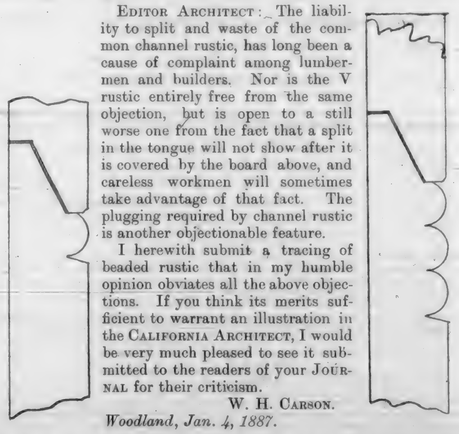
Of course if my propositions hold good, and practical experience has so proven them, any distance can be used instead of those given, by applying the instructions given.

Yours truly, B. MCMANUS.

Oakland, Dec. 29, 1886.

[The above is one of several answers received in regard to the inquiry of Mr. Bink. We thank its author for the interest shown, and trust that all of our mechanical friends will emulate his example. We will be pleased to hear from those who make a practical demonstration of above theory in regard to the correct working of the principles advanced.—ED. ARCHITECT.]

EDITOR ARCHITECT: The liability to split and waste of the common channel rustic, has long been a cause of complaint among lumbermen and builders. Nor is the V rustic entirely free from the same objection, but is open to a still worse one from the fact that a split in the tongue will not show after it is covered by the board above, and careless workmen will sometimes take advantage of that fact. The plugging required by channel rustic is another objectionable feature.



I herewith submit a tracing of beaded rustic that in my humble opinion obviates all the above objections. If you think its merits sufficient to warrant an illustration in the CALIFORNIA ARCHITECT, I would be very much pleased to see it submitted to the readers of your JOURNAL for their criticism.

W. H. CARSON.

Woodland, Jan. 4, 1887.

TO FIND the weight of round iron per foot, square the diameter in quarter inches and divide by six; the quotient is the answer, and very near the actual weight.

IT is sound business policy to patronize the liberal advertiser. He has confidence in his goods, or he would not risk his money in advertising them. He can sell cheaper than a non-advertising competitor because he can manufacture in large quantities and get material at lower prices.

FOR attaching mouldings and other light lumber, a new kind of nail has been contrived, which leaves no nail-holes. It is made with a point at each end and with an outwardly projecting head or shoulder midway between the points. The nail is first driven into the wood by means of a punch which straddles the protruding point and bears on the head. When enough have been driven in, the moulding is placed over the nails and driven down.

IT has been ascertained that timber which has been floated in water for a considerable time is no longer liable to the attack of dry rot. The albumen and salts are slowly dissolved out, thus depriving the fungus of the nutriment needful for its development. A French experimenter has shown that fresh sawdust rots away in a few years in damp earth, whereas sawdust from which the soluble matters have been soaked by water, remains unchanged under like circumstances.

THE question of how to prevent checking in the ends of timber when it is being seasoned is engaging the attention of English engineers. According to a recent report, it has been ascertained, after trying a number of expedients, that by painting the ends of the timber with thick glue several kinds of lumber can be dried without checks. It is supposed that the glue penetrates far enough to cement the layers of the wood together near the ends, and thus keep the ends from drying faster than the rest of the wood. Of course this method requires seasoning under cover, since rain would have the effect of dissolving the glue.

POWDERED glass is largely taking the place of sand in the manufacture of sand-paper. It is readily pulverized by heating it red hot and throwing it into water, the finishing being done in an iron mortar. By the use of sieves of different sizes of mesh the powder can be separated into various grades, from the finest dust to very coarse, and these should be kept separate. A strong paper is tacked down and covered with a strong size of glue, and the surface covered with powdered glass of the desired fineness; when the glue is dry the surplus glass is shaken or brushed off. Muslin is better than paper, and lasts much longer in use.

THE blistering of paint upon wood is not, as is generally believed, the direct effect of heat upon oil in the paint. If it were, we should find it taking the same action upon iron or plaster, which, we need scarcely say, is not the case. Heat, in the case as above noted, is a secondary agency, the primary one being steam, generated from the moisture in the porous wood, below or behind the impervious face or coating of paint. It is truly speaking a blister; but it is also a blow, expansion or cavity caused by the generation of steam. Blisters formed on wood, if cut or pricked at an early stage, so as to let out the steam, may be erased by carefully rubbing them down to their original bed, especially so if separation has taken place on the face of the wood, in preference to the face of the priming, or first coat of paint.

Wooden Bolts.

THE following article from an exchange on the subject of wooden bolts will doubtless prove of interest to our readers:

"Why do you make so lavish a use of nails in the carpenter-work of our houses, to the exclusion of the honest, old oaken pin? Pull down any building, if it be merely a barn, more than two hundred years old, and you will not find a single nail in the original work; rafters and joists were all bolted together so stoutly as almost to defy the tools of the destroyer. Many an old manor barn, when pulled down of late years—as, unfortunately, only too many of them are—has shown itself to have been better built than most palaces are now. There are arguments in the way of economy of time, and so on, in favor of the use of nails in house building, but they are as nothing compared with the solid advantage of using wooden bolts. The iron nails in time canker and rot rafters and floors, but bolts hold them together 'like grim death,' and render a house practicably indestructible."

THE ash is one of the most valuable of trees. Its timber is elastic, tough, and durable. It is called the "husbandman's tree," on account of the great variety of household and agricultural implements that are made of it. It used also to be called "the martial ash," because weapons of war were formed of its light, yet tough wood.

RECENT inquiries show that among the 20,000 carpenters in London, the expert workers average only eighteen cents an hour, while the inexpert get only twelve cents. Carpenters in Paris can only earn $1.70 for ten hours' work; in Berlin they work only eight hours a day for $1.05 per day, and are out of work on the average three months in the year.

THE latest example of "Queen Anne," or nondescript architecture, is furnished by the Philadelphia Mint, the superintendent of which, in order to obtain more room, and in the absence of ground to build upon, added a roof story, putting a French mansard on a building of pure Grecian architecture. *Engineering News* dubs the new style Franco-Grecian.

"MOONLIGHT nights are the bane of railroad engineers," recently remarked a head official of the Baltimore and Ohio Railroad. "All engineers dread moonlight nights. They try the nerves to the utmost. Engineers like to run on dark nights. On a moonlight night the trouble with them is no trouble at all—shadows. An engineer, looking out from his engine, sees before him all manner of shadows. He is sure that the dark shadow across the track he sees is a man, or a rock, or some kind of an obstruction. He doesn't know, and he is kept in a state of nervous excitement all the time. Going around curves, along hillsides, many curious shadows are outlined on the track; and very often an engineer is so worked up over a night's ride that he is scarcely able to perform his duties."

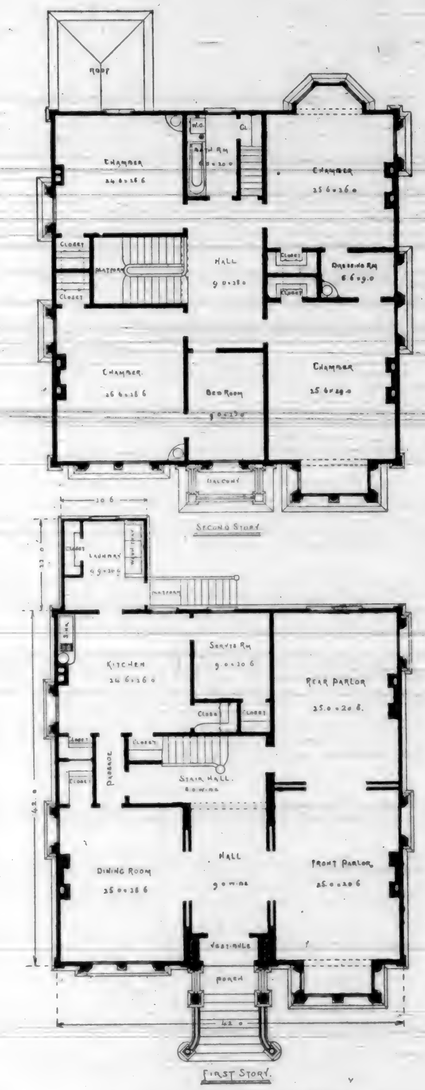
Built-up Doors.

A FEATURE of the building trade is the extensive use that is made of veneers. The method of building up doors of strips of pine has tended directly to this result. The built-up door, made of strips of pine glued together, is stronger than any other kind, at least of equal weight, and will not warp. But it necessitates the use of veneers of some kind. For heavy doors, quarter-inch stuff is used; but for the smaller doors in residences, one-eighth inch is often considered thick enough. The kind of wood depends on the finish of the room. Mahogany, cherry, oak, and curly or bird's-eye maple are perhaps the most common. This method of construction is particularly valuable where the opposite sides of doors have to be finished differently, to correspond with the rooms which they respectively face. This has often been done by making the door of two layers generally of equal thickness, the unequal shrinking and swelling of which would twist the door, and often tear it to pieces. The objection is raised against veneering that it is dishonest, and so not true art. That criticism should never be made in regard to such work as that mentioned. The built-up door of pine, veneered with mahogany, costs about as much as one of solid mahogany, and is a better one.—*Ex.*

Have a Specialty.

THE following from an exchange is well worth reading:—

"Many persons fail in achieving their ends, for the reason that their efforts are too diffused and cover too much ground. In engineering, the details are so great, and the fields so vast, that many may be specialists without coming in direct conflict with each other, and the man who knows one thing well, instead of many things superficially, is always in request. Special information, provided it is thorough, is always better paid than general information, that skims the surface and leaves the depths untroubled. In these days of technical papers and encyclopedias, the average reader can know a little of many subjects, but it is notorious that a little knowledge is dangerous, and, we might add also, that it is useless. The versatile man is generally an inefficient one, and, while he may be interesting as a companion, or to while away an hour in gossip, he is of no use in mechanical emergencies. Where would the versatile man be in certain of these, which often arise in the profession? From the necessity of his calling, an engineer may know and be well informed on a great variety of technical matters. He must know these thoroughly or indifferently, according to his desires, but this does not prevent him from making a study and investigation of some particular line or subject."



A Convenient Country "Box."

THE accompanying plan is an admirable one for a country or suburban house. It will repay careful study. Prepared especially for this Journal, by James E. Wolfe, architect.

The Architectural Draughtsman.

NUMEROUS inquiries have reached us from time to time from persons anxious to acquire a knowledge of architectural or mechanical drawing, asking us to indicate a course of study which, while being thorough, should not be too extended. Some of the inquirers wished to gain a knowledge of the subject for the purpose of making it a profession, while others desired to learn something of it for the purpose of assisting them in their trades.

The investment of time occupied in learning architectural drawing is almost certain to prove profitable. A mechanical draughtsman who is fairly well educated in other respects is nearly sure of finding employment at a fair salary in almost any town of size, for where there is a town there will be building going on, and the services of a draughtsman needed in getting out the drawings and plans. Even in comparatively new settlements, the services of a man who can make working, and other drawings, are generally in more or less demand. Draughtsmen and designers are required in nearly all the mechanical trades,—in the manufacture of silk, woolen and textile fabrics, paper-hangings, lace, carpet, and floor cloths; in fact, it is scarcely too much to say that there is not a mechanical art in existence in which the services of a draughtsman are not either directly or indirectly required.

It is a most erroneous idea to suppose that so long as a man can "draw to scale" he is entitled to call himself a mechanical draughtsman. To become justly entitled to such a term, a course of study of no mean order is necessary. First, we have geometry, which is the real basis and foundation of all mechanical drawing, and a knowledge of that subject is therefore absolutely essential; but a man who wishes to become a good draughtsman must go far beyond that. In the course of his vocation it will frequently happen that problems will arise needing a very intimate knowledge of the principles and practice of orthographic projection for their solution, so that he must make himself acquainted with the subject in a deeper and more extended manner than would be sufficient for the preparation of simple plans.

Then besides a good idea of coloring, and an artistic filling in finishing off drawings, a draughtsman should know something of isometrical projection. Take the case of farm buildings. Probably there is no simpler and clearer way of giving an accurate idea of the extent and arrangement of the agricultural class of buildings than to make the drawings in isometric projection, showing the plans and elevations in one view, and at the same time permitting perfectly accurate measurements being taken from them. The system is simple and very easily acquired, and is of great practical advantage in many other ways. Then perspective drawings are required, and a knowledge of that subject is necessary. The ordinary plans and elevations of a building prepared for working from are not sufficient to give an accurate idea of it to persons unaccustomed to such drawings. As a matter of fact, an elevation is a drawing of a building as it is, and not as it appears, and on that account it is desirable, when preparing drawings for a client, to show them in perspective. The art displayed in the coloring and finishing of such a drawing will do much in helping a man to decide upon the eligibility of a design for his purpose. Many architects, in designing the external portions of a structure, remembering this fact sketch their rough designs in perspective, from which they obtain a much better idea of the final appearance than they could possibly get from the ordinary plan and elevation.

What is sometimes termed "free-hand" drawing, that is, drawing without the aid of instruments, is very necessary to a good draughtsman. There is scarcely a drawing, large or small, in which some detail or other has not to be put in by hand, and the neatness of the drawing, as a whole, will largely depend upon the accuracy with which this is done. In the best perspectives the lines are first set out to rule in pencil, and are afterwards inked in by the unaided hand. In this way the stiff and conventional appearance of ruled drawings is avoided. Again the draughtsman must be able to work freely with his unaided hand, in order to put the lettering in neatly. It is surprising how many drawings are spoiled in appearance by the slovenly and inexact manner in which the lettering is done. On even, well-executed drawings it is not at all uncommon to see the lettering put in, as far as possible, by mechanical help, all the straight lines being ruled, and the curves put in with the compass. This practice is to be condemned, because the letters drawn in such a way will always have a stiff and inartistic appearance, while the very obvious manner in which they were drawn can scarcely redound to the credit of the draughtsman. In finishing off all drawings, excepting, perhaps, highly finished and elaborate perspectives, and other drawings of much importance, many architects only take the trouble to write the various titles upon the drawing, whilst others stamp them on with a rubber stamp, or stencil them on with special stencils made for the purpose. All these methods are equally objectionable. With a little practice anyone can learn to put in the lettering by hand almost as quickly as stenciling or stamping. For ordinary working details, and other purposes where a comparatively rough style of lettering suffices, the upright engrossing style answers very well, as it looks neat and is quickly executed. In ordinary "printing" letters it is usual to fill in each letter with a fine-pointed pen. This method, although probably the best where extreme accuracy is required, occupies too much time in ordinary cases. We therefore recommend students to try the use of the "inking in" pen for the purpose. It should be held in the hand in the same way as a pencil, and each stroke of a letter be traced with one movement of the pen. In working upon a smooth-surfaced paper or tracing linen, this method is of great advantage, as all

(Continued on page 10.)

PLAN FOR COUNTRY HOUSE. (See opposite page.)

the parts of the letters are of one thickness and uniform throughout, while the time occupied is little more than that taken in writing the word in the ordinary way.

Those who are deficient in the art of free-hand drawing will find the following an excellent system of practice. The object is to render the hand free, and to train the eye in accurately judging distances. Obtain a blackboard and a piece of chalk, or, in the absence of these, a sheet of rough paper—a newspaper answers the purpose—and a soft pencil. Then take chalk or pencil firmly between the finger and thumb, and rapidly draw a curve of some kind, moving the hand and arm from the elbow, and not from the wrist. Draw a number of curves in the same way in all directions, taking care not to sketch them, but to trace the whole curve with one movement of the arm. Then draw a number of parallel lines in various directions—horizontal, vertical, and oblique—and then draw fresh curves joining onto the straight lines. This is literally to "get the hand in," and a half an hour's practice occasionally will be of considerable benefit. The student may afterwards proceed to make upon paper careful copies of free-hand drawings, choosing at first figures of simple outline, such as the outline of a vase, or a number of curves meeting at a center and forming some kind of a design. The method in this case will be entirely different from the blackboard practice. Lightly sketch vertical and horizontal guide lines, mark off upon them points where the figure intersects, and then lightly sketch in the outline through these points, and, when satisfied as to the accuracy of the figure, complete with a bold, even, and continuous line. Remember that the distances must all be judged by the eye alone, and the use of rule or measure never be resorted to. After having become somewhat proficient with this class of figures, the student may next proceed to take more difficult copies. The designs for terra cotta, and other ornamental panels and belt courses taken from the manufacturers' catalogues, can be easily obtained, and will answer the purpose admirably.

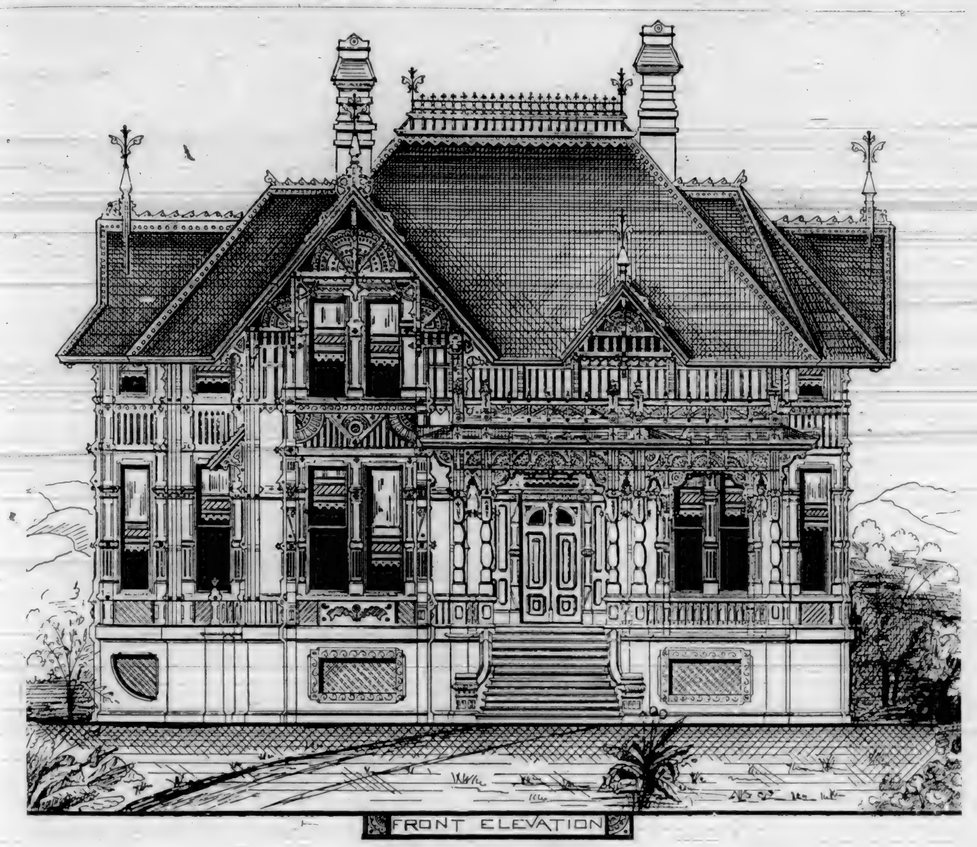
The subject of coloring is important. Many a good drawing has been hopelessly spoiled by indifferent coloring. In most cases the colors required are simple washes, but it is quite necessary that they should be perfectly uniform. To obtain a flat, uniform wash, the drawing should be placed on a board, which should be slightly tilted. A full brush of color should be taken each time, so that there is always a little pool of color upon the paper until the bottom is reached, when it will be gathered up. The secret of obtaining good flat washes is to keep the colors very thin, that is, to add plenty of water to them. If the color is too thick it will not flow readily, and it dries too quickly to make it possible to obtain a flat and uniform wash. In cases where a deep flat wash is required, it may be easily obtained by giving the drawing several washes, one on the other, of course allowing each coat of color to dry before another is added. The colors used should be of the best quality. It is absolutely impossible to obtain a satisfactory result with inferior colors, no matter how skillfully they may be applied Those imported and manufactured by either of the firms, Newton & Windsor, Rowney or Reeves, are among the best.

In conclusion, we would urge the would-be draughtsman to make a systematic study of the subjects above mentioned, to practice regularly and constantly, and to acquaint himself with the technical details of the art he proposes devoting himself to. If architecture, then the construction of the various details of building, making himself perfectly familiar with the various technical terms, and obtaining at least some considerable knowledge of the orders of architecture. Remember that absolute accuracy is not only essential to a good drawing, but that an error or a mistake of any kind in the plans may be productive of the most serious consequences when the building is actually erected. A case in point is within our recollection. A draughtsman, in drawing out the plans for a certain building, omitted to show a window opening onto a light shaft. The plan from which the omission was made was of the second story and four upper stories, which were all alike. There were six houses being erected from the same designs, so that the simple omission of four lines from the drawing meant the omission of thirty windows altogether. The joinery used in the houses was supplied by a firm under contract for the whole quantity, and they of course declined to supply these windows, as they were not shown on the plans, and they had not therefore allowed for them in their estimate. A clause in the contract to the effect that every article of joinery necessary to properly complete the buildings should be supplied whether shown upon the plans or not, caused the owner to affirm that these particular windows were obviously necessary. Upon this, however, they could not agree, and litigation was the result, all caused by a small act of carelessness on the part of the draughtsman. Probably the best way to avoid errors is to carefully go over the drawings, after they are finished, in the most minute manner, and to check every detail and item. If the specifications are then prepared without reference to the finished drawings, and the two are afterwards compared, errors will be avoided as far as possible. ARTUS.

A Popular Journal.

THAT this journal is extensively read, and its contents duly criticised, is proven by the fact that an error, which was shown in one of our plans not long since, has been the subject matter of twenty-nine communications received at this office in regard to the blunder. Who will say that this is not the best advertising medium on this coast, when even a little error is so extensively noticed. Terms for advertising are so reasonable that our pages should be filled with notices from those having wares in the building line to dispose of.

BOUND VOLUMES OF 1886 ARE NOW READY. PRICE $2.50 EACH, POST-PAID.



DESIGN FOR A COUNTRY HOME.

Design for a Country Home.

WE are indebted to Messrs. S. and J. C. Newsom for the above elevation and the accompanying plan on opposite page. The arrangement is one that recommends itself to the lovers of a well-planned house. The elevation will suit those who desire a very showy house, without appearing too gorgeous.

Downing a Redwood.

NOW she takes it! Keep clear!" shouted Jim Lake, a muscular Sonoma "bull-whacker," in warning to the group of woodchoppers in the redwood forest at the northern end of the San Francisco and North Pacific Railroad, as the death-rattle of a California giant was heard. After hours of under-cutting and cross-sawing, they had cut through all but one and a half inches of the monstrous trunk, fifteen feet in diameter, and the cracking of the wood announced that the monarch was about to fall. Its lofty top, 275 feet above the ground, wavered a moment, and bowed gracefully and with a stately air, like a grand lady courtesying; then gathering impetus as it left the perpendicular, the great trunk rushed to the earth with terrific force. Keeping to the course marked out for it by the woodsmen, it tore the foliage from the protruding limbs, filled the air with flying branches and bits of bark, swept away every article in its path, and descending with tremendous force, struck the ground with a thud to be heard a mile. Clouds of dust shot up sixty feet; the earth shook and rumbled. The prostrate giant trembled once from top to stump, and all was over. It was a death-scene of awful grandeur and solemnity. Even the lumbermen, accustomed to the sight daily, dropped their sledges, double-bitted axes, mauls, goads and water buckets, and gazed in silence at the overthrow of the many-centuried monarch.

SOMETIMES an elevator brings a man nearer heaven than he wants to go.

Just Published, "Modern Architectural Practice."

THE initial architectural publication for 1887 has been received. It is from the well-known architectural book publisher, W. T. Comstock. The full title of the book is "Modern Architectural Practice," No. 1. A large country house. Bruce Price, architect.

In this work the author presents the full plans and details for a large building to be erected in San Mateo County, Cal. The general design is calculated to represent the "American style" of architecture. The author tersely remarks in the preface: "In handling the problem no style has been followed, for no style could be attempted in its purity. It would answer equally the assertion that 'it is French in its feeling,' 'Romanesque in its handling,' or 'Dutch in its mass,' still it is an American house, planned for American uses, and built of American materials. Its disposition of rooms is new to any style of the past, yet the wants of the cliant have been fully met, and upon them it has been built."

The book is handsomely bound, printed on heavy paper, and contains twenty-four 12x15 plates, and full specifications illustrated by wood-cuts and diagrams, showing special features of construction; containing a large variety of doors, windows, and finish, wainscoting, paneled ceilings, staircases, balustrades, mantels, sideboard, pantry, bath-room, and laundry fittings, and other interior details; also exterior details, giving full and complete drawings of stone work, carved work, porches, main entrance, entrance doors, outlines of mouldings, gables, bay-windows, porte cochére, and all other details necessary for a full and complete understanding of the work. The price of the work has been placed at $5.00, upon receipt of which we will forward a copy to any part of the country.

SET out your work with accuracy, and the time you will save will bring profit as well as credit to your employer and yourself.

NEW ENGRAVINGS—ORIGINAL ARTICLES—EACH SUCCESSIVE NO. WILL EXCEL.

COUNTRY
BUILDING INTELLIGENCE

In this and succeeding issues we intend to devote considerable space to information in connection with buildings, from every portion of the coast.

Only reliable news will be found in this column. Our custom has been for the past eight years, to furnish only data which could be relied upon. We will not publish rumors of "THIS AND THAT IS GOING ON" unless we are reasonably assured that such is truly the case. We have been busy the past two months in perfecting arrangements by which we can secure information from every portion of the Pacific slope. In all cases we will file our authority for any statements made in this column. No doubt mistakes will sometimes occur, but these we intend to be a rare exception to our rule of reliable news.

For eight years there has appeared in this journal, building news from every portion of the country. But in its condensed form it did not attract the attention it deserved. We begin the New Year by making a specialty of the item mentioned.

We desire the co-operation of country editors and mechanics to this department of this journal. By spreading the news of building engagement in your part of the country, you enhance the value of your section by proclaiming it a go-ahead community.

Architects should also notify us of "plans to figure on;" we do not charge anything for the insertion of such notices. Remember this journal is in the EIGHTH YEAR of its existence, and is the only journal published this side of the Rocky Mountains in the interests of Architects, Contractors, and Material Men.

Alameda.

A new building will be erected on Park Street by Mr. Boehmer.

Artistic Homes, for $3.50.
Modern House Painting, for $5.00.

W. Augistine is erecting a cottage on corner of Pacific Avenue and Chapin Street.

American House Carpenter, for $5.00.
Cutting Tools, for $2.00.

A fine business block will shortly be erected on Park Street near the S. P. R. R.

Grimshaw on Saws, for $4.00.
Mechanics' Geometry, for $4.00.

Mrs. Gill is having built a $2,500 house on Buena Vista Avenue.

Artisan, for $5.00.
Builders' Guide, for $2.00.

Robert Harvey is about commencing to erect a $3,500 building on San Jose Avenue.

Album of Mantels, for $8.00.
History of Architecture, for $15.00.

Alvarado.

Large additions to the sugar factory are proposed.

Building Superintendence, for $3.00.
American Cottage Homes, for $3.00.

Anaheim.

Albrecht & Co. are erecting a brick building for Mr. Langenberger.

Science of Carpentry, for $4.00.
Universal Assistant, for $2.50.

Aptos.

The saw-mill at this place was lately destroyed by fire. Mr. Hihn, with his accustomed energy, has started to rebuild.

Plaster, How to Make It, for $1.00.
Shavings and Sawdust, for $1.50.

Crescent City.

Plans have been adopted for a $5,000 school-house.

Lumberman's Hand-Book, for $2.00.
Practical Geometry, for $1.00.

Colton.

Plans are being prepared for a new opera house, by Mr. Grey, formerly of San Francisco.

Practical Perspective, for $5.00.
Woodward's Country Homes, for $1.50.

Clayton.

Geo. D. Nagle is erecting large additions to the winery of the Mt. Diablo Vineyard Improvement Co.

Woodward's Farm Homes, for $1.00.
Woodward's Graperies, for $1.00.

Davisville.

Leggett & Drummond are considering plans for an iron warehouse for storage purposes.

Manual for Furniture Men, for $1.00.
Common-Sense Church Architecture, for $1.00.

A Grangers' store and bank building is also on the tapis.

Painter, Gilder, and Varnisher, for $1.50.
Architects' Companion, for $2.50.

Duncan's Mills.

Lumber mills around this neighborhood are shut down for the season.

Hand Railing and Stair Casing, for $1.50.
Drawing for Carpenters, for $1.75.

Fresno.

M. H. White is erecting a handsome building.

Grimshaw on Saws, for $4.00.
Mechanics' Geometry, for $4.00.

It is rumored that T. E. Hughes, *et al.*, are taking active measures in regard to the erection of a $75,000 hotel building.

Artisan, for $5.00.
Builders' Guide, for $2.00.

Highland Springs.

On the tapis, the erection of a $5,000 hotel.

Drawing for Bricklayers, for $1.50.
" " Cabinet Makers, for $1.50.

Los Angeles.

A large bank building is being erected, at a cost of $70,000. S. and J. C. Newsom are the architects.

Drawing for Stone Masons, for $1.50.
Building Construction, for $1.25.

On January 7 a contract was let for a four-story building. Owner, Wm. Vickery; architect, R. B. Young. Cost, about $35,000.

Album of Mantels, for $8.00.
History of Architecture, for $15.00.

Los Gatos.

Architect Clinch, of San Francisco, has just let a contract to Butler & McGowan for a three-story brick building for the Jesuit Fathers. Cost will be about $35,000.

Cutting Tools, for $1.50.
Cummings' Details, for $5.00.

Madera.

C. S. Peck has signed a contract to erect a brick building, to cost $6,000, for Mr. Schmidt.

Artistic Homes, for $3.50.
Modern House Painting, for $5.00.

Monrovia.

Twenty houses are in course of construction in this town. A street railway will shortly be commenced. Monrovia is in the neighborhood of Los Angeles.

American House Carpenter, for $5.00.
Cutting Tools, for $2.00.

New Lighthouse

Will be built in Suisun Bay, near junction of Sacramento and San Joaquin Rivers.

WE WANT A BUILDING CORRESPONDENT IN EVERY TOWN IN THE STATE.

San Bernardino.

Plans are being prepared for a hotel in East San Bernardino Valley.

Steel Square Problems, for $1.00.
Work-Shop Companion, for 35c.

The contract for building a large hotel in San Bernardino has been let to Gray & Keefer, for $61,500.

Bound Volume California Architect, for $2.00.
Barn Plans, for $1.50.

So great is the building activity in Ontario that the light of the moon has been utilized to further building interests.

Every Man His Own Mechanic, for $3.50.
Tredgold's Carpentry, for $7.50.

Santa Cruz.

A new hotel to cost about $10,000 will shortly be erected here. J. S. Green is to be the owner.

Builders' Companion, for $1.50.
Builders' Work, for $5.00.

San Jose.

James Phelan is contemplating the erection of a new building to be used as a theater.

Builders' Construction (three volumes, very fine), for $14.00.
People's Cyclopedia (three large volumes), for $20.00.

Spencer & Rich are erecting, on the corner of Marker and San Augustine Streets, a two-story and basement brick building. Architects are J. Lenzen & Son, H. C. Skow being the contractor. Cost, about $6,000.

Plaster, How to Make It, for $1.00.
Shavings and Sawdust, for $1.50.

The same architects and contractor are erecting, for Luis A. Arguello, a two-story brick building on First Street. Cost, $11,500.

Lumberman's Hand-Book, for $2.00.
Practical Geometry, for $1.00.

A one-story cottage is being built on Tenth Street. Owner, W. Taylor; architects, J. Lenzen & Son; contractor, W. Taylor. Cost, $1,500.

Practical Perspective, for $5.00.
Woodward's Country Homes, for $1.50.

Santa Rosa.

Contract for the new County Hospital has been let to Carle & Croly, of Sacramento. It will cost about $10,000.

Mural Painting (new), for $3.00.
Home Hand-Book, for $10.00.

San Rafael.

J. Rosenthal is having a two-story frame dwelling erected, at a cost of $10,000. S. and J. C. Newsom are the architects, and Quink & Bignama, contractors.

Ruskin's Works (four volumes), for $6.00.
Industrial Drawing for Carpenters, for $2.00.

San Diego.

A large brick building for manufacturing purposes is being erected by Frank Kimball.

Limes, Cements, and Mortars, for $4.00.
Wonders of Art, for $1.25.

Seattle.

T. W. Bennett will shortly erect a large building for storage purposes.

Building Superintendence, for $3.00.
American Cottage Homes, for $3.00.

J. M. Colman will also erect a similar building to the above.

Science of Carpentry, for $4.00.
Universal Assistant, for $2.50.

Visalia.

A new hotel will in a short time be built at this place.

Architecture and Building, for $3.50.
American Cottage Building, for $3.50.

SAN FRANCISCO.

$37,000.

STEEL SQUARE, ITS USES, PRICE $1.00.

IN selecting house decorations see that the effect is not destroyed by the surroundings; for instance, when the carpet is faded and the furniture shows many years of faithful service, by no means indulge in bright colors, plush and satin chair scarfs, elaborately embroidered table coverings. Where it is necessary to conceal defects, subdued colors have a more pleasing result.

GRIMSHAW ON SAWS, PRICE - - - $4.00.

EDITOR BUILDING: I should like to have your opinion as to the respective merits of thick and thin mortar joints in brick-work. C. H. B.

The object of mortar in brick walls is to form an adhesive substance between the bricks, and it has little, if any, function beyond. The average bricks of which walls are composed are certainly harder than the hardest mortar, so that the object would seem to be to keep the joints as thin as possible for this reason alone. The wider the bed joints the greater will be the settlement of the building. For these reasons the mortar joints should all be kept as thin as is consistent with perfect adhesion between the bricks, and, without doubt, should be thinner than it is now usual to form them. The side joints will be regulated in size by the dimensions of the bricks. The quality of the mortar in a brick wall is of much more importance than would seem to be generally understood. This was well illustrated in an accident which happened recently in this city. A flour warehouse fell to the ground by reason of the bad mortar used in its construction. The flour barrels were loosely packed in such a manner as to throw considerable thrust upon the walls, and, the mortar being of very bad quality, the bricks were separated, with the result of bringing down the building.

Fire Hose and Garden Hose, W. T. Y. Schenck, 256 Market Street.

ONE thousand brick, closely stacked, occupy about fifty-six cubic feet.

SAN FRANCISCO, CAL., FEBRUARY 15, 1887.

Our patrons are informed that Clarence L. Crabbe has no connection whatever with this Journal. He is not authorized to make any collections, or receive either subscriptions or advertisements.

Bound Volumes of the year 1886 are now ready. We will forward a copy to any address upon receipt of $2.50.

Mechanic's Lien Law, Twenty-five per cent, Thirty-five Days, Filing Contracts, etc.

THE law as it now is, among its many other maladroit provisions, makes it obligatory upon owners to retain in their hands twenty-five per cent of contract sum, for a period of thirty-five days from and after date of completion of buildings, or works of any kind, with the alternative that if said twenty-five per cent is not so retained, the owner remains liable to creditors of the contractor, who may have performed labor, or furnished materials, for the period of time named, although the owner may, in good faith and with honest intent and purpose, have paid the full sum of agreement to the contractor, at completion, or prior to the expiration of the thirty-five days. Consequently, if an owner presumes to act kindly, and pay promptly upon completion for the materials and labor performed for, furnished to, and enjoyed by him, he must assume all the risks and chances that may follow the payment of more than seventy-five per cent of the amount of contract price, prior to the expiration of the time provided in the statute—nearly one-tenth of a whole year.

The thirty-five-day clause serves no good purpose, nor is it just when made compulsory by legal enactment. Parties to any transaction may agree upon credit payments, but when a form of law is passed by the law-making powers, which proposes to *compel* men to give and accept credit, whether they desire to do so or not, is an invasion of personal and business rights—"special legislation" in that its operation selects a *special class of operators*, and subjects these to its *special penalties*. In addition to this, it imposes positive hardships and inconveniences, more or less upon all concerned, but especially upon those least able to bear them—sub-contractors—who, as a rule, need all they earn as soon as it is earned, and being kept out of any portion of their earnings for thirty-five, or any other number of days, is a deprivation both unjust and unfair. For while some of our building contractors have the means to liquidate all claims against them, promptly, the larger number are possessed of no bank accounts, and can only pay as they receive the contract payments; and as a further rule, stair-builders, plasters, plumbers, painters, and other sub-contractors, are made to share a part of this thirty-five days' requirement, and it is no wonder that "the Lien Law," is a common expression among those who are compelled to bear the burdens it imposes.

Hundreds of thousands of dollars are continually tied up by this process of law, which should be in circulation. But few owners are benefited by this delay in payments, as but infinitesimally few, if any, commence building improvements with any consideration, if even a knowledge of the fact that the law gives thirty-five days' credit on one-fourth of all contract sums they may enter into, exceeding $1,000. Nor is it likely that one in one thousand would commence building simply, or to any extent, by reason of this provision of law. Owners, as as a rule, see to it that their resources are, or will be equal in proper time to any undertaking ventured upon; and again, as a rule, payment at completion is convenient, and is preferred to having an unsettled balance hanging for thirty-five days. The few who would desire such accommodations, can always make the arrangements, without any necessity of forcing anyone to accept an undesired thing.

It gives no additional security. It is a bad law, in that it does not increase security to any creditor of a contractor, except that it operates as a period or specie of notification, in which creditors may be able to find out that certain contract money, as a whole, has been earned. If upon this is based the merits of the provision in question, it is a heavy imposition upon very many innocent parties, and is a legal circumlocution which could be greatly simplified by aiming directly at the evil sought to be remedied—that of dishonest men receiving the moneys of contracts, and failing to pay their debts. If creditors must be notified, if they are unable to keep the run of things, and cannot rely upon the integrity of their customers, the law otherwise provides—sensibly—a means of protection, *i. e., notify the owner*, which done, the owner must reserve the amount of claim from the contract amount, or be responsible to the creditor in the amount due him. Thus every creditor, by taking timely precaution, can make himself safe, without the unfair, unjust, and iniquitous imposition of a penalty of thirty-five days' waiting for the payment of moneys due. "Delicacy" toward the man mistrusted is the common excuse for not pursuing the notification course. "Don't like to," for fear of offending—who? The man whose honesty or ability to pay is questioned. But this course would require personal action and individual responsibility; hence the promoters and advocates of the thirty-five days' rule shirk this plain, reasonable, and effective method, and skulk behind the bulwarks of ungenerous legal construction, to avoid a course that might, perchance, displease a customer who had been suspicioned as more dishonest than he proved to be, even if this shirking disposition has the effect of paralyzing the circulation of a few hundred thousand, or, perhaps, a million dollars.

Banks and loaners gain, borrowers lose. Loans, particularly

EACH SUCCESSIVE ISSUE OF THIS JOURNAL WILL SHOW A MARKED IMPROVEMENT.

when money is tight and interests comparatively high, are charged to the borrower from the time the loan is granted, upon the theory that the amount of the loan is "set apart to the borrower," at the time the loan is passed upon. This, however, is not practically true in all cases, but when applied, operates as a grinding process upon the borrower, who receives no abatement of interest during the thirty five days, while the bank or loaner is at liberty to speculate with the moneys "placed to the credit of the borrower," for the full period of the law's delay, and thereby receives double interest on the amount.

Designed to head off rogues. Yes; at whose expense? Everybody concerned specially, and the entire building trade in general. The framers of the preposterous proposition failed to take in the whole situation, or to exercise intelligent comprehension as to effects, in that in the attempt to catch the disbonest, good men's rights are throttled. Legislation which proposes to withhold moneys due, rightfully belonging to other parties, is ill conceived and unjust. As a matter of course the law is general in application, and good men may be punished by its provisions, in that they may be deprived of moneys due them by right, if not by law. Of course, owners under contract with good, responsible men, may pay the contract moneys at pleasure, and assume the risks in doing so, but some are apt to utilize the legal privilege of holding onto their coin as long as the law allows, and this is more likely to be the case in large jobs, involving large sums, more than in those of moderate cost. Take, for instance, the Flood building, on Market Street, the contract of which for carpenters' work alone, amounts to over $100,000, and with the other contracts, a total of over $300,000, which leaves in the hands of the millionaire owner, under the thirty-five days' clause, of the contract amount earned at completion of the building, seventy-five or more thousand dollars of moneys *rightfully* due others, who may stand, hat in hand, and beg, while the owner may laugh and reply: Wait the law's appointed time, and I will pay you what you have already earned.

The intent of those who manipulated the framing of the present law, was, in the main, good, in that it proposed to provide better security for the payment of material men, sub-contractors, and workmen, with that other nicely worked in, objectionable joker, which makes those furnishing materials the *second* in class of preferred creditors, labor being *first*, leaving "sub-contractors" *third*, with no chance to get any pay, provided the balance due on contract amount at final settlement should be no more than sufficient to pay, *first*, workmen; *second*, material men. To claim fairness or equity in such an arrangment of law, is simply a ridiculous absurdity. In cases where there are shortages in the contract sum, imposing the only alternative—*pro ratio* settlement, every individual creditor is, by every consideration of right, entitled to a fair and just proportion of the money to be divided. But the last amendments to the law, those now in operation, were brought about through the efforts, and at the expense of those who were personally interested in classifying the "rank of each lien," as follows: *First, all persons performing manual labor; second, "persons furnishing materials;" third, "sub-contractors;"* poor fellows, how gratifying to them to stand by and see the wealthier class, the class abler to lose, step in and take all that is due them, if there is enough for that purpose, and if not enough, then to take all there is, and those who have furnished both material and labor, as "sub-contractors," be smiled at as unfortunates, because in the *third* class, yet as justly a creditor, and entitled to pay as much as those who receive all, or the larger portion of their claim.

The filing of contracts in the manner provided by the law, *to wit*, "prior to the commencement of the works," is mischievous, oppressive, and unjust, in that it jeopardizes and endangers the rights of owners and contractors, if not so filed in point of time, the Superior Courts holding that the plans and specifications are parts of the contract, and must also be filed, and sometimes to do this, the commencement must be delayed, which should not be rendered necessary by unwise, and impractical legislation. Yet if the filing is not done in time, the contract obligation is rendered void, and the owner must suffer, while all the purposes of filing might be as well accomplished, if filed within five (or ten) days after "commencement" was inserted for the arbitrary "before." The less than one dozen of those interested in the entire building business in San Francisco, who hold to the "before," use a very unfair argument in defense, by claiming that there are contractors who, in less than ten days after commencement of the work, can and do practice deceits and rascalities which would not be possible by an earlier filing. To admit this as true, it does not reflect much credit upon the intelligence or acumen of those who allow themselves to be caught by such (very few) disreputable fellows, for none but men without business standing or reputation would do any such rascally things; and if such persons can ply their games, and beat men of long business experience as material men, mill men, etc., those beaten ought to acknowledge themselves beaten, and keep quiet through shame at the r own want of fair business smartness, rather than seek to impose onerous exactions upon ninety-seven-hundredths of those who are square and upright in all their transactions. There is a moral debasement running all through the law, as it is, which aims at protection to material men, etc., without any consideration of the rights and conveniences of honest mechanics, architects, or owners, for which reasons the law should be, and likely will be amended during the present session of the Legislature.

Contract Equities.

THE greater number, in fact nearly all building contracts, are made up from the owner's standpoint, and either the architect or attorney who formulates the obligation, is very careful to include and guard his client's every interest, with no special provisions protective of the party of the second part—the contractor. Building contracts, in a general sense, propose two things: First, that the contractor shall furnish and provide the material and labor required to carry out and fulfill the requirements of the plans and specifications, and, second, that the owner is to pay the agreed sum of contract for the proper execution of the work contemplated by, and defined in, the agreement.

If there were no contingencies involved or possible, a contract containing no more than is written above, would serve all practical purposes. But as it is, there are numerous possibilities that may arise during progress, in reference to quality of materials sought to be used, character of workmanship, delay in progress of the work, liabilities for debts created by the contractor, injury to person or property, and a variety of mishaps that the owner must be protected against. This is usually carefully attended to in preparing the contract, with scarce a word not intended to obligate the contractor. He must do this, and that, and the other thing, just in the way and manner prescribed by the plans and specifications, subject to penalties and charges for all neglects and failures that may occur; but it is seldom that contracts provide against hardships that may be imposed upon the contractor. Yet alike, the man who builds a building, using his skill and mechanical abilities and his means and credit to fulfill his agreement, and he who pays coin for such fulfillment, have rights and equities, which should be respected and properly treated in the one as much as the other.

The figuring and valuations leading to contracts, are usually based upon the plans and specifications, and if the plans do not show and fairly represent what may afterwards be *claimed* as the "true intent and meaning" thereof, the architect producing the plans being the "*conclusive*" authority upon the point of intent and meaning, the man most affected by the interpretation, is obliged to accept the rendering of the architect, and proceed accordingly, although doing so may add materially to the costs of the work, more than would be required if the plans were interpreted by disinterested parties. Plans *intended* to show, and *properly showing* true intent and meaning, may be widely differing propositions.

The specifications are another most important factor, and if so sufficiently clear and intelligently drawn as to cover all requirements, there can be no issues in regard to them; but if vague, and possible of more than one construction, they thereby become misleading; and if "conclusively" read and interpreted by the man who in haste put them together with omissions, or through incompetency failed to incorporate all that was wished for by the owner, the effect upon the contractor is the same, if bound to submit to an arbitrary rendering.

Again, under rulings of the courts in this State, if an owner neglects or refuses to make the progress payments, the contractor is not thereby relieved from progressing with the work, nor can he claim such non-payments as "prevention of contract" by the owner; but he must go on and complete before he can lien the property or commence legal proceedings to recover the contract moneys. Or an owner may not be prepared at the time called upon to make a payment, or he may hold the moneys due the contractor for speculative purposes; meanwhile the contractor must go on, nurse his credit, provide the necessary cash to pay workmen, and suffer many hardships, because the owner pleases, or is forced to delay payment.

Certainly these, and numerous other considerations, which space will not permit us to recite in this issue, should influence both architects and owner to a reasonable and just appreciation of the equities which should be incorporated in building contracts.

NOW IS THE TIME TO SUBSCRIBE FOR 1887, $2.00 PER ANNUM, IN ADVANCE.

San Francisco Chapter American Institute of Architects.

THE regular monthly meeting was held on the evening of the 4th inst., A. Pissis, president, presiding; B. E. Henricksen, Secretary. The committee appointed to interview the freeholders in reference to the Board of Public Works, reported that nothing had been accomplished in regard to the subject matter of its appointment.

James E. Wolfe, of committee to confer with a like committee from the Builders' Association, in reference to a uniform builders' contract, reported that the conference of committees had prepared and submitted a form of agreement, which was thought to adjust the rights and equities of both contracting parties, in lieu of the usual rather one-sided obligation generally used, in which the binding claims are more oppressive than generous to and upon the contractor. The new form presented for the consideration of the Chapter, suggested clauses of contract which, while compromising none of the owners' fair and reasonable rights, extended such reliefs and qualifications to the parties of the second part, as were consistent with fair dealings between man and man. A motion to accept and file was debated, the Chairman of the committee urging that the Chapter should express its approval or rejection, or suggest such amendments to the proposed form as would make it acceptable; but the sentiment prevailed that each architect should enjoy the right to draw up contracts to suit his own and his client's notions, and if the building clauses should be distasteful to the party of the second part, he could exercise the right to decline signature, leaving the architect the alternative of letting the work to some other party less scrupulous in regard to obligations which might, under certain conditions and circumstances, be made severely oppressive. The motion to receive and file, prevailed. Hence the time and labors of the joint committee resulted in waste, as far as concert of action by the Chapter was concerned.

A report was also received, through the same source, in reference to the amendments to the mechanic's lien law, stating that material changes and amendments have been formulated and forwarded to Sacramento for legislative action, with the hope that our law-makers, now assembled at the State Capitol for the ostensible purpose of legislating for the common weal, will oblige nine-tenths of their constituents engaged in the building business, by expunging many of the hardships and weaknesses of the law as it now exists, and substituting fairer and more equable and practical features, much better calculated to insure the purposes of the statute, without imposing any of the many—at present impractical and bad—conditions of the present law. Two of the most important changes modifies the present requirement that twenty-five per cent of the contract sum shall remain unpaid until thirty-five days from and after completion, to a delay of ten days; also, that instead of the contract being filed *before* the work is commenced, the time for filing to be extended to *within ten days after* commencement.

A paper was read by Mr. Gash, on the subject of ancient and modern plumbing, which, by order of the Chapter, is published in full in present issue of this journal.

Contractors Should Secure Fair Prices.

IN a short time building activities for the year 1887 will be fairly begun. Let each contractor resolve that he will maintain prices throughout the year. There is nothing so detrimental to the building trades as dishonorable competition. If you cannot figure to do good work, furnish good material, and pay reasonable wages, leave the job alone. If builders could combine and hold to fair prices, there would be a great deal of money made this year. Do not charge exorbitant prices for your work or owners will invest their capital in other ways. But figure so as to make a fair margin and enough to allow for extras. The common complaint among builders has been that such close figuring was done that legitimate contractors could not get enough work to keep their men going. Somebody gets beat. Is it the owner, the dealers in building material, or the contractor? We think in many cases it is the three. Why disgrace the profession in this way? Just as much work will be done if contracts are figured so as to leave a fair margin as there will be if the figures are so low that everybody will be beat. Turn over a new leaf this year and make some money.

JUDGE MILLER recently decided a case in the New York Court of Appeals, in which he held that if the owner of a building employs a mechanic to make repairs upon the same with no specific arrangement as to terms and conditions, such employment is in the nature of an independent contract, which imposes upon the employe the responsibility incurred by the negligence of himself or those who are aiding him.

Building Summary for February.

THE past month has been dull, as far as letting new contracts is concerned. Allowance must be made for the bad weather of the past few weeks. During the month just passed, the following summary will show the number of building engagements, and the value thereof:—

30 frame buildings, value	$126,000
5 brick " "	53,250
13 alterations and additions, value	25,200
48	$204,450

Why Are Bath and Water-Closet Combined?

MODERN houses located in cities, all contain a convenience the names of which are too numerous for mention. Perhaps the French No. 100 is as good as any. "Retiring Room," is a euphemism which will meet the same fate as the once delicate word "privy," which signified a private retiring room. Whatever its name, we all want it, but we want it perfect of its kind, able by its mechanical construction to remove from us without injury to our senses or our health those matters for which the body has no more need.

Most modern houses also contain another convenience, to some extent a necessity, but in great part a luxury. This consists of a tub, usually resembling a coffin in shape, and capable of containing enough hot or cold water to cover the body. At its simplest, a bath is a matter of cleanliness; but in its most developed condition it may be considered one of pleasurable sensations, and it is to be noted that unless the latter are received by the bather, he is much inclined to omit the bath.

No matter how carefully the privy, water-closet, retiring-room, or whatever else it is called, be constructed, the sense of smell will always find some offense there, and that of sight may at times have its delicacy offended. Since this is the case, the question may be asked, "Why is it usual to locate the water-closet in the bath-room? Why is the bather condemned to have his sense of smell offended by emanations which proceed from matters excreted either by his own body or those of other members of the family? What natural connection is there between a water-closet and a bath.

If the matter were simply one of smell, or even one of smell and sight combined, it might concern delicacy, but would have no grave import. But in fact it is a matter of health also. Even though the closet be as perfect as plumber and sanitary engineer can make it, it ought not to be combined with the bath-room because of the possibility of derangement, the probability of its use by members of the family suffering from sickness or disease, and the fact that it requires conditions different from those of the bath-room in order to maintain it perfect. For half the year, at least, through our long winters, the bath-room, if it is to be at once a source of health and of pleasure, requires to be heated, while the closet is decidedly better without any artificial heat. The former is, or ought to be, a place in which we spend some little time, while the latter is, or ought to be, for actual necessity only.

It is comfortable, no doubt, at times, to have the closet handy, and handy it can be, but should be accessible from the bath-room only by passing through a door. It should be so placed that access to it can be obtained without entering the bath-room, so that it can be used by one member of a family while another is bathing. Who among us does not know the misery of waiting until another has bathed, or the equal misery of bathing while the too handy necessity beside the bath is in use?

A great deal of modern delicacy is opposed both to convenience and health; but here is a matter in which convenience and health are consonant with delicacy, since the last is in the highest degree outraged by the usual arrangement; yet delicacy has not yet taken umbrage at the unholy union of privy with bath, nor have convenience or health brought in their batteries against it.—*W. N. Lockington, in Builder and Decorator.*

Something to Be Remembered.

SWING all doors to the right as you enter an apartment; they are thus handled conveniently.

It is better to oil floors than to paint them; a monthly rubbing will make them as good as new.

Soiled wall paper may be cleaned with dry bread carefully applied.

Leaks in sewer or plumbing pipes may be detected by injecting oil of peppermint into any portion of the apparatus.

If varnish or oil does not flow easily, add powdered camphor.

Shellac and borax boiled in water produces a good stain for floors.

BUILDING CORRESPONDENCE DESIRED FROM EVERY PORTION OF THE PACIFIC SLOPE.

Evolution in Architecture.

BY H. M. HUGUNIN.

THE gradations that have occurred in architecture from the earliest period to the present day are as marked as those that distinguish every other branch of art. The earliest dwellings of which we have any record were caves, or grottoes, which date to a time before ancient Troy was built. Some of these

ANTIQUE CAVERN-DWELLINGS

Are said to have recently existed in the Island of Sicily; and on the coast of Syria, not many years ago, was an extensive subterranean city, constructed like a beehive. Mud buildings were imitations of martin's nests, and Plutarch mentions cottages made of framework and mud. In the days of Abraham the nomadic tribes

DWELT IN TENTS,

Which they removed from place to place as the exigencies of their herds required, and in Arabia the wandering tribes still live in their primitive houses. These, with the caverns, the mud kraals of the Hottentots, and the wigwams of the American Indians, were the first habitations of man. In form the kraal and the home of the Esquimaux resemble each other. The one, however, is built of mud, and the other of ice.

Towns were originally built for protection, and erected like fortresses, and to them the herdsmen and tillers of the ground retired when endangered by their enemies.

Of the cities now existing, Damascus, in Syria, is the oldest, and to this day retains many of its early characteristics. The

WIGWAM OF THE AMERICAN INDIAN,

In all tribes, from the arrival of Columbus, in 1492, to the present era, displays its original features, although native skill has sometimes produced a few changes in the material. Poles united at the top, and so spread at the bottom as to encompass a few square feet of ground, form the accustomed frame. Upon this are fastened strips of bark or the skins of animals. The ground is the floor, on which a fire is built in the center, the chimney consisting merely of an opening left in the covering at the summit of the structure. Here the family reside until a scarcity of food or other social need compels them to remove to another locality.

ARCHITECTURE AMONG THE NORTH AMERICAN INDIANS.

A primitive home, easily taken to pieces, and carried about the country.

THE HOME IN THE FOREST.

When white men began to emigrate from the Old to the New World, the conveniences to which they had been accustomed, and the inconveniences of the Indian wigwam, led them to erect dwellings more suitable to their tastes and habits. Unlike the Indians, they were producers of various crops, and required more land or a homestead. Shelter was a prerequisite while they were clearing away the forest and preparing the soil for cultivation. Building materials and tools were scarce and of the rudest sort; and the home was made of branches of trees for framework, covered and floored with slabs or boards roughly hewn from fallen trees, with fireplaces and chimneys wrought with stones and clay. In other cases the trunks of trees were piled one upon another, leaving great intervals of space between, to be filled with strips of wood and mud. Roofs were constructed of rough slabs, boards, or bark. Windows were few and consisted, in the warmest season, principally of open spaces in the walls. In such dwellings were born and reared some of the noblest men and women whose names and deeds emblazon the records of this nation. The ancient cottages of Great Britain, were a trifle in advance of the first home in the wilderness, but still devoid of elegance in either construction or material. Low walls of stone, the doorways reaching nearly to the eaves, the diminutive, latticed window, and the roof thatched with straw, composed a dwelling both picturesque and comfortable for the rustic family. In such a residence was born the favorite Scottish poet, Robert Burns, near Ayr, in 1759.

THE LOG HOUSE.

The style of building common among the early settlers in the United States.

The house where George Stephenson, "the father of English railways," was born, at Wylam, England, shows a better class of rural cottages, but is lacking in every element of beauty, indicating the rude, practical rearing of the common laboring class. But the genius of Burns and of Stephenson have cast about these cottages haloes of glory that make them very attractive.

EARLY HOMES IN AMERICA.

In America, also, the early homes of many of our millionaires, statesmen, and warriors were no better than those in which the great and noble of Europe were first cradled. General Grant's birthplace on the banks of the Ohio; the log cabin of Abraham Lincoln, in the wilds of Macon County, Ill., in 1830; and the first home of Jay Gould, in Connecticut, are fair examples of the dwellings in which many of our most noted men have been reared.

But as the country gradually developed, and its varied resources were brought into requisition, one by one, the agriculturists became competent to erect better dwellings, and with the increase of commerce, merchants acquired more room and means for the exercise of their social tastes, and soon

RURAL AND METROPOLITAN MANSIONS

Began to beautify the natural surroundings of town and country. The plain stone or brick mansion, with its square windows and corners, its porticoes with massive columns, its general air of solidity and comfort, with here and there an ornamental gable, a bay-window, and graveled walks in the gardens, filled with beautiful flowers, succeeded to the uncouth wooden tenement of former years of frugality and privation.

VARIATIONS OF ARCHITECTURE.

Architecture, like the fashions in dress, has varied with each succeeding age, governed by the necessities of the people quite as much as by their tastes. In the old medieval days of knightly lords and fighting henchmen, arose the turreted strongholds, the impregnable castle, the moat, the drawbridge, and the guarded approach; and the edifices of that age, ruined and picturesque, now adorn many a landscape in the European States. Then rose the abbey and

THE BUTTRESSED CATHEDRAL,

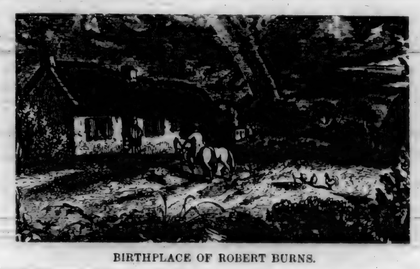
With their quaint forms, their solid masonry, their gorgeous windows, their imposing towers, and their fretted interiors, dignified, solemn, and inspiring throughout.

Later ages brought more cheerful ideas of social and religious life. The knights, henchmen, and monks passed away. The new generation was more peaceful. Taste succeeded strife and spoil. Learning and the arts of peace became popular, and genius evolved new and more pleasing forms of architecture. Mansions grew less like castles and dungeons, cathedrals became churches, with more of light and love in their worship, and dignity and arrogance gave

place to gentler emotions. Sociability led to frequent exchanges of opinions; men cultivated those things in architecture and art that tended to elevate the mind, educate the taste, and develop comfort, convenience and elegance in the home.

THE PROGRESS OF IMPROVEMENT.

As the arts and sciences expanded, they were pressed into service for the improvement and adornment of the residence. Old-fashioned systems were discarded, and new materials and new arts were brought into requisition for the expression of the spirit of the age. The grate superseded the fireplace; the stove succeeded the grate; the furnace took the place of the stove; the steam-heater crowded out the furnace. The whale-oil lamp pushed the candle out of the family room; kerosene oil superseded whale-oil; coal-gas threw both oils out of the household economy, and electric lights drove gas-light into the background. So in architecture. Antediluvian granite and costly marble succeeded the limestone and brick in masonry, as common stone and brick had superseded wooden building material.



BIRTHPLACE OF ROBERT BURNS.

The old style cottage of the English peasantry, common in England in the past century.

SECURITY AND GRANDEUR

Were born of iron and terra-cotta; and with each recurring change in building and building material came increased elegance, convenience and luxury.

It is true that in this growth of architectural display the styles and rules of the old arts in building have been largely ignored and sacrificed, and new forms and features, unknown in other times, have been pressed into the service of

THE MODERN ARCHITECT AND BUILDER,

But in all this is manifested the changing spirit of the ages. Just as the arbitrary sentiments of the medieval times have passed away, and as the more liberal spirit of the nineteenth century now prevails, so the architecture of the past has succumbed to the more independent, versatile and attractive shapes assumed in the buildings of to-day. This is the epoch of

ORIGINAL AND ELABORATE ORNAMENTATION,

And the expansion of these grand architectural achievements is limited only by the capital of the individual who desires to build.

HOUSE IN WHICH JAY GOULD WAS BORN.

The form of dwelling which succeeded the log house in New England and the Middle States.

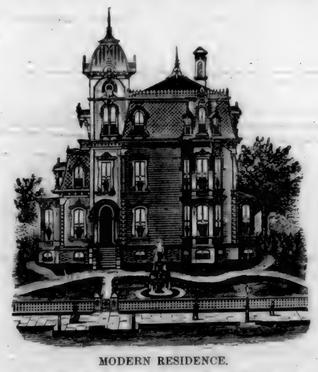
If we compare, for example, the beautiful villa of Alexander Pope, at Twickenham, England (exhibited in the poem on another page), with the magnificent family mansion of James C. Flood, at Menlo Park, in California, twenty miles from San Francisco, we shall be struck with the contrast they present.

PUBLIC EDIFICES.

We call attention to one more striking contrast in the architecture of the past and present. A representative of a past age is Independence Hall, Philadelphia, where the Centennial Congress held its sessions, and where the Declaration of Independence was adopted July 4, 1776. Venerable in its architecture and associations, it did honor to the social and political era in which it became famous, but, in contrast with the present Capitol of the United States, it shows the difference that a century has wrought in American architecture.

THE PRESENT CAPITOL AT WASHINGTON,

Critically considered, externally and internally, may not strictly be termed a grand architectural triumph, but in its vast proportions, imposing elevations and valuable art-works, it sheds luster upon the nation which it represents.



MODERN RESIDENCE.

The style of dwelling with mansard roof which was largely in fashion in the United States from 1860 to 1870.

In America, for several generations, architecture scarcely kept pace with the improvements in other branches of art throughout the country, and has been more especially developed within the past decade, so far as residences are concerned, than at any former period. For nearly a century there were but few radical changes, and these were improvements rather in securing convenience and comfort than elegance.

WIGWAM AND SHANTY.

It is true that the wigwam and the board shanty had their places, just as they have now, among the Indians and lumbermen of the wilderness, and in these, there was, of course, little or no improvement. Shelter was the only object sought, and everything among these primitive classes was sacrificed to secure comfort, even in its rudest form.

FIRST FARM HOUSES.

The pioneer settler on new lands felt the necessity of ample shelter for himself and his family, but beyond this his ambition did not extend until he had gained cultivated soil sufficient to yield him all the necessaries of life. Then the log house and the board shanty were supplanted by the neat, plain frame house, without paint, or cornice, or blind, or a single ornament in its construction. In time a cornice, shutters, and a coat of paint were added. As prosperity increased, a back kitchen was attached. Later on, a wing was projected on one side, with a small portico in front. Next year the growing family required another wing on the other side, with another portico.

THE HOUSE OF SIX GABLES.

Wealth continuing to accrue, a new site and a new house of larger size and more imposing appearance was planned and built. It had a stone cellar, or basement, was two stories high, built of wood, with high ceilings, and had long windows, green venetian blinds, a six gabled roof, dormer windows, and several entrances, reached by steps.

THE RURAL MANSION.

A few years later, a new location suggested the large square tenement, two stories high, with a substantial cellar, a center hall running through the building, large rooms, immense windows, a square hip roof with heavy cornice, and chimneys on every side, a covered piazza extending around three sides of the lower story, and venetian shutters to every window.

THE MANSARD VILLA.

A town residence becoming desirable, brick, stone, and mortar grew into a mansion of two stories and a basement, with bay-windows, or a swell front, a mansard roof, stone steps, and iron balusters, a fanciful porch at the front door, and a general air of gentility pervading the whole. Lawns, walks, and flower-vases distinguished the front yard.

THE HOME OF A BUSINESS MAN.

Cultivated taste soon induced the wealthy citizen to invest in a more attractive residence. Fifty or a hundred thousand dollars were expended in a family mansion of more elaborate grandeur, the finest material, the most delicate ornamentation, and a degree of architectural beauty seldom realized, and of which the house-owner had seldom dreamed. To build it, marble, granite, freestone, iron, pressed brick, terra-cotta, and hard woods in great variety were brought into requisition; curves and oblique lines were diversified in its elevation, and a towering cupola embellished with the numerous artistic designs of modern architecture, topped the stately edifice.

THE PALACE OF THE CAPITALIST.

But the millionaire was not content with this, the most notable architectural triumph of his times. Money bought a noble situation; purchased the taste and skill of the best architects for its design, and ship-loads of the most costly stones that modern quarries, east or west, can produce, the best skilled builders, the choicest of everything, native and foreign, that can be used in its construction were ordered, until the expense mounted into a million or more of dollars. Of such is the mansion of James C. Flood, the work of which occupied several years, and it is undoubtedly one of the finest dwellings ever designed and erected in America. In it are combined all the elements that make architecture beautiful.

Architecture possesses the versatility that characterizes the kaleidoscope; it can produce a thousand varied charms, which depend solely upon the good taste of the designer and the skill of the artisan to perpetuate forever.

RESIDENCE OF J. C. FLOOD.

The summer home of Mr. J. C. Flood, at Menlo Park, near San Francisco, California, is of unique modern architecture, constructed from new and original designs, regardless of cost.

EGYPTIAN ARCHITECTURE.

The records of ancient architecture are replete with wonders and curiosities, and as history is often said to repeat itself, it would not be strange if modern innovations in this art should develop styles of private and public edifices just as unique and worthy of attention. The ancients built, undoubtedly, with a view to the perpetuity of their houses, and, therefore, endowed them not only with permanency, but also with a degree of ornamentation that still excites the admiration of the beholder. Some of these peculiar structures form a pleasant study.

The earliest Egyptian column resembled a stalk of the lotus-plant, capped by its calyx, and this flower possessed a powerful influence in forming the public taste of the past ages, when Egypt was in the height of its prosperity. But its early style of architectural ornament was heavy, and suggested no repose. Everything was built on a grand scale, suited only to the vigorous careers of her despots and conquerors. Her buildings were characterized by forests of columns, avenues of sphinxes, lions or rams, of collossal size. They also made large moles, with giant statues in front of them, with obelisks, gateways preceded by avenues, and detached from the moles.

The general plan of the great Egyptian temples is thus described by Devon: 1. An avenue of sphinxes. 2. Two colossal figures on each side of a gateway formed by immense towers of truncated pyramids and overhanging cornices. 3. This gateway led into a court full of columns, and chandeliers around the walls. 4. Passing across this, there are other courts, likewise full of columns, through gateways ornamented with colossal figures and obelisks. 5. In the center was the sanctuary, without light, consisting of a single excavated block. One, at the Temple of Latona, was seventy-one feet broad in front, carved out of one entire stone, and roofed by another.

The palace of the kings of Babylon, now in ruins, is a vast mass, measuring 2,100 feet each way. The walls are eighty feet thick, one within another and strengthened with buttresses.

The most astonishing collection of finished and costly architecture in the world, now a mass of splendid ruins, is at Baalbec, in the valley between Libanus and Anti-Libanus. The platform, on which was raised a temple to Baal, or the sun, contains stones thirty feet above the level, more than 60 feet long, 24 feet thick, and 16 broad. Each of these stones measures 23,000 cubic feet, and weighs 2,500 tons, squared, sculptured, and brought from distant quarries. Six of the columns are each 72 feet high, formed of three stones each 7 feet in diameter, with finished Corinthian capitals and friezes. It is believed to have been the work of the giants who formerly, as all authorities agree, dwelt in the mountains of Lebanon. Three stones still remain in a wall at Baalbec, 63 feet, 64 feet and 67 feet long. It is stated that the place was in existence in the days of Solomon, when it was called Baalath, but it was not built by him.

The modern Arab tent is said to exactly resemble that of three thousand years ago, and is made of black and brown cloth, the product of camels' or goats' hair. Arabian architecture advances slowly.

Pliny says that the Cyclops of Greece were the inventors of the fortifications of towns and towers, and from them is derived the Cyclopean style of architecture, which is noted for its extraordinary magnitude. The Cyclops were distinguished for their power, prowess, and mighty structures, and are believed to have been the giants referred to by the prophet Isaiah. The peculiarity of their style was the piling up of immense blocks, without cement. Tyryns, now in ruins, is mentioned by Homer as a well-walled city, and was undoubtedly the work of Cyclops, as was, also, the ancient city of Mycenæ. The Gate of the Lions, at the ruins of the latter, was built by the Cyclops, and the lions, from which it derives its name, are said to be the only existing specimens of the sculpture of those ages. They have no tail, a circumstance observable also in the sculptures of Persepolis, where animals like those at Mycenæ are represented. The Cyclops appear to have been a nomadic class of artisans, for two fine specimens of their architecture are found at Ausidonia and Saturnia, towns of Italy, anterior to Rome. In view of these facts, Sir Richard Phillips says: "There can be little doubt that the fraternal association of Masons originated in the traveling jobs of the Cyclops and early builders."

A characteristic of the architecture of the ancients was massive solidity, necessary, probably, as a means of defense against enemies.

The Homes of England.

BY MRS. HEMANS.

THE stately Homes of England! How beautiful they stand,
Amidst their tall ancestral trees, o'er all the pleasant land:
The deer across their greensward bound
Through shade and sunny gleam,
And the swan glides past them with the sound of some rejoicing stream.

The merry Homes of England!
Around their hearths by night,
What gladsome looks of household love
Meet in the ruddy light.
There woman's voice flows forth in song,
Or childish tale is told,
Or lips move tunefully along
Some glorious page of old.

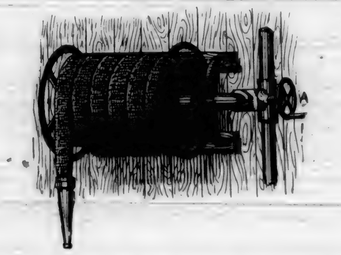
The blessed Homes of England! How softly on their bowers
Is laid the holy quietness that breathes from Sabbath hours!
Solemn, yet sweet, the church-bell's chime floats through their woods at morn;
All other sounds, in that still time,
Of breeze and leaf are born.

The cottage Homes of England!
By thousands on her plains,
They are smiling o'er the silvery brooks
And round the hamlet-fanes.
Through glowing orchards forth they peep,
Each from its nook of leaves,
And fearless there the lowly sleep,
As the bird beneath their eaves.

The free, fair Homes of England!
Long, long in hut and hall,
May hearts of native proof be reared
To guard each hallowed wall!
And green forever be the groves, and bright the flowery sod,
Where first the child's glad spirit loves its country and its God.

WE are indebted to Thos. E. Hill, Esq., editor of the *National Builder*, for the matter contained in the foregoing article, as well as the beautiful cuts illustrating the same. The *National Builder* is published in Chicago, at 103 State Street. Price, $3.00 per year.

Fire Protection.



PROBABLY one of the most useful inventions of late, is the "Paragon" Hose Reel, represented by the above cut. It is designed for use in warehouses, public buildings, manufactories, hotels, etc., and especially in buildings where there are times when only a watchman or a few persons are about. It is permanently fastened to the wall, out of the way, supported by suitable brackets, and connected directly with the supply pipe through a hollow journal and packed joint, which allows the water to pass freely into the hose, the hose being connected to the hollow journal inside the reel, and reeled up as shown in the cut. Upon the discovery of a fire, the party present quickly turns on the water by the valve "A," takes the hose pipe and runs off toward the fire, the hose running off of the reel freely, without a twist or a kink, and the water following immediately, thus saving the very valuable time usually lost in strightening out the kinks and twists in the hose, and in going back to turn the water on.

Every hotel, public building, and manufactory should have one or two of these reels, with hose to reach to every part, on each floor.

The packed joint is simple, allows the reel to turn freely, and automatically becomes more tightly packed as the pressure increases, thus obviating all danger of leakage. They can be seen in the Market Street Cable Railway Co. building, California Cracker Co., American Cracker Co., Fireman's Fund Insurance Co.'s building, H. S. Crocker & Co., the new Oriel building, at the junction of Page and Market Streets, and in many other public buildings, factories, etc. W. T. Y. Schenck, 256 Market Street, is the patentee and manufacturer, and furnishes them for any size or quantity of hose. He is also agent for the "Eureka," "Paragon," "Red Cross," and "Eureka Mill" brands of cotton rubber-lined hose, the latter being especially adapted for inside fire protection in mills, factories, public buildings, hotels, churches, etc.

STEEL SQUARE, ITS USES, PRICE $4.00.

TRANSFER VARNISH FOR ENGRAVERS.—Take six and a half ounces mastic in tears, twelve and a half ounces resin, and of genuine pale Venice turpentine and sandarac, of each twenty-five ounces. Dissolve, add one quart turpentine varnish, agitate well, and strain.

Scarcity of Competent Draughtsmen.

ALREADY, architects are beginning to feel the scarcity of competent draughtsmen. This office is naturally looked to by the profession as the headquarters of disengaged draughtsmen; but for months there has not been on our books a single name the owner of which really claimed to possess the abilities required to well and truly delineate the plans and details of an ordinary building. Even second-rate men are very scarce, while the small army of "tracers," copyists, etc., that so infested the various offices two years ago, seem to have disappeared entirely.

The principal reason for this lack of the proper kind of talent, lies in the fact that the surrounding country has drawn off everyone who thought their condition could be bettered. The southern part of the State now has about as many draughtsmen as the northern part. Just before the holidays, architects from San Diego, Los Angeles, Pasadena, and other places, visited this office, and left *carte blanche* orders to have their wants supplied, no matter what the wages demanded were. Even with this pressing need to be supplied, but one draughtsman could be found to take the offer.

Several firms in this city have applied for the first disengaged men of whom we may hear. Repeated inquiries, however, develop the fact that there are no idle draughtsmen in this city, and none whose engagements will shortly expire. We need about a dozen more to be added to our regular corps in San Francisco.

Our Eastern friends who read this article, and who may desire to come to this place, must give serious consideration to the following facts. For nine months in the year there is a considerable amount of building going on; the remaining three months being slack months, as statistics will show. During the past year, in this city alone, 3,732 buildings have been erected at a cost of $19,648,505.

Wages vary from $2.50 to $5.00 per day, depending altogether on the ability of the draughtsman. The hours are the same as in most Eastern cities. Above all things, *do not come here with the idea that you know it all.* Our details are essentially different from those East. There, stone and brick buildings are in the majority as far as numbers are concerned. Here, the exact opposite is the case. FULLY NINE-TENTHS of the buildings in California are built altogether of wood, the chimneys and in some cases the foundations, alone excepted. We do not think in the whole State of California, that there are fifty buildings on which stone "trimmings" are used, and yet there are buildings costing up in the hundreds of thousands. So a new draughtsman must be prepared to spend a little time in studying our details.

Should anyone desire to make the Golden State his future home, we will take pleasure in informing him of the chances of employment. When writing, state age, qualifications, etc., so that ample information can be given to those who will bid you come. Be sure to state the number of years engaged in the profession, and the degree of skill to which you consider that you have arrived. No charge is made for any advice we may give.

Do not—California like—pack up and start for this place as soon as you read this article. From twelve to fifteen good draughtsmen are all we want at present. Write to this office FIRST, give all information necessary, and then wait for our answer; when you get the latter you can depend on any statements we make.

HAND IN OR SEND

Your SUBSCRIPTIONS for 1887

TO THOSE who so promptly responded to our request for immediate settlement of subscription and advertising balances,

WE SAY, THANK YOU.

To those against whose names remain unpaid balances, we say,

PLEASE PAY UP AT ONCE.

Remembering THAT—Defrauding an editor is considered one of the meanest kinds of peculation; THAT—"*Honest men are the gentlemen of nature;*" THAT—"The man who pauses in his honesty, lacks but little of the rogue;" THAT—A rogue in spirit is a rogue in gain."

Therefore,—Let every one who *receives* or *reads* this journal, forthwith forward to this office its subscription price for 1887, and any and all unpaid indebtedness.

ARCHITECTS SHOULD REGULARLY CONTRIBUTE ARTICLES TO THIS JOURNAL.

ASKED, ANSWERED, AND COMMUNICATED.

☞ Architects, Contractors, Carpenters and Mechanics generally are respectfully requested to furnish us items of interest for this column. We will gladly answer any and all questions pertaining to the architectural and building interests. If illustrations are necessary to explain your ideas, send us a sketch of them and we will make the cuts.

Free to All.

THE columns of this journal are open to all who differ with us upon any subject presented. We are too old in years and experience to assume that we have passed the reef of human liability to err, or for one moment to suppose that we have reached the realms of thought where perfection reigns supreme. But this we do assure—that whatever of error there may be contained in our columns will be speedily corrected, as soon as attention is directed thereto, and we are convinced of the error. We will give place to a reply in any case, when a mistake or wrong statement has occurred. It is our desire and purpose to be fair, just, and correct in all things, and do no person or subject any violence. We therefore invite free discussion and criticism, and again state that the columns of this journal are at the service of all who desire to differ with us upon any theory or subject, or who take exception to anything at any time appearing in our columns.

WE intend to make a specialty of this department of our journal, and, in order to make it thoroughly interesting, we desire the co-operation of all architects, mechanics, etc., whether subscribers or not. In this column there is a great opportunity for comparison of ideas on the practical questions of the day; and we hope to receive from those interested, and especially amongst builders, questions arising in their daily practice. No matter what may be the solutions given to the various problems presented, we shall only be too pleased to receive replies from our readers, where they see other and better solutions for them. If a general interchange of ideas can be brought about great advantages will ensue to all. Let not a month go by without bringing up for discussion practical topics in the architectural, mechanical, or scientifical pursuits. We desire a general expression of opinions, for or against, of every article presented by us. Every communication will receive deliberate and careful consideration.

The Right Ring in a Letter.

WINTERS, YOLO CO., Jan. 25, 1887.

To the Publishers of the CALIFORNIA ARCHITECT—

INCLOSED please find $2.50 for the CALIFORNIA ARCHITECT and a copy of MR. David Salfeld's new work entitled, "Country and City Homes."

I am glad to notice the gradual improvement in the CALIFORNIA ARCHITECT from year to year. At first I was not a subscriber, but after receipt of the first few copies, I found it indispensable and so secured the back numbers. I have now a complete set. I feel interested in the permanent success of your journal, and were I a younger man, would gladly contribute to your columns. I hope that Mr. Wolfe will *stick* to being its editor until there is a *su e* thing of having his place filled (*which, by the way, is no easy thing to do*). Respectfully,

T. D. BALL.

Thanks, Mr. B.; the years you complain of are just the best argument why you *should* contribute to our columns. Age gives experience, and the latter is the best teacher. We shall be pleased to hear from you as well as many others from your delightful county.

"STUPID" sends a communication in regard to the "Diagonal Brace Question." No name or address being given, it will lay over for the present.

Table for the Use of Nails.

THE *National Builder* gives the following table for the use of nails:—

For 1,000 shingles allow 3½ to 5 pounds fourpenny nails, or 3 to 3½ pounds threepenny nails.

For 1,000 laths allow about 6 pounds threepenny fine nails.

For 1,000 feet clapboards, about 18 pounds sixpenny box.

For 1,000 feet boarding boards, 20 pounds eightpenny common.

For 1,000 feet boarding boards, 25 pounds tenpenny common.

For 1,000 feet top floors, square edge, 38 pounds tenpenny floor.

For 1,000 feet top floors, square edge, 41 pounds twelvepenny floor.

For 1,000 feet top floors, matched, blind nailed, 35 pounds tenpenny floor.

For 1,000 feet top floors, matched, blind nailed, 42 twelvepenny floor.

For 1,000 feet furring, 1x3, 45 pounds tenpenny common.

For 1,000 feet furring, 1x2, 65 pounds tenpenny common.

For 1,000 feet pine finish, about 30 pounds eightpenny finish.

Lumber Measure. Save This Table.

BELOW will be found, in a very convenient form, a table by the use of which the number of feet in any given size of timber, can be readily and accurately obtained.

The column on the left gives the size of the timber; the figures on the top the length in feet. It will be readily apparent that any quantity can be found besides those given. Suppose the timber was 14x28, 100 feet long. This in length would be 2 pieces 30 feet long and 2 pieces 20 feet long = 1,634 feet; double this = 3,268 feet, the correct answer.

A piece 16x16=30 feet long, can be found similarly, being equal to 4 pieces 8x8 of same length.

Every mechanic should have a copy of this table pasted on the inside of his chest lid.

TABLE OF LUMBER MEASURE.

Size in Inches.	12	14	16	18	20	22	24	26	28	30

GRIMSHAW ON SAWS, PRICE - - - $4.00.

AN illustrated article by Fred Larcy, on the "Diagonal Brace Question," will appear in our next.

STEEL SQUARE, ITS USES, PRICE $1.00.

MECHANICS, and all others interested, should remember that we can furnish any books printed, at the shortest notice and the lowest prices. We have reduced the price of "SCIENCE OF CARPENTRY MADE EASY," TO $4.00.

CONTRACTORS SHOULD REGULARLY CONTRIBUTE ARTICLES TO THIS JOURNAL.

Paper Read Before the S. F. Chapter, American Institute of Architects, Feb. 4, 1887, by Fellow John Gash, Esq.

MR PRESIDENT AND GENTLEMEN: In my papers for this evening's reading, I would say by form of preface that my object is not directly to speak of the way or how plumbing should be done, as of this subject, like many others, much has been already said and written; it is rather to show the growth and progress of the sanitary system of the home, both in the comfort of the supply of water for culinary purposes, as also for the bath.

Like most of the subjects that are partially lost in the sands of time, we find dim references of both of these in Biblical lore. The tales of Abraham and Jacob watering their flocks, and their daughters drawing water from the wells for domestic use. Nor was this labor unattended by a blessing, as we read of Rebecca, the daughter of Bethuel, going to the well to fetch water, and there meeting the servant of her future husband, Isaac, a domestic romance that has and may well be read and copied by Rebecca's daughters from then till now.

The refreshing advantages of the bath are too well known to the whole animal kingdom and to man in all ages and countries, and its luxuries may be read of in the history of the Jews, Romans, Grecians, and Egyptians, and those ruins of the baths of Caracalla and Diocletian stand as monuments telling of the luxury to which the bath had been carried in those days.

But the drawing of water from the well for culinary purposes has long been abandoned, and the introduction of water into dwellings by means of piping, and the conveying of water therefrom, has perhaps occupied the attention of more persons in the present age than any other factor in building. The architect, sanitary and civil engineer, with the army of physicians, have jointly and severally handled this subject until, I am happy to say, our system of plumbing is pretty thoroughly understood, nor indeed has any foreign or European country made such advances in this as has been made in our own country; and I would say, perhaps no city in the Union can boast of as thorough a system of plumbing as we can in our own city of San Francisco, without, of course, any reference to its sewerage, which, perhaps, runs to the other extreme, and can scarcely be found any worse.

For many centuries physicians had a practical monopoly of what little was known of the conditions affecting the public health, and there seemed to be no incentive to original investigation and experiment, even if the means of prosecuting an inquiry so important to all classes of the people, had been at the command of those who, under more favorable circumstances, would doubtless have made important contributions to the literature of plumbing.

To the medical profession we owe the greater part of what has already been learned and placed on record, of the truths which form the basis of sanitary science. Indeed, so strongly has this matter been taken hold of by the public mind that they no longer attribute the visitation of the "Angel of Death" to the "afflictive dispensations of providence" which are so mysterious and past finding out.

People often wonder why we do not have such fearful visitations of epidemics at the present day—as the plague of London, the ancient spotted fever, sweating sickness, etc.—yet we have outbreaks of cholera, yellow fever, and typhoid, with other diseases, which may be traced to that most deadly foe of the household, sewer gas, which stealthily creeps through our house through the night, and midst the dazzling splendor of the beautifully draped parlors and rich and modern upholstery, leaves its deadly trail, whose odor is inhaled by some dear member of the household, perhaps a loving child, a fond parent, or an affectionate brother or sister.

This foe of the fireside, you gentlemen, as architects, should most assiduously battle against.

When you hear of persons desiring to have their houses filled up with all the modern conveniences, so-called, bear in mind an unseen stranger as above referred to, may be also introduced.

By sewer gas I mean the gaseous emanation from decomposing sewerage which, when it mingles with the confined air of our unventilated living and sleeping rooms, retains its terrible power for mischief long enough to do its deadly work effectually. And here I would say the worst features of sewer gas poisoning are very often found where sewer gas proper does not penetrate.

In most houses the so-called sewer gas, which is both a nuisance and a danger, is chiefly manufactured on the premises, and does its fatal work none the less effectively because it is called by a wrong name. The worst defects of the commonest plumbing done by contract are rarely noticed in new houses.

All the sewer connections are made that ever will be made, but we pass from room to room without noticing any unpleasant smell, and therefore never suspecting danger. When the pipes are fouled by the waste of the house, the trouble begins, and it increases from month to month, and year to year, as the foulness within the waste pipe system accumulates, and until the gaseous products of decomposition within pipes are prevented from mixing with the air we breathe in living and sleeping rooms.

From the most careful analysis of sewer gas, it shows that it is composed chiefly of carbonic acid, nitrogen, sulphurated hydrogen, and some fetid vapor. The elementary gases and those of known compositions which are commonly found in sewers and unventilated cess-pools, though mostly capable of destroying life under favorable conditions, are not considered responsible for much, if any, of the fatal effects properly attributed to sewer gas. Carbonic acid is the gas usually found present in greatest volumes in sewers, both ventilated and unventilated.

The proportion as determined by analysis varies according to circumstances, but it is usually large. This gas is an invariable product of the decomposition of all substances containing carbon. Inhaled in concentrated form it quickly produces death, and even when considerably diluted with atmospheric air, produces asphyxia, and unless the victim is quickly rescued from its influence, death follows promptly. It does not readily leave sewers and cess-pools, however, owing to the fact that its specific gravity is considerably greater than the air, and so much of it as would naturally find its way into a house from a sewer or cess-pool, has been proved beyond a reasonable doubt to cause typhoid fever.

In one case in the town of Croydon, where the gas was known to have entered the house, it did not smell offensive, only a faint, sickly odor being recognized. In this case the gas was driven into the house by a shower filling the conductors with water. The problem of the present age seems to be the thorough ventilation of sewers, and so many ways and means have been suggested that a description of even a few of them would be more than my paper would allow; but the most universally adopted seems to recommend "man-holes" in our streets, covered with gratings as open as might be consistent with strength, and these kept free from street cleanings; and to oblige every house-owner to vent his soil pipe (unobstructed by any form of trap along its line) to a point above his roof; the ventilation of sewers might be a success. The stopping of sewerage by the incoming tide, etc., the difficulties attending steep grades, and other such obstructions to be met in many cities, would admit of many theories, a paper on which, by one of you gentlemen, would be, I am sure, warmly received by our Chapter.

But the sanitary conditions of cities and towns nowadays, and those of a couple of hundred years ago, are very gratifying. After the fall of the Roman Empire to the end of the Middle Ages the people of Europe may be said to be unwashed. Of Paris it is recorded, by Rigord, physician to Philip Augustus, that one day looking from his window, he saw a carriage passing, and the substance forming the streets being stirred up by the revolution of the wheels, emitted a stench so powerful as to overpower the king. This so disgusted him that he urged the citizens to pave the streets, and to assist in the purification of the city he built walls round the cathedral to prevent it from remaining any longer a common corner for convenience.

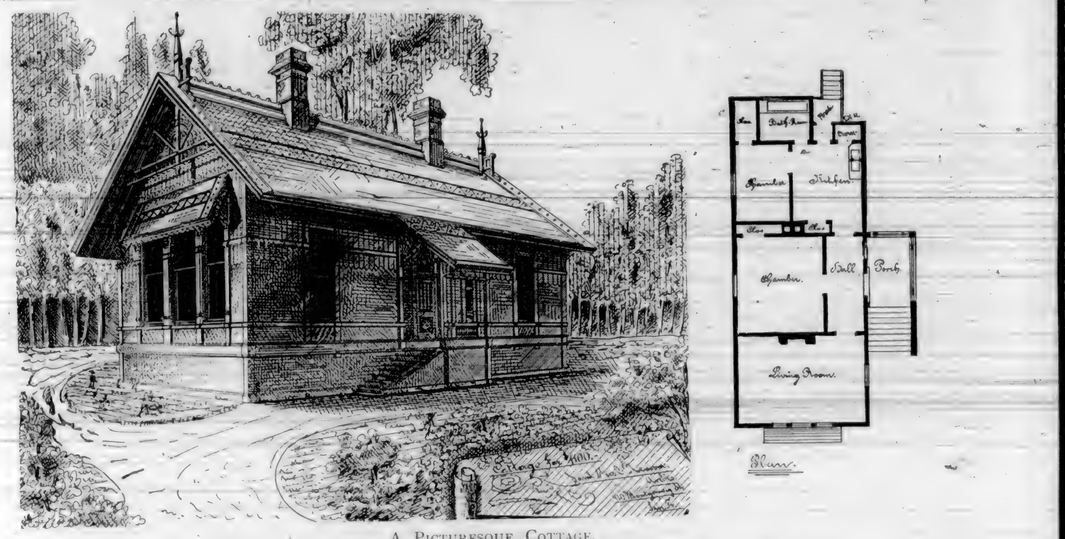
Nor was the city of London any better. A writer of the period says that the streets around St. Paul's were covered with horse manure a yard deep. Floors were of clay, covered with rushes which grew in the fens, and which were so slightly removed now and then that the lower part remained for many years undisturbed and in it such a collection of foulness as only can be found in a scavenger's dog-cart. Cleanliness of the person was a thing almost unknown.

One old writer says the better classes of people wore clean garments on the outside, but the inner ones were often worn until they fell piecemeal away from their unwashed bodies.

Comparing this account with the advance the present generation has made in cleanliness, we bring as if ourselves to that age in which Rome could so boastingly speak, amongst other things, of her aqueducts for water supply, her public baths, giving facilities to her citizens to take at the rate of 70,000 baths per day. A revival of the luxury of the bath, known under the name of Roman, Turkish, Russian, German, Jewish, Medicated, Vapor, Hot Air, Gas, and Animal Baths, have become almost universal in our own age and time. Many of which are well represented in our own city.

The continuation of my papers on "Baths, Ancient and Modern," their history, manner of construction, the ancient and modern system of heating, the luxury of the baths of Caracalla, Titus, and Diocletian, their arrangements adorned with the most valuable column paintings and statues; in a word, for every

OUR MARCH ISSUE WILL BE REPLETE WITH INTERESTING INFORMATION.



A Picturesque Cottage.

species of polite and manly amusements,—to give them any sort of a description would, in fact, require another paper with this, when I will be able to furnish with them a few drawings, showing their internal arrangements, and sections showing their mode of heating such quantities of water, etc.

Warner's Hangers.

IT is a pleasing duty to bespeak attention to one of the most ingenious of modern architectural conveniences, a device, indeed, which justly claims rank among the necessities of home building.

Warner's Patent Sliding Door Hangers, owned and manufactured by E. C. Stearns & Co., Syracuse, N. Y., are as nearly perfect in producing the effects desired by their use as human ingenuity may hope to achieve.

That over 100,000 sets of these hangers are now in use, that some 1,200 leading architects accord them an unqualified approval, are but the logical sequence to established merit.

The main features of "Warner's" are too well known and appreciated to need more than a bare summary. They obviate cutting the carpet; do away with the floor rail; always remain on the track; are easily adjusted to shrinkage; are entirely concealed, and run so true that the heaviest doors are easily moved.

"Warner's" is the pioneer hanger in the market. It has suggested numerous imitations which have done valuable service to the public by advertising the original; for the sale of Warner's is at present greater than the combined product of its many competitors.

In a word, Warner's Patent Sliding Door Hangers completely and perfectly fill a great public need, and admit of no rivalry, because they exactly and economically produce the effects required.

Thermometers.

PERHAPS not one in a hundred can tell off-handed why a point thirty-two degrees below freezing point on Fahrenheit's thermometer is called zero. For that matter, nobody knows. The Fahrenheit scale was introduced in 1720. Like other thermometer scales, it has two fixed points, the boiling point and the freezing point, or rather the melting point of water. The Centigrade and Reaumur scales call the freezing point zero, and measure therefrom in both directions. Fahrenheit kept the principle on which he graduated his thermometers a secret, and no one has ever discovered it. It is supposed, however, that he considered his zero—thirty-two degrees below freezing—the point of absolute cold or absence of all heat, either because, being about the temperature of melting salt and snow, it was the greatest degree of cold that he could produce artificially, or because it was the lowest natural temperature of which he could find any record. The grounds on which Fahrenheit put one hundred and eighty degrees between the freezing and boiling points are likewise unknown.

A Picturesque Cottage.

OUR engraving portrays a one-story cottage very conveniently arranged for a small family. The hall is so situated that easy access is obtained to all the principal rooms. If found necessary a fire can be had in every room, the chimneys being so placed that accommodations in this line are very convenient. The elevation is plain, but just suited to those whose purses are not of the longest. As shown, the house, with present prices of materials, can be built anywhere from $1,250 to $1,500.

Useful Hints in Building.

SEE that chimneys are built on good stone foundations; settlement will be avoided and one of the causes of unexplained fires will be removed.

Do not finish windows to the floor; the circulation across the floor is one of the causes of cold houses.

Stops to doors and windows should be fastened with round head screws, so as to be easily moved.

Do not construct solid doors of two kinds of hard wood; the action of the atmosphere on one or the other will cause the door to warp.

In building book-cases let there be a half-inch space between the back of the shelf and the wall; dust can then easily be brushed back, falling to the bottom.

Do not locate a furnace register next to a mantel, that is, if you wish to utilize the heat.

Do not build a cistern in the cellar of a house unless you wish to generate unhealthy atmosphere.

A closet finished with red cedar shelves and drawers is death to moths and insects.

Porch floors should be of narrow stuff and the joints laid in white lead.

The ceilings of closets may be made lower than the apartment adjoining; it saves plastering.

A ventilating flue from the kitchen into the chimney often does away with atmospheric meals.

In building frame houses, fill the studding one foot high above the sill with brick; this discounts the use of rat traps.

Ash pits in cellars under fire places and mantels save taking up ashes, for they may be raked down through a hopper.

Plaster cornices and center-pieces are relegated to the past. Paper and fresco work is the proper thing.

Sliding doors into small apartments are to be preferred in place of folding.

Don't inclose the sink; no place in a kitchen is so much neglected.

Do not use one chimney flue for two stove-pipes; the draught of one will counteract that of the other.

Lime water is a fire-proof protection for shingles or any light wood-work.

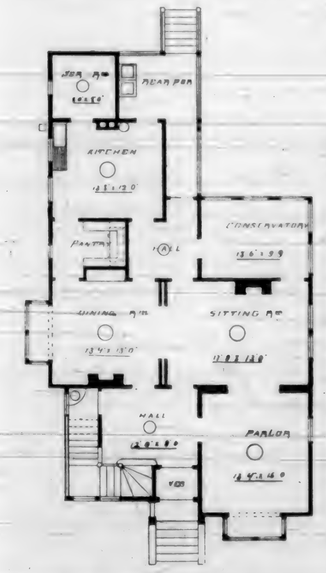
BOUND VOLUMES OF 1886 ARE NOW READY. PRICE $2.50 EACH, POST-PAID.

Perspective Elevation of a Country or Suburban Dwelling. D. Salfield, Architect.

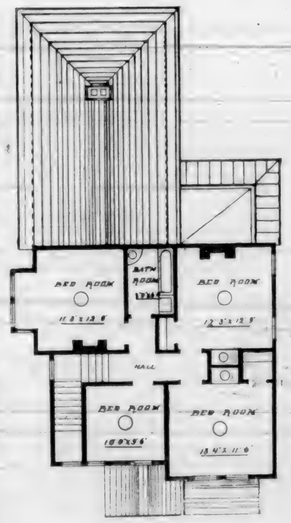
The accompanying plans below, and the perspective above, illustrate a design for a nine-room suburban or country home, suitable for a small refined family wanting all the privacy and elegance of a first-class dwelling, and yet embodied in a small space without any great outlay or expense.

The broken outline of the building, with gables in every direction, finished with fancy shingling, carved brackets, ornamental finials, and high pitched roof, and the square bay-windows on the front and on the side, would make a very picturesque, attractive building, if surrounded by shade trees or shrubbery. A careful examination of the floor plans will show at once the convenience and beauty of arrangement. The front entrance door opens into a large hall, with the parlor on the right, and doors communicating with dining and sitting-rooms in front. A beautiful conservatory, with glass sides and roof, opens off the rear hall and sitting-room.

The cuts illustrating this article were kindly furnished us by David Salfield, architect, whose office has lately been moved to 339 Kearny Street.



First Floor Plan.



Second Floor Plan.

Architects, Attention!

We want every architect on the Pacific Coast to contribute a short article for the March number of this journal. It should be your aim to make your home journal interesting to all who may read it, and there is no surer way to obtain this end than by each one writing a short article. Illustrate it, if need be; we will make the cuts. Be sure that the articles reach this office by the 5th of the month.

To Contractors.

What contractor in the city but knows of some little idea that would be beneficial to our readers. Help to build up this journal by a free interchange of thoughts. It will pay you tenfold to be in communication through our columns with all the master mechanics of the Pacific slope. Do not let the thought enter your mind that you cannot write well enough. Do the best you can, and we will see that your ideas are presented in proper shape.

Apprentices.

When you have found out any ideas that should be known by every one, forward them to us, and we will publish them under your own names, that others, hearing of your good deeds, may go and do likewise.

TREDGOLD'S CARPENTRY,
Price, - - - - - - $7.50.

ARCHITECTS SHOULD REGULARLY CONTRIBUTE ARTICLES TO THIS JOURNAL.

COUNTRY
BUILDING INTELLIGENCE

In this and succeeding issues we intend to devote considerable space to information in connection with buildings, from every portion of the coast.

Only reliable news will be found in this column. Our custom has been for the past eight years, to furnish only data which could be relied upon. We will not publish rumors of "THIS AND THAT IS GOING ON" unless we are reasonably assured that such is truly the case. We have been busy the past two months in perfecting arrangements by which we can secure information from every portion of the Pacific slope. In all cases we will file our authority for any statements made in this column. No doubt mistakes will sometimes occur, but these we intend to be a rare exception to our rule of reliable news.

For eight years there has appeared in this journal, building news from every portion of the country. But in its condensed form it did not attract the attention it deserved. We begin the New Year by making a specialty of the item mentioned.

We desire the co-operation of country editors and mechanics to this department of this journal. By spreading the news of building engagement in your part of the country, you enhance the value of your section by proclaiming it a go-ahead community.

Architects should also notify us of "plans to figure on;" we do not charge anything for the insertion of such notices. Remember this journal is in the EIGHTH YEAR of its existence, and is the only journal published this side of the Rocky Mountains in the interests of Architects, Contractors, and Material Men.

Alameda.

J. Maristany is erecting two six-room cottages on Alameda Avenue. Cost, $4,500.

Hand Railing and Stair Casing, for $1.50.
Drawing for Carpenters, for $1.75.

Mrs. Bromley will soon erect a new building on Everett Street.

Painter, Gilder, and Varnisher, for $1.50.
Architects' Companion, for $2.50.

Henry Godfrey has contracted for a $2,500 brick building.

Manual for Furniture Men, for $1.00.
Common-Sense Church Architecture, for $1.00.

Fresno.

Mr. Timothy Paige is about to erect twenty cottages in the western part of town.

Woodward's Farm Homes, for $1.00.
Woodward's Graperies, for $1.00.

Wm. Pool and Robt. Minto are building handsome residences near town.

Practical Perspective, for $5.00.
Woodward's Country Homes, for $1.50.

Haywards.

John H. Boden is about to erect a $3,600 dwelling.

Lumberman's Hand-Book, for $2.00.
Practical Geometry, for $1.00.

Los Angeles.

A large building for a passenger depot will be shortly commenced for the A. T. & S. F. Railway Co. It will be of brick, and two stories high. A large freight depot will also be built near the above. The latter, however, will be of frame.

Artistic Homes, for $3.50.
Modern House Painting, for $5.00.

For the winter season there is a vast amount of building going forward. Residences continue to spring up all over the expansive area of the city, which embraces thirty-six square miles, as if by magic. There are not less than two hundred new homes now in course of construction in the municipality. Many of these are very elegant edifices, each of which will cost a great deal of money. Foremost among such are Mr. W. T. Lambie's new house, which covers a sightly knoll in the extreme east of East Los Angeles; the new mansion of Mr. A. Classell, on Fort Hill; and still another in close proximity to this, the Badbury palace, on the hill at the corner of Court and Hill Streets; the residence of Mr. Tyler Longstreet, and that of Mr. A. H. Judson nearly side by side in the Dana Tract on Figueroa Street. The cost of these will range at from $10,000 to $30,000 each.

In business blocks, there are notably the improvements made by Mr. Hellman and Colonel Baker, near the new post-office, which embrace a vast area of space between Main and New High Streets, at the intersection of Sonora Street; the great blocks of brick buildings going up at the corner of Main and Second Streets, for Mr. Newell and others; the big block to cost $80,000 for the Los Angeles Improvement Company on the corner of Second and Fort Streets; a new block on the corner of Upper Main and Walters Streets, for W. A. Clinton; the giant block for Louis Phillips on the corner of Spring and Franklin Streets; a small brick block on the corner of New High and Marchessalt Streets; the large block for Martin Bastincherie on the corner of Commercial and Wilmington Streets. Less magnificent buildings, both for residence and business purposes, are going up all over the city, in all parts. These remarks apply equally to East Los Angeles, Boyle Heights, the hills west of the city, the plains near the river, the region around the University in West Los Angeles, and all the sections that lie between these quarters of the municipality.

As to the future, the architects say the prospect is most excellent. They are ready to gamble heavily on the proposition that there will be more bricks laid in the year of grace, 1887, than were laid in its predecessor, within the city of Los Angeles. This is without reference to the new county Court House, of course.

Plaster, How to Make It, for $1.00.
Shavings and Sawdust, for $1.50.

R. B. Young, architect, is preparing plans for a new building for John Wigmore.

Science of Carpentry, for $4.00.
Universal Assistant, for $2.50.

Modena.

Collections are now being made for a new church building at this place.

Building Superintendence, for $3.00.
American Cottage Homes, for $3.00.

Monrovia.

A two-story building, to cost about $4,000, has just been commenced; Johnson & Parker, owners.

American House Carpenter, for $5.00.
Cutting Tools, for $2.00.

Combs & Banning will shortly commence the erection of a business block.

Every Man His Own Mechanic, for $3.50.
Tredgold's Carpentry, for $7.50.

Rev. J. B. Greenfield, A. Fell, Stewart & Perham, John Thomas, and others, are all contemplating building in the spring.

Builders' Companion, for $1.50.
Builders' Work, for $5.00.

Baptist and Methodist Churches are under way, and also a planing mill.

Builders' Construction (three volumes, very fine), for $14.00.
People's Cyclopedia (three large volumes), for $20.00.

Monrovia is in Los Angeles County.

Lumberman's Hand-Book, for $2.00.
Practical Geometry, for $1.00.

Piedmont.

The inhabitants of this place are much elated over the prospects of having a new $100,000 hotel building.

Cutting Tools, for $1.50.
Cummings' Details, for $5.00.

Pasadena.

J. E. Howard has about completed arrangements for a $10,000 residence.

EACH SUCCESSIVE NUMBER WILL BE COMPLETE IN ITS BUILDING REPORTS.

Album of Mantels, for $8.00.
History of Architecture, for $15.00.

Milton Stratton, Dr. Whittier, and J. P. Day, have each purchased property, which they intend to improve in the spring.

Drawing for Stone Masons, for $1.50.
Building Construction, for $1.25.

Pacific Grove.

A large new hotel building will shortly be erected at this place.

Drawing for Bricklayers, for $1.50.
Drawing for Cabinet Makers, for $1.50.

Petaluma.

Mr. Gerkins intends shortly to build a house on corner of Fifth and D Streets.

Artisan, for $5.00.
Builders' Guide, for $2.00.

San Diego.

According to the papers here, active work is steadily in progress for the new hotel to be erected on Coronado Beach.

Artistic Homes, for $3.50.
Modern House Painting, for $5.00.

Suisun.

Extensive repairs are being made to the Catholic Church.

American House Carpenter, for $5.00.
Cutting Tools, for $2.00.

San Bernardino.

The contract for the new Stewart Hotel has been let to Gee Brothers. Consideration, $62,263. In our last issue we gave Mr. Keefe the credit for the job, but, as he failed to give bonds, Gee Brothers at once qualified. Total cost of the building will be about $65,000.

Grimshaw on Saws, for $4.00.
Mechanics' Geometry, for $4.00.

R. E. Davis is erecting a $2,800 dwelling.

Artisan, for $5.00.
Builders' Guide, for $2.00.

San Buenaventura.

Dr. Cody has completed a contract with J. C. Capito, for a nice dwelling.

Album of Mantels, for $8.00.
History of Architecture, for $15.00.

Sebastopol.

Plans are being prepared for a new hotel for Messrs. Barnett & Co.

Science of Carpentry, for $4.00.
Universal Assistant, for $2.50.

San Jacinto.

F. M. Porter is preparing to build a $6,000 brick building.

Building Superintendence, for $3.00.
American Cottage Homes, for $3.00.

Santa Monica.

The Episcopal Church Society have already secured $2,500 towards their proposed new building.

Limes, Cements, and Mortars, for $4.00.
Wonders of Art, for $1.25.

Stockton.

About $6,000 has been subscribed towards the erection of a $30,000 agricultural pavilion in this place.

Ruskin's Works (four volumes), for $6.00.
Industrial Drawing for Carpenters, for $2.00.

San Jose.

H. Grees and R. Emmett have been buying property upon which, in the spring, they will erect desirable residences.

Plaster, How to Make It, for $1.00.
Shavings and Sawdust, for $1.50.

The residents of this place are much elated over the prospects of a fine large hotel to be built at this place. The sum mentioned for its construction is not less than $300,000. James Phelan is the moving spirit in regard to the enterprise.

Architecture and Building, for $3.50.
American Cottage Building, for $3.50.

Tyler Beach proposes to erect a $50,000 building on St. John Street.

Mural Painting (new), for $3.00.
Home Hand-Book, for $10.00.

Selma.

A new hotel has just been commenced. It will be three stories high, and front 120 feet on two different streets.

Practical Perspective, for $5.00.
Woodward's Country Homes, for $1.50.

Tulare City.

Brick building. Owner, G. W. Weybert; architect, H. D. Mitchell. Cost, $40,000.

Hand Railing and Stair Casing, for $1.50.
Drawing for Carpenters, for $1.75.

Mexican Windows.—Mexicans seem to entertain the idea that windows were made to look in at as well as to look out of, and it is a matter of daily occurrence for men, women, and children of the *gamin* order, including peddlers and professional beggars, to congregate outside the bars and stand calmly staring in at us by the hour. The first sight of these barred windows strikes the stranger in Mexico rather unpleasantly, and he is apt to fancy himself in prison behind them, with his iron bedstead and brick floor for suitable accessories. In time, however, he realizes not only the conveniences, but the necessity of them, and by and by feels an uneasy sense of insecurity if by some rare chance he finds himself not thus protected. The greater portion of Mexico is a land of perpetual summer, where windows must be open both night and day, and these gratings cannot be "picked" like locks, or noiselessly cut like panes of glass. But though one may sleep here in perfect security without closing a shutter, it is well to move one's effects from proximity to the windows, for the *ladrones* have a habit of throwing in ropes with hooks attached and dexterously drawing out even your garments—from which practice, perhaps, originated the Texan slang word "hooking," for stealing. It is only justice to add that there is far less thieving going on in Mexico, in proportion to population, than in our own country, for the influence of Roman Catholicism is paramount, especially among the poorer classes. I venture to assert that with all your spring-bolts and careful precautions to bring in even the door-mats at nightfall there is more stealing done in any Northern city in a single day than in all Mexico in a year's time.—*Quo.*

CARPENTERS' STEEL SQUARE AND ITS USES, PRICE $1.00

Walnut oil gives new oak the effect of old.

Common brick absorb a pint of water each, and make a very damp house.

The lowest priced builder is not always the cheapest, as poor work will testify.

In arranging the openings of a room, do not forget the wall space. It is sometimes advisable to build a house to suit the furniture.

Terra cotta flue linings are a great improvement over the old roughly plastered chimney.

To properly select the colors applicable to the proper place, consult an educated painter.

Deceptive and Misleading Specifications, and Consequent Unjust Practices.

PARTIES claiming to have been unfairly dealt with in the letting and execution of certain branches of mechanism in connection with a prominent frame building now in course of erection in this city, have sought to ventilate their grievances through the columns of the daily journals, for the purpose of exposing wrongs claimed to have been perpetrated in the specifications as compared with the work as executed—the material and workmanship as done and furnished being inferior, and of much less value than required by the letter of the specifications.

While some of our contemporaries have published articles based upon the matter above introduced, they have departed from the true issue involved, and indulged in severe language, intimating or asserting—"building frauds," "cheating owners," "collusion," "robbery," "cinched," etc.

To what extent these accusations may be sustained by existing facts, it is not our purpose now to discuss, as it would require several pages, if not several volumes, of this journal to contain all that might be written in this connection without conclusively settling the debatable question as to who is most to blame for the state of things said to exist,—owners who are poised as the unsuspecting, helpless birds, whose pockets are plucked of their golden plumage, or the men employed by the innocents as architects and contractors. Owners, actuated by right and honorable motives and purposes, who are so unfortunate as to fall into the hands of "scalpers," either as architects or contractors, are to be sympathized with; but when, from the promptings of avarice, penuriousness, and mean economy, they place themselves in the power of men whose most prominent if not only recommendation is *cheapness*,—men who neither know nor care for the high standard of integrity which should be pre-eminent with, and actuate those practicing the profession of architect, they willfully do an act which deserves no other style of commiseration than that usually bestowed,—"*It serves them right.*" The spirit underlying all such transactions is, diamond cut diamond; yet if the promoters of bad results—owners who employ men whose chief qualifications are their glib tongues and indiscriminate assertions and promises to do impossible things—happen to come off second best, then no language possible is sufficiently severe to portray the villainies of the *rogues* that win the game.

In the issue introduced by this article, the statement is made that the specifications for the several branches of workmanship and materials to be used in the construction of the building referred to, required qualities which would have cost the contractor very much more than those permitted to be used by the successful bidder; that both the workmanship and materials used are of a kind differing widely from those specified, and that thereby those who figured squarely and honorably by the specifications, with the intent of strictly carrying out, in execution, the fair and true meaning and requirement of the written document, were misled, deceived, and consequently defrauded.

The principle involved in this matter is, that in all cases of fair competition, every man asked or permitted to figure, should be placed upon equal footings, and the specifications should plainly state, exactly and fully, just what is to be, and will be, required, without any reserve of advantage to any party whosoever, either in workmanship or material, unless it is plainly made known to every competitor that a preference will be given. If this is not done, and the bidding purports to be untrammeled by any consideration other than what appears in the specifications, then any advantage given to any one of the number figuring, becomes an act of injustice, at which defeated contestants have good cause of complaint.

The right of owners or architects to prefer individual operators, cannot be questioned; but neither is justified by any rule of right or fair dealings, to draw upon the time and skill of others for certain subordinate reasons, to examine plans and estimate values, with all the chances of success adverse to the parties so drawn upon. It is not a fairly admissible proposition that, "we want A, B, C to figure as a guide to determine whether D, our favored man, is not taking advantage of his preferred position"—unless the parties used for this purpose are paid fair remuneration for the loss of time and skill consumed in such figuring.

In cases where competent and responsible men estimate upon work offered in competition, and figure to follow faithfully the requirements of the plans and specifications, they have good, sufficient, and just grounds for complaint, when they find that the party to whom the work shall have been let, have been allowed privileges and abatements in cost of execution, not made known to all others estimating on the work at the time of bidding. Fair competition deals alike with all in interest, and private information to, and secret understanding with, any one party, can be considered only as an unfair and unjust transaction.

Draughtsmen in Demand.

ALL draughtsmen out of employment will do well to read an article in this issue in reference to the want of draughtsmen. Give close attention to the same. Fully fifty more than our usual corps can find remunerative employment. The prospects this year are decidedly encouraging for a large amount of work in the building line. In the article in question, please note that it is *architectural draughtsmen* who are required and not carpenters or architects.

CONTRACTORS, ATTENTION!

For $5.00 we will insert your business card for one year, and send you this Journal, free.

Pressing Need of Competent Draughtsmen.

THE article in our last issue entitled "Scarcity of Architectural Draughtsmen," has attracted much attention, and many inquiries have been sent to this office in regard to chances of employment.

CARPENTER SKETCHMEN NOT NEEDED.

A large proportion of the letters received are from carpenters who consider that their experience as practical mechanics, aided by a faint smattering of the knowledge of draughtsmen, will enable them at once to enter an architect's office as first-class men. Such men are not the kind that are needed.

ARCHITECTS NOT WANTED.

Neither do we care to receive letters from those who call themselves architects, and who are continually writing for the formation of desirable partnerships. There are enough architects here now, and many to spare.

COMPETENT DRAUGHTSMEN NEEDED.

Young men who have made a study of the profession, and who know themselves that they possess a fair amount of ability as designers, and who are willing to allow that they do not know it all, are the kind of help that is very much needed, not only in this city, but in several of the principal towns on this coast.

CONTRACT DRAUGHTSMEN NOT NEEDED.

This city is the abiding-place of a few architectural rovers—a good name for them—who will not enter an architect's office unless a contract is made between the architect and rover, by which the former is bound to employ the latter a certain length of time at specified wages. No chance is given to employ the said rover for a week to test his ability, but upon the strength of his saying he can do this and that he must be, perforce, installed, at once as leading draughtsman in the office. Such men are *not* wanted.

A TRUE TEST.

Men are desired who, upon applying for a situation, can be conducted to the draughting table, furnished with the proper subject, paper, and instruments, and at once comprehend the architect's ideas, and proceed to exemplify the same in a practical manner. Such men *are* wanted.

NUMBER WHO CAN FIND EMPLOYMENT.

From present appearances we know of places that will absorb about twenty applicants. Everything looks favorable for steady employment for some time to come. Many of the country architects will engage men for a specified time, provided they possess the requisite ability.

REMUNERATION

Varies considerably, depending altogether upon the ability of the applicant. Four dollars per day, may be given as the average price of good men. Some men are cheap at $6.00, or even $8.00 per day. Some are dear at $1.00. Young men who have been but a few years at the study, should be content with $2.00 and $2.50 per day. Monthly rates run from $50 to $125, according to talent.

INQUIRIES ANSWERED.

We will answer all inquiries addressed to us in relation to the subject under consideration. No charge is made for any information, but we consider that the least anyone can do, is to inclose stamps for return postage. A half dozen stamps amount to but little, but when we are called upon to furnish them by the hundreds, it becomes another matter. We can only answer those to which our attention is particularly interested, if stamps be not inclosed for return postage.

WRITE FIRST

Before starting. At least ten can be put immediately to work. We do not wish to be the means of having scores of men come here and be disappointed upon their arrival. Write first to us for particulars, and then you will have a positive guarantee that you will be employed if we bid you come.

CONTRACTORS, ATTENTION!

For $5.00 we will insert your business card for one year, and send you this Journal, free.

Our Quarterly Report.

ALTHOUGH buildings, in neither value nor number, equal the corresponding time of last year, still we are free to admit that the prospects are more encouraging for a large amount of work to go ahead than was evidenced last March, one year ago.

In 1886, for the first quarter of the year, we reported in this journal 252 engagements, valued at $1,359,532. For the same time this year we report 191 buildings, valued at $1,209,100.

REPORT FOR MARCH.

65	frame buildings, value	$221,500
9	brick " "	105,500
10	improvements "	26,900
84		$353,900

Several large buildings will soon be started, and we are confident that our next quarterly report will show a much better comparison with those of former years.

Meeting of the San Francisco Chapter of Architects.

THE regular session was held on the evening of the 4th inst., A. Pissis, President, presiding. In the absence of B. G. Henricksen, Secretary, a member was appointed Secretary *pro tem.*

Roll call, reading and amendment of minutes followed.

Mr. Saunders reported progress in the class work, stating that there was a far too great lack of interest on the part of students from the several architects' offices, in availing themselves of this valuable auxiliary to their advancement in the study of architectural science.

The fire ordinances of San Francisco, relating to the construction of buildings, was taken up and freely discussed and reveiwed, and the unanimous opinion of every member present was, that the ordinances relating to the erection of buildings, in numerous particulars, required remodeling and reconstruction.

The discussion was free and spirited, and the defects reviewed without any reflection upon those who, years ago, suggested and framed the ordinances as they now are, which were then suited to the occasion, but which time and experiences have proven defective and insufficient for the regulation of the building science at the present day.

In view of these facts, a committee, consisting of John Wright, James E. Wolfe, J. Clark, H. S. Bestor, and W. P Moore, was appointed to take the matter of the fire ordinances as far as the *construction of buildings* is concerned, into consideration, and to report thereon at as early a day as possible. The proposition extended no farther than the simple matter of *building construction*, in connection with which the laws, as they now stand, are inadequate and impractical in numerous respects.

The Law as to Party Walls.

A PARTY wall is the wall dividing lands of different proprietors, used in common for the support of structures on both sides. At common law an owner who erects a wall for his own buildings which is capable of being used by an adjoining proprietor, cannot compel such proprietor, when he shall build next to it, to pay for any portion of the cost of such wall. On the other hand the adjoining proprietor has no right to make any use of such wall without consent of the owner, and the consequence may be the erection of two walls side by side, when one would answer all purposes. This convenience is often secured by an agreement to erect a wall for common use, one-half on each other's land, the parties to divide the expense; if only one is to build at the time, he gets a return from the other party of half what it costs him. Under such an agreement each has an easement in the land of the other while the wall stands, and this accompanies the title in sales and descent. But if the wall is destroyed by decay or accident, the easement is gone, unless by a deed such a contingency is provided for. Repairs to party walls are to be borne equally; but if one has occasion to strengthen or improve them for a more extensive building than was at first contemplated, he cannot compel the other to divide the expense with him. In some States there are statutes regulating the rights in party walls, and one may, undoubtedly, acquire rights by prescription on a wall built by another, which he has long been allowed to use for the support of his own structure.—*Building.*

REMOVING PAINT.—An excellent medium for removing paint-spots from garments and like fabrics, may be had by mixing four tablespoonfuls of alcohol with a tablespoonful of salt. Shake the whole well together and apply with a sponge or a brush, then wash out in clean, tepid water.

An Eastlake Cottage.

IN presenting this design, attention is called to the compactness and beauty of arrangement of plans, well-proportioned rooms, no unnecessary waste of space occupied by long, gloomy halls, and each door and window having its distinct purpose or cause.

The design, as illustrated, is a model of compactness and arrangement. On entering the hall from the vestibule, the parlor and dining-room are situated on the right, separated by a neatly designed, paneled sliding-door, and each room having a large bay-window, with an ornamental arch. On the left of the hall are entrances to two bedrooms, with a bath-room between them, and each room provided with a large closet with shelves, drawers, hooks, etc., usually found in closets.

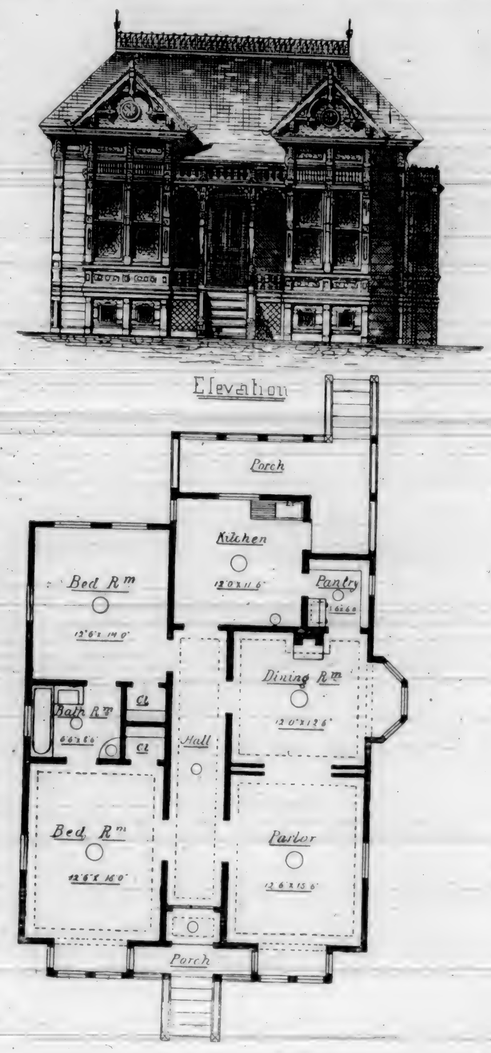
The bath-room contains a wash-stand with nickel-plated bibbs, and a Golden Gate plug water-closet, finished in black walnut and nickel-plated trimmings. The bath-tub is provided with hot and cold water, through nickel-plated bibbs, with attached soap-cups; the room is wainscoted five feet high and finished with moulded cap and paste-board.

The floor should be covered with linoleum, giving the room a neat appearance, and making it easy to clean. The kitchen is provided with a sink, boiler, and a large paste-pantry; and a commodious rear porch, inclosed by posts and railings, affords a good place to do washing, cleaning, etc.

The dining-room is finished with paneled wainscoting, and all the wood-work finished in oak and highly polished. The dining-room should be papered with some neat floral design, and the floor covered with a carpet harmonizing with the rest of the furniture.

The windows are furnished with sliding blinds, which slide in the casing, thus preventing the tearing of curtains and lambrequins. One chimney suffices for a fire-place for the dining-room, and a separate flue for the kitchen. The elevation is of Eastlake style, and needs very little description, as a glance will show that it is neat in design, and solidly constructed. The roof is covered with the best quality of redwood shingles, laid four and a half inches to the weather, and well nailed.

DAVID SALFIELD, *Architect.*



AN EASTLAKE COTTAGE.

NEW ADVERTISEMENTS.

Sure Sign of an Unqualified Success.

THAT this Journal is an assured success, is proven by the large number of advertisers that have kept their wares before the public by means of notices in these columns. We call special attention to the following NEW ADVERTISEMENTS in this issue:—

Wooden Mantels—

The West Coast Furniture Company, under the supervision of L. and E. Emanuel, stand at the head of any firm in the State, in the preparation of artistic designs for Wooden Mantels. SEE NEW ADVERTISEMENT.

Ransome's Pavements, etc.—

This industrious inventor in cement and concrete work will fully explain in next issue why the space occupied by him will contain information of interest to all who contemplate building. SEE NEW ADVERTISEMENT.

Wire Lathing—

J. H. Roebling's Sons Company, 14 Drumm Street, are prepared to furnish in quantities to suit, their Patent Stiffened Fire-proof Wire Lathing. They also keep Sash Cord, Wire Rope, etc. SEE NEW ADVERTISEMENT.

Plumbers' Slabs—

Plumbers and others will do well to call on E. Dumontelle Steam Marble Works, 523 Fifth Street. Slabs, Marble Mantels, Furniture Marble, and everything in that line on hand or worked to order. SEE NEW ADVERTISEMENT.

Plumbers' Supplies and Gas Fixtures—

Nye & Co., carry the largest stock of any firm on the Coast. In fact but few firms in the United States can show the profusion of artistic designs in Gas Fixtures, that are displayed in the warerooms of Nye & Co., in the Grand Hotel Building, Market Street. SEE NEW ADVERTISEMENT.

Cement—

The Dyckerhoff-Portland Cement has long stood at the head of strong cements. Chas. Duisenberg & Co. are the agents on the Pacific Coast. SEE NEW ADVERTISEMENT.

Electric Gas Lighting—California Electrical Works—

Are prepared to furnish all work in their line. Burglar Alarms and Hotel Annunciators are among their specialties. SEE NEW ADVERTISEMENT.

Wire Work, Crestings, etc.—

The California Wire Works have extra facilities for the preparation of railings of wrought iron or wire, window guards, crestings, finials, etc. SEE NEW ADVERTISEMENT.

Window Shades—

W. McPhun, 1075 Market Street, furnishes houses or stores with the best of Window Shades. SEE NEW ADVERTISEMENT.

American Contractor—

Is published by B. Edwards at Chicago, Ill. A careful perusal of the advertisement will explain why every contractor should subscribe. SEE NEW ADVERTISEMENT.

Builders' Hardware—

The Pioneers—D. N. & C. A. Hawley—carry a full assortment of Builders' Hardware. SEE NEW ADVERTISEMENT.

Redwood Logging in California.

THE whole world concedes to America pre-eminence in the size of her trees available for timber. In no part of the world are trees to be found equaling in size the forest monarchs of California, save in certain parts of Australia and Tasmania, where the *Eucalyptus* trees grow perhaps to equal dimensions, but the wood of the Eucalyptus is gnarled and worthless, twisting and warping if used. California's big trees are of two varieties, the *Sequoia gigantea*, the most celebrated examples of which are found in the vicinity of the Yo Semite, and the *Sequoia sempervirens*, or redwood, which, though extending from the vicinity of Santa Barbara on the south, to Oregon on the north, are found in greatest size in Humboldt County. In the early English works on phytography, it was sought to link the name of their great Wellington to the trees of the Yo Semite, but now it is agreed that to the father of the American nation this honor appropriately belongs, and the name of *Washingtonia gigantea* is now coming into favor in popular and in scientific usage.

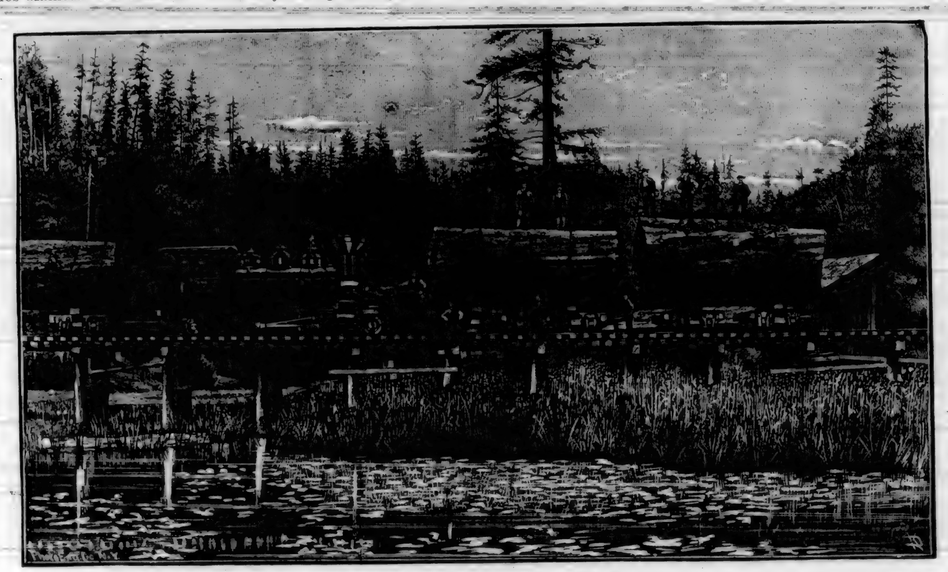
In the forests of Norway, Sweden, and Finland, the great timber-producing countries of Northern Europe, the standard width of boards is six inches, and trees larger than eight to ten inches diameter are unusual. Several years ago a large American locomotive establishment shipped a cargo of locomotives to H n lo. the terminus of one of the Finnish railways. They w re pa ked in boxes of Michigan two-inch pine plank, many of them fifteen to eighteen or more inches in width. Boards of this extraordinary width attracted much attention, and an employe of the railway obtained sufficient of the empty boxes and fashioned them into a house—the best in the place—and people came in considerable numbers to marvel at trees which could produce boards like those. The thrifty house-wives greatly prized pieces of the same boards for making moulding boards, and many were distributed for this purpose. If our ordinary lumber of commerce could excite such surprise, how much greater the astonishment and admiration of the same people at California's wonders! An American gentleman was once waiting at a Russian custom house to have his effects examined and passed. As he opened his trunk a photograph of one of the great trees was lying on top, exposed to view. The inspector examined it eagerly. "Ah," said he, "that is from California. I have a brother there who has written us at home much about them, but we could not credit it. I have never seen a photograph of them.

The picture was presented to him, whereupon work was suspended until it had been handed about and discussed by all, up to the chief of the custom house. The photograph showed a great tree partially cut for felling, with twelve persons sitting uncrowded in the V-shaped cutting. This calls to mind a *bon mot* of the late George Whitney, of Philadelphia, who, on seeing the same photograph, exclaimed, "Why, it is a photograph, but it really looks like a wood-cut!"

A peculiarity of the redwood forests is the absence of undergrowth. It is, therefore, difficult to realize their magnitude without a familiar object near by with which to compare them, until one begins to make such a comparison the trees do not appear of extraordinary size. Like the cataract of Niagara, the first view is frequently disappointing, and familiarity, far from breeding contempt, serves to increase the feeling of awe inspired by overpowering magnitude.

In consequence of the great size of the redwood the process of getting the logs to the mills has been a slow and expensive one. Floating has been impracticable, owing both to the size and the weight of the logs, even where there are streams; hence logging railroads are in California a necessity instead of an economic convenience, as in the pine forests east of the mountains. In some cases long lines of oxen laboriously drag the logs through the woods, and in other cases, tackling, operated by cattle or mule power, or sometimes by donkey engines is employed to load the logs. But those methods are too slow, and are being superseded by steam power conveniently applied.

The necessity for some special means of handling these great logs led Mr. John Dolbeer, a large lumber operator of San Francisco, to think of attaching a steam windlass to an ordinary locomotive. A patent was granted him for a device by which the steam windlass could be thrown into gear with the driving wheels of the locomotive for the purpose of propelling it, or could be used separately for its legitimate work of lifting and handling logs. Since then the Baldwin Locomotive Works, of Philadelphia, have built, for logging railroads on the Pacific Coast and elsewhere, a special type of double end logging locomotives, equally adapted for running in either direction, and equipped with a powerful steam windlass at the forward end. Unlike Dolbeer's locomotive, however, the windlass is entirely disconnected from the driving gear of the locomotive, and the locomotive can be built either with or without it. The locomotives referred to have two pairs of driving-wheels coupled and a two-wheeled or pony truck at each end. A saddle tank carries the water and the rear truck carries a large wood-box. The forward truck is center bearing, the rear truck side bearing. The wheel base is extended sufficiently to distribute the weight of the engine over a good length of track, while at the same time it is perfectly flexible, allowing the locomotive to run on the roughest track and pass the shortest curves with ease and without injury to itself or the track. A powerful steam-break acting on both pairs of driving-wheels controls the motion of the engine on steep grades and serves to lock it firmly while the windlass is in operation. The windlass is a Copeland & Bacon six-inch double cylinder, with single or double gearing as the weight of the logs to be handled requires.



Transporting Redwood Logs By Rail.

The two accompanying engravings show the method of handling the great redwood logs of Humboldt County, California, by the Albion Mill Company. The first engraving shown herewith is from a photograph of a logging train, only part of which, however, is shown. The locomotive is of the type referred to above. The largest log shown is twelve feet in diameter. The second engraving shows the operation of unloading one of the large logs with the steam windlass, the log shown being so large as to require splitting before going to the saw-mill. Some of this green redwood timber is very heavy and will sink when put into water. The logs handled frequently weigh twenty to thirty tons.

Redwood is the common lumber of the Pacific Coast, taking the place of the pine and hemlock of the Eastern States and the deals of England. It is used for clapboards, siding, shingles, in fact for every purpose where it is not subject to wear. When dried it is quite soft and wears rapidly by attrition; it is, therefore, unsuitable for flooring or stair purposes. It is used to some extent for railroad ties, though not so well adapted to this service as harder woods. Particularly on curves the spikes become loosened by the lateral pressure against the rails. Redwood is remarkable in that its shrinkage is mainly in the direction of its length. Though its grain is usually straight, it can be found with grain curled, bird's-eye, and other fantastic shapes, rivaling in this respect the most beautiful bird's-eye and curly maple. Its rich color, much resembling red cedar, its beautiful grain when carefully selected, and its great durability when not subject to wear, make it most desirable for interior decoration. With the low transcontinental freight now ruling, and likely to continue, it must become recognized in the Eastern States as a wood rich in economic and ornamental possibilities.—*N. W. Lumberman.*

Unloading Redwood Logs By Windlass.

Kitchen Scrubbing.

OLD flannel of all kinds should be kept for scrubbing and cleaning paint—undervests, drawers, skirts, all come in for it. In England where scrubbing is still the glory of the poorer people, cottagers vying with each other on the color of their boards, there is a coarse, gray flannel made, called "house-flannel," expressly for the purpose. Next to flannel, is old, coarse, soft linen, old kitchen towels, crash, etc. So necessary to good cleaning is soft, absorbent material that I would almost rather my maids destroy articles of far more value than the scrub cloths, because the supply is so limited, especially if we give away our disused underclothing. For this reason keep the supply under your own care; see that after each using the cloth is dried and not thrown away until it is really used as long as possible. Many girls will be conscientious about towels and dusters because they have a money value, but cleaning cloths, being only rags, they will consider may be thrown aside any time and fresh ones taken.

In addition to the soft, wet cloth, a dry rubber (best made of old Russian crash that has done service for round or dish towel) should be kept. A scrubbing brush of hard bristles is best; the soft excelsior brushes are of little use except for coarse paint, and brushes made of broom straw, although not entirely satisfactory, are about the best one can get when bristle brushes are not to be had, or are too expensive.

Tables that have been neglected may be bleached by spreading on them overnight a layer of wood ashes, made into a mortar-like paste, with water; the next day brush it off and scrub. The same paste may be laid on floors when spotted with grease.

In cleaning floors never wet too large a space at once. If beyond the comfortable range of the arm, there is almost certain to be a dark circle when dry, showing where you leave off each piece; because, being out of easy reach, you have no power to scrub well or wipe dry. Always in using the drying cloth, rub it well beyond the space you are now cleaning over to the one last done.

The use of a little washing soda or borax in the water is excellent for boards, and if they have been neglected, a small lump of lime in the water greatly helps to make them white. After tables are scrubbed attend to the sink, put a lump of washing soda, as large as an egg, at least, over the sink hole and pour a kettle of boiling water over every part of it, using your sink brush to send it into all greasy parts.

Wash, the last thing before the floor, all finger marks from the paint; also the chairs, if painted; the backs of them, if caned; the top of the flour barrel, and the windows. Be especially careful to clean kitchen window sills; so many things are put on them, they are more apt to be soiled than any others. Needless to say that floors must always be swept before they are washed.

To clean oil-cloth, do not scrub it unless it has been badly cleaned many times, when, with the fine corrugated surface now usual, dirt, or rather the dirty water allowed to remain in it, will have grimed it so that you will need to use a soft brush and scrub the way of the lines; but usually warm water, one wet and one dry cloth are all that are needed. Oil-cloth and paint need the wiping with a coarse, dry cloth as much as boards, and well repay the extra trouble. Skim milk used in place of water to clean oil-cloth gives it brightness and luster. Painted floors must be treated just as oil-cloth is.

I have one thing more to say about the kitchen sink. If you put in it a lump of soda weighing a half pound or more every day or two, you will have no trouble with the drain-pipe becoming clogged with grease. So large a piece will dissolve very slowly, but all the water that goes down will help to cleanse instead of soil the pipe. Whenever you have a kettle of boiling water that you do not need at once, pour it into the sink.

Graining.

OAK.

THERE are few graining colors that look better than oak as applied to wainscoting and to the doors of halls, as well as the woodwork of landings. We have seen oak graining on pine that was hardly distinguishable from the finest natural wood, with its medullary rays, curly knots and veinings. Dark oak is well adapted for the wainscots of staircases having abundant light, while the light descriptions suit darker and smaller staircases. Oak graining looks particularly well where common wood is employed, and care in reproducing natural markings and veinings will be well employed. Good specimens of natural wood should always be alongside of the painter.

For light oak graining the following may be recommended as a ground: White lead in equal quantities of raw linseed oil and turpentine, with a half pound of dryers to each seven pounds of lead, and with sufficient Oxford ochre to make a light tint. For darker wainscot an additional amount of ochre must be intermixed. The color should be well strained and finished off with fine sand-paper.

A quarter of a pound of burnt umber, ground in linseed oil and well thinned with an extremely limited quantity of dryers, and a small quantity of raw sienna, ground in linseed oil, and which is added for purposes of enrichment, constitutes a good graining color for doors, as well as wainscots and other woodwork in halls, staircases, and landings. It is to be laid on evenly and thinly.

The over-graining color for general use in oak is made up of Vandyke brown, ground in water. The exposed streaks and curves caused by the comb and veining horn on the dark graining color are the lights, and the graining color the shades. The ground is to be shown up so as to match the medullary rays of the natural wood. All harsh, hard lines are to be avoided. When they appear at once soften them down. Mottled appearances, so charming when well done, come in on over-graining, for which Vandyke brown, ground in water, is usually employed. The over-graining need not follow closely the natural markings of the wood, room being afforded for the fancy of the painter. To give the appearance of the panels and rails of a door being framed with oak of a darker hue fewer lights should appear on the styles. The lights across the grain in the work of oak graining are well set off by an occasional wavy or zigzag light across the grain. Panels serve well to display curly knots skillfully distributed.

Pollard oak graining requires considerable skill. The ground is to be prepared with color in oils, as for wainscot oak, using yellow ochre, or Venetian red and yellow ochre, or orange chrome as the coloring matter, according to the depth of tone required in the graining, which is so largely influenced by the tone of the ground. When dry, this is to be sponged over with whiting and water. The surface of the graining color may be made up of Vandyke brown and water for indoor work, laid evenly with a brush and worked level with a hog mottler. The brush having been dipped in the deepest and darkest of the graining color, dabs of this are made where the panels are to be located. These are dabbed over with a coarse sponge, and next the dabs are drawn into groups by sundry curls of dark tints. Smaller curls and fine lines are put in with a sable pencil. The over-graining color, put on when the former coat is dry, is made up of the same pigment ground in beer, but thinner. It is applied with an overgrainer. The tints are then softened with a badger softener, the colors being drawn toward the group of knots, lights being taken out where needed and harsh lines softened by drawing the softener across them in every direction. When the over-graining is dry it should receive two coats of oak varnish.

SATINWOOD.

The ground to be used for satinwood graining is made up of a white lead, oil color, just tinted with chrome yellow, raw sienna, or yellow ochre. The work is to be cissed in with whiting and beer. The graining colors may be either middle chrome and deep black, or Vandyke brown or York brown mixed with beer and rubbed in smooth and even with a tool and hog's-hair mottler. Next a coarse sponge is moistened in beer and drawn down over the work so as to leave the liquid to run in rather broad streaks in a slightly wavy or oblique direction. The whole is softened with badger softener. With a clean, moist camel's-hair mottler the grainer proceeds to work down the edges of the streaks with a jerking movement, so as to impart that varied and fanciful appearance so much admired on the natural wood. The over-graining color is composed of Vandyke, York brown and black mixed with beer, but in different quantities than those used in the graining color, for the purpose of making different tints and shades. First put in the heart with a small sable pencil, brush this lightly with the badger softener and finish the rest of the over-graining with a sable tube over-grainer, the hairs of which have been separated with a comb. The work, when dry, is to be varnished with two coats of the best pale oak varnish.

MAHOGANY.

The ground lead for mahogany is white lead, oil color, tinted with Venetian red and yellow ochre, or chrome ochre may be substituted for yellow ochre where a deeper tone is desired. The various tones of color are obtained by useing more or less of the pigments. When the ground color is dry it is to be cissed with whiting and beer. The ground color is made up of Vandyke brown, or this color and black or burnt sienna and black, or burnt sienna and Vandyke brown to suit the ground and desired effect. The pigments mixed with black are to be rubbed in dark, then the work is gone over with a moist camel's-hair mottler, producing the peculiar curly and feathery grain of mahogany, and shading off as it goes from mid-feather to paler points and sides. The mid-feather is produced by gathering in the grain from the sides and working it along toward the point. The over-ground color is made up of Vandyke brown, with a little crimson lake when a brighter hue is desired. This color is to be mixed with beer and applied with a hog's-hair or sable grainer. The over-grainer must be made to follow the direction of the feathers and curls. Rising from their center and becoming gradually more prominent, the forms are gradually lost in the general matter of the surface. If the wood is too light in color, or not sufficiently rich in hue, it may be varnished or treated to a megilp of boiled oil and turpentine, and when this is dry, the surface may be again treated to an over-graining, with a mixture of brown lake and black or burnt sienna, or Vandyke brown and crimson lake. This may be continued until the real tint is obtained, then the whole must be nicely stippled with a softener and allowed to dry a whole day. The surface may then be varnished.—*Painters' Magazine.*

Hints on the Care of Tools.

THE following hints on the best means of keeping tools in good condition cannot fail to be useful:—

Wooden Parts.—The wooden parts of tools, such as the stocks of planes and handles of chisels, are often made to have a fine appearance by French polishing; but this adds nothing to their durability. A much better plan is to let them soak in linseed oil for a week, and rub them with a cloth for a few minutes every day for a week or two. This produces a beautiful surface, and at the same time exerts a solidifying and preservative action on the wood.

Iron Parts.—Rust preventives.—The following recipes are recommended for preventing rust on iron and steel surfaces:—

1. All steel articles can be perfectly preserved from rust by putting a lump of freshly-burnt lime in the drawer or case in which they are kept. If the things are to be moved (as a gun in its case, for instance), put the lime in a muslin bag. This is especially valuable for specimens of iron when fractured, for in a moderately dry place the lime will not want renewing for many years, as it is capable of absorbing a large quantity of moisture. Articles in use should be placed in a box nearly filled with thoroughly pulverized slaked-lime. Before using them rub well with a woolen cloth.

2. To keep tools from rusting, take one-half ounce camphor, dissolve in one pound melted lard; take off the skum, and mix in as much fine black-lead (graphite) as will give it an iron color. Clean the tools and smear with the mixture. After twenty-four hours, rub clean with a soft linen cloth. The tools will keep clean for months under ordinary circumstances.

Strength of Brick Walls.—For first-class buildings with good workmanship, the general average should not exceed a greater number of feet in height than three times its thickness of wall in inches, and the length not to exceed double the height, without lateral supports of walls, buttresses, etc., as follows for safety:—

Thickness.	Safe Height.	Length.
8½ inch walls.	22 feet.	50 feet.
13 "	40 "	80 "
17 "	55 "	110 "
22 "	66 "	130 "
26 "	78 "	150 "

Where the lengths must exceed these proportions, as in depots, warehouses, etc., the thickness should be increased or lateral braces instituted as frequently as practicable.

The above is a plan for a country home, especially designed for a farmer, the total cost of which will not exceed $5,000. It is suitable for a lot on a hill-side, and makes a convenient and handsome dwelling. The foundation is of brick, stepping off to suit the grade of lot. The basement contains the kitchen, servants' rooms and store rooms, and also a large veranda off the rear. The first story contains parlor, dining-room, library, and large main hall. After entering the front door, you find yourself in a large hall, on one side the commodious stairs and colored glass windows, on the other side, double doors connecting the parlor with the main hall, also single doors to the basement and library. The parlor is lighted by a large square bay window, with large panes of twenty-six ounce glass below, with smaller lights above, as shown. Off the parlor is the dining-room, connected with sliding doors. The dining-room is also connected with the rear porch by a large twenty-six ounce glass boxhead window. In one corner of the dining-room there is a dumb waiter.

The second story, which is reached by an easy and commodious staircase, with three landings, and placed near the center of the building, so as to afford ready communication to the several chambers, contains four chambers and also a good-sized bath-room. Off the front chamber, over the bay window, is a balcony, from which a view of the surrounding country may be had. The roof is of redwood shingles, painted two coats and the side walls are shingled with fancy octagon shingles where shown.

ASKED, ANSWERED, AND COMMUNICATED

☞ Architects, Contractors, Carpenters and Mechanics generally are respectfully requested to furnish us items of interest for this column. We will gladly answer any and all questions pertaining to the architectural and building interests. If illustrations are necessary to explain your ideas, send us a sketch of them and we will make the cuts.

Free to All.

The columns of this journal are open to all who differ with us upon any subject presented. We are too old in years and experience to assume that we have passed the reef of human liability to err, or for one moment to suppose that we have reached the realms of thought where perfection reigns supreme. But this we do assure—that whatever of error there may be contained in our columns will be speedily corrected, as soon as attention is directed thereto, and we are convinced of the error. We will give place to a reply in any case, when a mistake or wrong statement has occurred. It is our desire and purpose to be fair, just, and correct in all things, and do no person or subject any violence. We therefore invite free discussion and criticism, and again state that the columns of this journal are at the service of all who desire to differ with us upon any theory or subject, or who take exception to anything at any time appearing in our columns.

We intend to make a specialty of this department of our journal, and, in order to make it thoroughly interesting, we desire the co-operation of all architects, mechanics, etc., whether subscribers or not. In this column there is a great opportunity for comparison of ideas on the practical questions of the day; and we hope to receive from those interested, and especially amongst builders, questions arising in their daily practice. No matter what may be the solutions given to the various problems presented, we shall only be too pleased to receive replies from our readers, where they see other and better solutions for them. If a general interchange of ideas can be brought about great advantages will ensue to all. Let not a month go by without bringing up for discussion practical topics in the architectural, mechanical, or scientifical pursuits. We desire a general expression of opinions, for or against, of every article presented by us. Every communication will receive deliberate and careful consideration.

Working Drawings.—Will you inform me what is the exact meaning of the term, "working drawings." I notice that architects often add to their specifications that working drawings will be supplied where required. Are not plans, elevations, and sections, enough for working purposes? Boss Carpenter.

Yonkers, N. Y.

Answer.—The term "working drawings" is generally understood to mean detail and other drawings worked out to a sufficiently large scale to show every detail of the construction, often being full size. Ordinary plans and elevations are not drawn to a scale large enough to work from, excepting to set out the main dimensions, so that where any peculiar or unusual construction is to be used, detail or working drawings are supplied by the architect, and the contractor has therefore no excuse for bad construction.

A new method of securing veneer to its base consists in spreading glue or other adhesive matter between the veneer and the base, passing the two secured parts under a heated roller to melt the glue and cause it to enter the pores of the wood, then finally passing the connected base and the veneer under chilled rollers to harden and set the glue, and prevent the warping or shrinking of the veneer consequent upon the gradual cooling or drying of the glue.

The word "striping," as formerly used in England, referred solely to a style of painting in which the panels of bodies were painted in alternate stripes of light and dark color, as light and dark brown, blue, green, etc. The stripes were three-quarters or an inch wide.

How foolish it is for a man who has labored all his life at some mechanical trade, and attained wealth and all the comforts that money can purchase to surround himself with, to suddenly conceive the idea that it is not genteel to be a mechanic, abandon his trade or sell it out, thinking to elevate himself in the estimation of his fellow-men by wearing fine clothes and putting on aristocratic airs that are unnatural to him. Such men may be flattered to their face, but behind their backs they are invariably spoken of with contempt. I admire the old English style. If a man there is a successful manufacturer or mechanic, no matter how wealthy he becomes, his sons and grandsons are not ashamed to be known as mechanics themselves, but write themselves with pride as successors to the old firm. For honesty, integrity, and genuine respectability, commend me to the intelligent, hard-working mechanic!

Natural Position of Wood.

The problem, says a scientific writer, has interested many, why two pieces of wood, sawn from the same section of tree, should possess very varied characteristics when used in different positions, as, for example, a gate post being found to decay much faster if the butt end of the tree is uppermost than would be the case if the top were placed in this position, the reason being that the moisture of the atmosphere will permeate the pores of the wood much more rapidly the way the tree grew than it would in the opposite direction. Microscopical examination proves that the pores invite the ascent of the moisture, while they repel its descent. The familiar case of a wooden bucket is in point—that is, some of the staves appear to be entirely saturated, while others are apparently quite dry. This also arises from the same cause, viz., the dry staves are in the position in which the tree grew, while the saturated ones are reversed.

Redwood Logging in California.

This article and the cuts illustrating the same were kindly furnished us by the *Northwestern Lumberman*, of Chicago, one of the leading papers of its class in the world.

Advertisements that Have Appeared In Every Issue of This Journal since Its Inception in Jan., 1879.

The Right to Reject Bids.

AMERICAN ARCHITECT.

A private corporation advertise for bids on an important structure in the usual form, "reserving the right to reject any and all bids." The sealed bids are opened in private by the company's officers, the terms of the bids are not made public, and the contract awarded to one of the bidders, who agrees with the company not to allow the amount of his bid to be known. What are the rights of bidders under such circumstances, and what remedy, if any, has the lowest bidder among those shut out, granting him to be solvent and capable, and his proposed bondsmen above criticism? Very respectfully,

A Contractor.

The bidders have no claim to know the amount of the accepted tender, if the parties immediately interested wish to keep it to themselves, nor has the lowest, or any other bidder, under the conditions of the bidding, a right to insist upon the acceptance of his offer. The reservation made in the advertisement that the company should have the right to reject any and all bids makes this clear, but even where no stipulation of this kind is made, it has been repeatedly decided that the party inviting bids has a right to consider other circumstances besides the relative amount of the tenders, and to accept the one which seems, on the whole, most advantageous for him.

CALIFORNIA WOODS.

AN ABUNDANCE OF LUMBER FOR BUILDING.

THE BIG SEQUOIA VARIETIES.

Monster Trees—Durability of Redwood—Scarcity of Useful Hard Woods—Eucalypti.

Much of the value of a country as a place for homes depends upon the quality and quantity of the native timbers. It is true that the timber may be in such excessive quantity as seriously to retard the development of a country. The settlers of the Atlantic Coast had a fearful contest with the solid belt of timber, six or eight hundred miles wide, which met them, like *chevaux de frieze*, at every point. There were no open glades ready for the plow, no parks with stately trees so far apart that grass grew as high as a man's head, as in California. When the immigration reached the open prairies, a few miles across, inviting the plowman to immediate work, the settlers' joy was unbounded.

A Scarcity of Timber.

But as they went farther west, the open glades became larger; the timber thinned out until the groves became a day's ride apart, and finally ceased altogether. It was too much of a good thing. Even in Kansas, the settlers who were in advance of railroads had to dig holes in the hill-sides for dwellings; hence the significant and ominous name for a home—"dugout." There was no timber for fuel. Cornstalks, and even the corn itself, were used to warm the houses. The writer well recollects cooking a scanty breakfast with cornstalks for fuel, while crossing the *wilds* of Iowa on the way to California in 1850.

During the past winter the thermometer went fifty degrees below zero in Dakota and Montana, and no timber within hundreds of miles. The building of homes in such a country, however fertile the soil, must be attended with serious difficulties, especially in a land of blizzards. No wonder people freeze to death in their beds.

California Well Supplied.

All of California north of the thirty-sixth parallel is well timbered, or within easy reach of lumber. The Sierra Nevadas from the base to the summit furnish the finest pine timber to be found in the world. The sugar pine is without a peer. It rises in a straight, tapering shaft, symmetrical as a column of the Parthenon, a hundred feet, without a knot or limb. A large variety of other pines, firs, and spruces of immense size affords and inexhaustible supply of lumber for all domestic uses. At the base of the Sierras the pine gradually gives way to a great variety of oaks, including the evergreen live-oak. These do not grow in a dense wood as in the Eastern States, but in the shape of a well-cared-for park. The greater portion of it is so open that carriages may be driven anywhere. This oak timber is brittle, inelastic, and of little economic value except for wood. Scattered over the alluvial plains, it adds much to the general beauty of the country.

The Redwoods.

The Coast Range of mountains has its valuable timbers as well as the Sierra Nevadas, though the varieties are entirely different. The pine is represented by but one or two useless varieties, giving place to the *Sequoia Sempervirens*, a close relative of the *Sequoia Gigantea*, or Big Tree family, found only in a few groves along the Sierras and said to be the largest trees in the world, some of them measuring thirty feet and upwards in diameter, and three to four hundred feet in height. Though not so large as the *Sequoia Gigantea*, the coast *Sequoia* is an enormous tree. The first Americans thought they were monsters. Compared to the trees of the older States they were. One man built a house and fenced in forty acres of land with a five-rail fence, all from one tree. Two hundred thousand shingles from a

single tree were not unusual. Some of the trees were fourteen feet in diameter, sound to the center, and a hundred feet to the firs' limbs. The lower part of the trunk, for ten or fifteen feet, usually settles upon itself, forming a curly grain, now much prized for finishing lumber, but formerly considered worthless. A high scaffold was built to cut the tree off above this swell.

COULD NOT BE HANDLED.

When the trees were felled they had to be blasted to pieces before they could be sawed. No saws were long enough; in fact, the logs could not be moved with any means at the command of the millmen. Then of what use was a twelve foot-wide plank except as a sample production of California?

The redwood, as the first settlers called this tree, from the reddish tint of the wood, is of free grain. It is not unusual to see split siding for a house, twelve feet long and a foot wide. It readily splits into posts, rails, pickets, stakes for grapes or any other purpose. It is inferior in strength to the pine, fir, or any of the soft woods, but has numerous oth r qualities which make it valuable. It is a common saying that it never rots. A post form ng the cross at the Santa Clara Mission, set in the ground seventy years ago, was perfectly sound when it was taken out, though the wind and weather had worn it nearly off above the ground. Fences built of it in 1850 are as sound as on the day they were erected. Houses will last generations, as far as decay is concerned. Being destitute of resinous matter, like that which prevails in the pine family, the redwood is not as inflammable. A house burns slowly, affording time for fire companies to get engines to work. The buildings in San Francisco are to a great extent constructed of redwood, to which fact San Francisco owes much of its exemption from devastating fires.

OTHER TIMBER.

The Coast Range abounds with numerous other valuable varieties of timber, such as the fir, spruce, cypress, madrone, etc. Excepting the last, they are all soft woods, relatives of trees of the same name in the East. They make good flooring and dimension timbers, being stiff and strong, but are not used to any extent for finishing lumber.

The madrone is a slow-growing evergreen, with irregular trunk and spreading top. The wood has about the texture of the sugar maple, is of a dark, rich color, and takes a fine finish. It is coming into use for furniture and fine finishing. The laurel, or pepper tree, is also a hard, elegant wood with about the same uses.

The reader will observe a scarcity of timber suitable for wagons and machinery. The want of it is seriously felt. The Puget Sound firs are strong enough for car building, also for some agriculture machinery, but nowhere is there anything equal to the oak or hickory of the Eastern States. At present all are imported. Even the oak staves for wine casks are brought over the Rocky Mountains.

THE EUCALYPTI.

Our only hope is in growing imported varieties. The locust flourishes well, as do varieties of the walnut and hickory, but our main reliance for hard wood timber is on the eucalypti, a family of about fifty varieties, some of which are equal to any of the Eastern hard woods. The *Eucalyptus Globulus* (blue gum) promises to be eminently useful. It is a rapid grower, adding two inches to its diameter and several feet in height each season. Some of the trees planted as ornamental trees twenty-five years ago are now four feet in diameter, with three good saw log cuts on the trunks. The wood is hard, tough, fine-grained, and said to be the strongest timber of its weight known; but as its grain interlaces, preventing its being split into rails or shingles, it is rather unpopular. They are not suitable for ornamental trees Being such vigorous growers, they are of necessity gross feeders, absorbing all plant food within fifty or sixty feet but are excellent forest trees. The tall, plume-like trees, a hundred feet or more high, have become quite a feature in the landscapes of San Jose. Nothing can be more stately than a eucalyptus grove fifteen or twenty years old. Every farmer with twenty acres of land should give one acre to a grove of these trees. It will insure him wood for the next hundred years.

IT seems to be conceded by good authority that elasticity is a property of young wood, and the greater the exposure the greater the elasticity.

CONTRACTORS, ATTENTION!

For $5.00 we will insert your business card for one year, and send you this Journal, free.

BUILDING PROPOSALS.

Plans and specifications for the building of the University of Arizona will be received at the office of the Board of Regents, at Tucson, A. T., until Monday, May 2, at 10 A. M.

The design for the buildings must comprise within its scope, plans and specifications to include (under the law) accommodations for the following departments:

1. The department of science, literature and the arts.
2. The department of theory and practice and elementary instruction.
3. The department of agriculture.
4. The normal department.
5. The department of mineralogy and school of mines.

The Regents desire plans and specifications, which will provide for all these departments, and which will constitute a complete university, modeled upon the most approved methods, comprising in architectural design all the latest improvements in mechanical skill that will add to the comfort and convenience of pupils and the advantage for proper training.

It is the intention of the Board of Regents to inaugurate this enterprise by the erection of a single building or portion of a building at present, as the funds now on hand are only sufficient for that purpose. They desire that this first building shall serve as a model for all the others to be erected.

It is the intention to devote the funds now on hand for the establishment of a school of mines and when the plans and specifications have all been received and a selection made, it will then be determined which of the buildings included in said plans and specifications will be the most suitable for the department of mineralogy and school of mines, and the work of constructing this building will then begin.

All the buildings are to be of stone or brick, and to be built upon a plan most suitable for this climate, and with a view to their substantial and permanent character. The Regents desire to call special attention of architects to the necessity of providing means for the greatest shade around the buildings to protect the occupants from the great heat and light consequent upon the hot, dry summers of Arizona. They should be erected upon a plan which will admit of their future enlargement without destroying their architectural beauty and design.

The amount to be used for the building now under consideration cannot exceed the sum of twenty thousand dollars ($20,000).

The amount of $500 will be paid for the design accepted by the Board, reserving to itself the right to reject any or all plans and specifications submitted.

CHARLES M. STRAUSS,
Secretary.

IMITATING ROSEWOOD.—Various methods have been devised for treating the surface of certain woods so as to produce imitations of choicer varieties. Some of the most attractive work in this line, however, is made by simply spreading on the surface of the material a concentrated solution of hypermanganate of potassa, this being allowed to act until the desirable shade is obtained. Five minutes suffice ordinarily to give a deep color, a few trials indicating the proper proportions. The hypermanganate of potassa decomposed by the vegetable fiber with the precipitation of brown peroxide of manganese, which the influence of the potassa at the same time sets free, fixes in a durable manner on the fibers. When the action is terminated, the wood is carefully washed with water, dried, and then oiled and polished in the usual manner. The effect produced by this process in several woods is remarkable. On the cherry, especially, it produces a beautiful red color which resists well the action of air and light, and on other woods it has a very pleasing and natural effect.

QUARTER-SAWED lumber has become so popular with customers throughout the country that a great many mills are devoting considerable attention to that class of work.

A List of Mechanical and Architectural Works

DEDUCT

ONE-SEVENTH FROM PUBLISHED PRICE.

The amounts given below are the Publishers' Cash Prices. We intend to reduce our stock, at present the largest of its kind in California, and therefore make the accompanying liberal offer.

Select any work from the list, deduct one-seventh of the price given, forward us the money, and by return mail you will receive the book or books selected, with charges prepaid.

Alameda.

REAL ESTATE AND IMPROVEMENTS.

The construction of a five-room cottage for Mr. Godfrey has been commenced on St. Charles Street, near Railroad Avenue.

A small cottage is being built on Taylor Avenue, near Prospect Street.

The construction of a six-room cottage for Col. J. W. Hawkins was commenced last week, on San Jose Avenue, near Walnut Street.

Mrs. A. Painter will build a six-room cottage on Regent Street, near San Jose Avenue, work to be commenced on the building this week.

Peder Hundrup is building a four-room cottage on the corner of Everett Street and Blanding Avenue.

A seven-room residence, to cost about $3,500, is being built for Mr. Lainer, on Kings Avenue, west of St. Charles Street.

An addition has been added to the rear of the skating rink building, on Lincoln Avenue. The two stores in the building will be converted into a laundry.

N. K. Holinquist is about building two cottages on Second Street.

A two-story brick building will soon be erected by Mrs. Nellie Liese, on Park Street.

The following parties are all contemplating building in the near future: John Gale, R. Harvey, P. A. Markson, Mrs. M. L. Troost, John Anderson, F. Foote, C. Radgwill, and many others.

Astoria.

The Truckee Lumber Company will soon erect a large saw-mill near this place.

Lumberman's Hand-Book, for $2.00.
Practical Geometry, for $1.00.

Auburn.

J. J. Smith is erecting a cozy cottage.

Byron Springs.

L. R. Mead intends to enlarge the hotel at this place.

Ruskin's Works (four volumes), for $6.00.
Industrial Drawing for Carpenters, for $2.00.

East Oakland.

Fifth Avenue and Tenth Street. Repairs. Owner, C. Kirk; architects, J. J. & T. D. Newsom. Day work. Cost, $1,500.

Fresno.

W. H. McKenzie will erect a handsome dwelling.

Builders' Companion, for $1.50.
Builders' Work, for $5.00.

Geo. W. Meade will soon commence the erection of a building 150x250 feet, two stories high.

Every Man His Own Mechanic, for $3.50.
Tredgold's Carpentry, for $7.50.

G. L. Bradley will erect a large brick building.

American House Carpenter, for $5.00.
Cutting Tools, for $2.00.

J. W. Ferguson will begin the erection of a two-story brick building in the course of a month.

Building Superintendence, for $3.00.
American Cottage Homes, for $3.00.

It is proposed to erect a $25,000 brick building for school purposes.

Science of Carpentry, for $4.00.
Universal Assistant, for $2.50.

A new Presbyterian church will shortly be erected at this place.

Plaster, How to Make It, for $1.00.
Shavings and Sawdust, for $1.50.

Gilroy.

George E. Hersey is making extensive improvements to his property; J. Lenzen & Son being the architects.

Healdsburg.

The Episcopalians are preparing to build a new church.

Los Angeles.

R. Dunnigan is preparing to erect a three-story brick building on Buena Vista Street, near Bellerue Avenue.

Napa.

W. A. Brown is about to build a one-story frame, at a cost of $2,000. J. Marquis is the architect.

Oakland.

Chas. Mau is building a house on Filbert, near Fourteenth. Cost, $4,000. Day work.

Builders' Companion, for $1.50.
Builders' Work, for $5.00.

Brush, between Twenty-second and Twenty-third, Oakland. Owner, John Winter. Contractor, Toohig & Moore. Architect, Chas. Mau. Cost, $3,773 (except sewer and mantels).

Brick building. Owners, A. J. Snyder and J. Woener. Contractor, brick work, Remillard. Carpenter, W. Winnie and R. Murray. Architect, Chas. Mau. Cost, $9,000.

Lumberman's Hand-Book, for $2.00.
Practical Geometry, for $2.00.

Pacific Grove.

The new hotel building at this place will be in size 100 x 142 feet, three stories in height. Work was begun on the foundations the latter part of February.

Ruskin's Works (four volumes), for $6.00.
Industrial Drawing for Carpenters, for $2.00.

Portland, Or.

Dr. Glisan is to erect three residences on Eleventh and B Streets.

Artistic Homes, for $3.50.
Modern House Painting, for $5.00.

Port Hadlock, W. T.

A large saw-mill is being erected at this place. Also a warehouse.

Steel Square Problems, for $1.00.
Work-Shop Companion, for 35c.

Redlands.

W. C. Butler is about to erect a $3,000 dwelling.

Plaster, How to Make It, for $1.00.
Shavings and Sawdust, for $1.50.

Messrs. Owen & F. S. Hale will also soon build commodious dwellings.

Architecture and Building, for $3.50.
American Cottage Building, for $3.50.

Riverside.

Over $5,000 has already been subscribed towards a new church for the use of the Episcopalians.

Mural Painting (new), for $3.00.
Home Hand-Book, for $10.00.

The Catholics are also preparing to erect a large church.

Practical Perspective, for $5.00.
Woodward's Country Homes, for $1.50.

Mr. Turner is putting up a two-story brick building.

Limes, Cements, and Mortars, for $4.00.
Wonders of Art, for $1.25.

Colburn & Myers are having erected a brick building.

Album of Mantels, for $8.00.
History of Architecture, for $15.

The contract has been let for a two-story brick building, 125 feet front.

EACH SUCCESSIVE NUMBER WILL BE COMPLETE IN ITS BUILDING REPORTS.

R. B. Taylor will soon commence the erection of a two-story brick building.

Artisan, for $5.00.
Builders' Guide, for $2.00.

Messrs. Rich, Woodall, Bohman, and others are all contemplating building.

Science of Carpentry, for $4.00.
Universal Assistant, for $2.50.

G. Lyon contemplates the addition of another story to his brick building.

Building Superintendence, for $3.00.
American Cottage Homes, for $3.00.

Sacramento.

Dr. G. L. Simmons is making extensive alterations to the brick building on J. Street near Second.

American House Carpenter, for $5.00.
Cutting Tools, for $2.00.

St. Helena.

J. C. Mixon has secured the contract for the erection of a house and barn for G. Stein.

Artistic Homes, for $3.50.
Modern House Painting, for $5.00.

San Jose.

Henry French is building a two-story brick house. Architects, J. Lenzen & Son; contractor, P. R. Wells. Cost, $8,500.

Practical Perspective, for $5.00.
Woodward's Country Homes, for $1.50.

Maurice O'Brien has let the contract for a one-story brick building to G. E. McDougall. Architects, J. Lenzen & Son. Cost, $4,000.

Hand Railing and Stair Casing, for $1.50.
Drawing for Carpenters, for $1.75.

J. H. Kohlhaner is building a one-story frame for P. Reen. J. Lenzen & Son, architects. Cost, $4,500.

Painter, Gilder, and Varnisher, for $1.50.
Architects' Companion, for $2.50.

George Hobson, owner; J. Lenzen, architect, J. Davis, contractor, for a $1,300 cottage, on Hobson Street.

Manual for Furniture Men, for $1.00.
Common-Sense Church Architecture, for $1.00.

C. Curdts is about to build a one-story frame. Owner, C. Oner; architects, J. Lenzen & Son. Cost, $2,000.

H. L. Hirsch is building a one-story cottage on corner of Orchard and San Carlos Streets; Theo. Lenzen being the architect; A. J. McIlwain the builder.

Artisan, for $5.00.
Builders' Guide, for $2.00.

On San Carlos Street, T. J. Gillespie is erecting a two-story cottage. Theo. Lenzen, architect. It is built by day's work.

Woodward's Farm Homes, for $1.00.
Woodward's Graperies, for $1.00.

R. Wiltz is having built a two-story dwelling with barn attached, at a cost of about $5,000. Theo. Lenzen, architect.

Building Superintendence, for $3.00.
American Cottage Homes, for $3.00.

U. Wood is erecting a large house on Second Street.

Grimshaw on Saws, for $4.00.
Mechanics' Geometry, for $4.00.

San Rafael.

The Tamalpais Hotel, lately partly burned, is being repaired at a cost of about $1,250. Huerne & Everett are the architects; F. Buckey doing the work.

Drawing for Stone Masons, for $1.50.
Building Construction, for $1.25.

Santa Cruz.

J. S. Green has contracted with Kaye, Knapp & Company to erect a two-story building on Beach Hill. Cost, $2,240.

Album of Mantels, for $8.00.
History of Architecture, for $15.00.

Santa Rosa.

J. Hall is erecting a two-story building near town.

Builders' Companion, for $1.50.
Builders' Work, for $5.00.

Allen & Bryant are erecting a building; Simpson & Roberts being the contractors.

Drawing for Bricklayers, for $1.50.
Drawing for Cabinet Makers, for $1.50.

Seattle.

Many new buildings are going up at this place.

Practical Perspective, for $5.00.
Woodwards' Country Homes, for $1.50.

Robert Abrams is preparing foundations for a large building.

Science of Carpentry, for $4.00.
Universal Assistant, for $2.50.

H. H. Lewis is contemplating the erection of a row of houses on corner of Third and James Streets.

Architecture and Building, $3.50.
American Cottage Building, for $3.50.

Kerns Brothers have secured the contract for grading, bridging, etc., for five miles of the Seattle, Lake Shore & Eastern Railroad.

Cutting Tools, for $1.50.
Cummings' Details, for $5.00.

SAN FRANCISCO, CAL., APRIL 15, 1887.

Fate of the Amended Lien Law.

IT has not received the approval of his excellency, Governor Bartlett, and is therefore dead. The fond hopes of thousands of mechanics and material men are again blighted, and the abominations of the present law perpetuated for a period of at least two years longer. The Governor may experience no compunctions of conscience at the great mistake he has made, being perhaps ignorant upon the many vital points and features involved in the law and its working, but if he could be induced to listen to the honest, heart-felt opinions and views as expressed by a congregation of ninety-five per cent of *all* those affected by his failure to do the right thing,—sign the amended bill,—*he* would be as regretful at his mistake as *are* the thousands who felt sure that the present legal monstrosity would have been virtually eliminated from the statute book by amendments possessing some reasonable degree of justice, equity, and fairness.

But the deed is done, and cannot be recalled, and the whole building fraternity, mechanics and material men alike, must settle down to a realization of the serious and grievous fact that for at least two years more the heavy and *hurtful* manacles of a bad lien law must be worn. It may be that his excellency had not the time to give the amendments due consideration; or, being unadvised, and not understanding the evils and hardships imposed by the present law, he failed to recognize the necessity for any amendments; or, not having studied the law as it is, he did not comprehend the fact that the present lien law of the State of California is one of the worst conglomerations of legal error and outrage to be found among the law books of the States of the Union combined.

We have not the slightest idea that the Governor was influenced to permit the amendments to go to their death for want of an executive prescription by any other motive than that of not time to consider, or ignorance of, or non interest in, the important measure before him.

Its pretenses to protection of rights are simply farcical, as back of these, and underlying the material features of the law, there are most serious and injurious provisions, which jeopardize tens of thousands of dollars to every one hundred protected. And the more serious feature of the case is that the greater hardships are imposed upon those the least prepared to endure them,—contractors and small contractors,—while in fact *not a single individual* is to any extent benefited or made more secure in his rights by reason of the tangled and unjust conglomeration of impractical notions, put together for *special* purposes, and by legislative enactment made a law of the State.

We are warranted in the assertion that the present law was "put through" without any investigation of its merits by the Legislature assembled. It was received from the committee to whom it was referred, and they being influenced and persuaded by those at the time favoring the *new experiments* contained in the law, reported favorably upon the amendments culminating in the passage of the law as it is, and the Legislature as a body accepted the recommendation of the committee, without questioning the wisdom or rightness of their recommendations, and made the thing recommended a law of the State.

Even those most earnest, and who made themselves personally interested in the passage of the law as it is, became, by the two last past years' experience, and the loud, long, and universal denunciations of those whose just rights and equities have been so materially compromised, convinced that amendment and change were necessary, and met in council with the representatives of the building interests, both material men and mechanics, and joined in perfecting and recommending the amendments which the executive has permitted to expire by limitation without his signature. Consequently, the Governor of the State, perhaps entirely innocently, has committed a great error, through which no rights or interests are secured or benefited, but severe inconvenience, financial risks, and many difficulties imposed upon every man engaged in the building business,—owners, material men, and builders, alike. A present discussion of the hardships and errors contained in the law as it is, and the interpretation given by the courts and legal fraternity, would serve no good purpose, as the demise of the amendments passed by the late legislative body, for want of the Governor's signature, ends all chance for relief until the next assembling of the law-making body, when, it is hoped, the many who are inconvenienced and hurt by the present law will take the matter in hand at an early stage of the Legislature, and see to it that wise amendments are substituted, by which all reasonable and right protections will be extended to all parties, and the onerous and unjust exactions of the present law removed.

The matter of the *dead letter* amendments was taken in hand at too late a day in the session, and fell through, not upon merit or demerit, but, being in the "last batch" of bills presented to the Governor for signature, shared a common fate,—failed for want of executive attention,—a small matter so far as those wholly disinterested are concerned, but a serious one to those who will be compelled to endure its provoking iniquities two years longer.

Building Record for April.

OUR report this month is very satisfactory for this season of the year. Prospects ahead are very encouraging. The only drawback to a successful building season, is the greed of the material men in raising the prices of their wares to the greatest limit to which the dear public's pocket can be strained.

During the month there has been commenced—

6 brick buildings, valued at		$173,500
77 frame "	"	431,850
17 alterations	"	31,450
100		$636,800

CONTRACTORS, ATTENTION!

For $5.00 we will insert your business card for one year, and send you this Journal, free.

DEATH OF LEVI GOODRICH,

Pioneer Architect of Santa Clara County.

ON Saturday evening, April 2, Levi Goodrich, a prominent member of the architectural profession on this coast, passed away to meet the great Architect of the universe above. Mr. Goodrich was one of the best-known citizens of Santa Clara County, and his death will not only be mourned in the garden city, but many other towns will sadly miss his genial face. Although a very large man, he has enjoyed comparatively robust health up to about one year ago. Steady application to a large business commenced to show its effects, and he was compelled to seek recreation. While visiting San Diego in a laudable effort to recruit his weary frame, he was overtaken by a stroke of apoplexy that caused his death in a short time. We are indebted to Bro. H. H. Main, of the San Jose *Herald*, for the following account of Mr. Goodrich's career:—

"Levi Goodrich was born in New York City on the first day of January, 1822. In his youth he acquired the trade of a carpenter and builder in Massachusetts, but subsequently went to New York and entered upon the study of architecture, which was also the profession of his father. He followed that pursuit in New York till 1849, when he sailed for California in the ship *Loochoo, via* Cape Horn, and arrived at San Francisco on September 16 of the same year. Immediately upon his arrival he began the practice of his profession. In fact, before he left the vessel he was called upon to draw plans and specifications for a three-story wooden building, which was erected on what is now the corner of Kearny and Washington Streets, where the old Hall of Records stands. On November 30, 1849, he came to this country in a small sailing craft to Alviso, the trip consuming three days and two nights. From Alviso he walked to this city. He soon began work, however, and there are in this and neighboring counties many monuments of his architectural skill. In 1850 he erected the adobe building which formerly stood on the site now occupied by the store of T. W. Hobson & Co., on West Santa Clara Street. From that time to within a year ago he has been engaged in business here. Among the principal buildings for which he prepared the plans are the Court House, county jail, the First Presbyterian church, three public schoolhouses, the Bank of San Jose, the old and the new State Normal School buildings, Knox Block, Martin's Block, the College of Notre Dame, the new buildings at the University of the Pacific, and many others. He was also the architect of the Court Houses and jails of Monterey and San Diego Counties. During the period of his residence here he twice visited Europe for pleasure and study. Several years ago deceased married Mrs. S. L. Knox. About a year ago he retired from business, being succeeded by his only son, E. B. Goodrich, and G. W. Page. Subsequently E. B. Goodrich left here for the East, where he now is.

"It is about a year ago that the health of Mr. Goodrich began to fail. His physician then reported that a blood-vessel in his brain had probably burst. Since that time his condition has been watched by his family and friends with apprehension."

Mr. Goodrich was a prominent member of San Francisco Chapter, American Institute of Architects, and a most hearty supporter of the CALIFORNIA ARCHITECT.

The Future Cost of Building.

WITH the late rise in the price of building materials, particularly lumber and brick, increase in cost of constructions must follow. To this must also be added the other material fact that contracts, as a rule, have heretofore been taken at too low a figure, and hundreds of *pro ratio* settlements have resulted, by which owners have been benefited. But the universal sentiment of material men and competent contractors against the class of men who go about seeking whom they may devour, *i. e.*, those who undertake work at unwisely low figures, knowing in the premises, so far as they know anything, that it will be impossible for them to execute their undertaking and pay their bills, together with the fact that, as it now appears, there will be enough for all at paying prices, will largely diminish the number of the reckless, don't-care class, and more jobs will fall into the hands of right men, and, as a consequence, in this direction cost of building will advance.

These three things, increase in price of lumber and bricks, and improvement in contract values, must necessarily make buildings more costly for some time to come; yet not more so under the circumstances than the state of things will warrant.

The largest possible price to be obtained is a common rule and maxim of trade in all things, but too much largeness is likely to "kill trade." People generally are willing to submit to a reasonable amount of pressing, but when squeezed too much they are apt to demur—squeel a little. We hope it will not be so in reference to building materials and building matters in San Francisco this season, which now looks most cheering.

The State Booming in Every Part.

FROM every part and section of the State of California, there comes the echoes of boom—boom—boom; and as a matter of course, San Francisco is sharing largely in these grand outbursts and developments which are so rapidly advancing the Golden State to a prominence in the great sisterhood of States, which assuredly presages a condition of things at no distant day, along the present western confines of our great country, the magnitude of which no mortal man can now fully contemplate, nor human foresight comprehend or foretell.

The general law, commercial, agricultural and other interests everywhere abounding, are duly heralded in the daily journals, with but little exaggeration. A glorious era has dawned upon the Pacific Coast, and every portion of its vast limits is enjoying the cheering and refreshing influence of substantial prosperity. Money is abundant and seeking investment, and while thousands of enterprises are being prosecuted with beneficial and profitable results, others are being sought after, and men of energy and means not only stand ready to take hold of any new proposition that promises fair return, but are themselves prospecting—searching for new fields in which to plant largely and freely of their abundance. All of which pictures a beautiful future for every willing heart and hand, and opens up prospects for the working and laboring classes, never before more brilliant.

During more than a quarter of a century, this golden scion of the American Union remained in its incubating state, to a large extent incased in the shell of its own isolation, and hedged in by the prejudices of millions of our own people, and those of other nations, who refused to grant us more than a humble name and place among the civilized communities of earth; but time and the inevitable force of circumstances, and irresistible proofs of inherent resources and greatness, have brought around the period when these shells could no longer hold the gigantic life within, and this heretofore divided and much abused portion of the land of freedom and liberty stands forth in all the glory of its long-restrained grandeurs and resources; and eager thousands from every part of our own and foreign lands, are seeking its glorious climate, its soil, and its innumerable inviting and incomparable resources and advantages.

As a natural consequence under this state of things, millions upon millions of dollars are being expended in buildings and improvements of every description. Not a single competent building mechanic or architect is at most more than temporarily unemployed. In most parts of the State, although thousands of working people are rushing hitherward monthly, there is a demand for qualified workmen, and not only in San Francisco, but in other cities and places, proficient draughtsmen cannot be found to supply the demand for help in the offices of practicing architects.

The building reports appearing in each issue of this journal, furnish some criterion for judgment as to the immense volume of building operations, yet this with safety may be doubled or tripled within the actualities that exist. Nor is this spasmodic. There is the tone of permanency in it all, which presages continuance, and men of energy, activity and enterprise may safely contemplate measure of wealth in the future according to the degrees of wise judgment and prudent enterprise entered into. Folly and reckless adventure are ever the forerunners of loss and disappointment, but those who embark upon the present crystal stream of general prosperity, guided by caution, prudence and good judgment, may reasonably anticipate early and safe arrival at the port of financial success.

Getting Oil out of a Grindstone.

YOU can get the oil out of a grindstone if you will mix a pail of whiting and water to the consistency of thick cream. Move the grindstone near the stove, or where it can be made and kept as hot as its safety will allow. Give it a thick coat of whiting by spattering it on with a brush. It will soon get saturated with the oil. Then scrape it off, and repeat until it is all extracted.

Mantel Bed, Opened.

THE Ideal Folding Bed is one of those sensible, convenient, and practical household necessities that appeal at once to the good-will of the intelligent housekeeper. It folds under a mantel board, can be entirely concealed by curtains, and is, when desired, detachable from the frame, and may be rolled, upon castors, to any portion of the room. The spring is of woven wire, is very durable and comfortable, and the entire bed folded with all of the bedding, occupies but fifteen by sixty-two inches.

Waifs from the World of Wood.

A CURIOUS geological phenomenon exists in the vicinity of Behring's Strait. At Elephant Point, Kotzebue Sound, a ridge two miles wide and 250 feet high seems to be a vast mass of ice, thinly covered with clay and vegetable mold. In this soil birches, alders and berry-bearing plants grow luxuriantly, with the stratum of perpetual ice as the underlying rock within less than a foot from their roots.

Nutmegs grow on little trees which look like small pear trees, and which are generally not over twenty feet high. The flowers are very much like the lily of the valley. They are pale and very fragrant. The nutmeg is the seed of the fruit, and mace is the thin covering over the seed. The fruit is about the size of a peach. When ripe it breaks open and shows a little nut inside. The trees grow on the islands of Asia and tropical America. They bear fruit seventy or eighty years, having ripe fruit upon them all the season. A fine tree in Jamaica has over 4,000 nutmegs on it every year. The Dutch used to have all this nutmeg trade, as they owned the Banda Islands and conquered all the other traders and destroyed the trees. To keep the price up they once burned three piles of nutmegs, each of which was said to be as big as a church. Nature did not sympathize with such meanness. The nutmeg pigeon, found in all of the Indian Islands, did for the world what the Dutch had determined should not be done, carried the seeds, which are their food, into all the surrounding countries.

The crop-destroying rabbit appears to be not the only animal plague of Australia. The decay of the forests is traced by Rev. P. Macpherson, of the Royal Society of New South Wales, to the opossums. After much investigation it was ascertained that a single animal would devour about two hundred leaves of the eucalyptus, or blue gum tree, in a night, proving that the 18,000 opossums killed annually in one county in Victoria were sufficient to destroy upward of thirteen thousand trees and lay bare a space of 700 acres, or more than a square mile.

The oldest tree in the world is said to be the cypress of Santa Maria del Tule in the Mexican State of Oaxaca. It is thought to have spanned the whole period of written history. Humboldt said that in 1801 it measured 42 feet in diameter, 146 in circumference and 282 feet between the extremities of two opposite branches.

By a new process of manipulation hats which it is claimed are more serviceable and finer than anything now on the market are made from wood pulp. They are impervious to water and not wanting in flexibility. It is claimed that felt hats will have to take a back seat as soon as the new hats can be placed on the market in sufficient numbers to supply the demand. They are certain to revolutionize the hatters' trade, as they can be moulded in any shape or style desired and colored to meet the taste of the public. They can be made to have a glossy or nappy appearance.

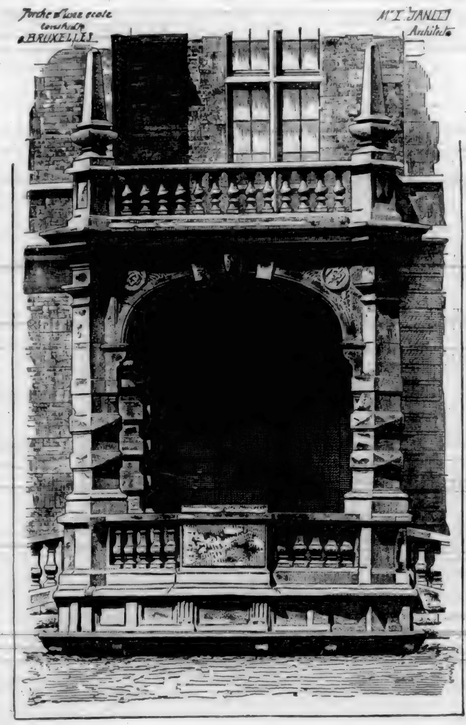
The largest tree in California is in Tulare County, and is 450 feet high, and the trunk is 138 feet in circumference. It is called the "Father of the Forest."

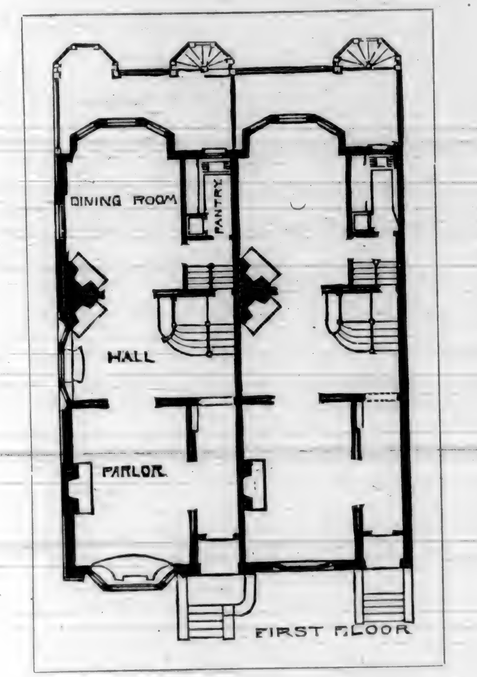
A marine alga of Arctic regions grows at a temperature far below zero, and its spores disappear at higher temperatures. It thus appears that intense cold is necessary to the existence of some forms of vegetable life, together with extreme dryness, and this class of plants includes the cryptogams of red snow.

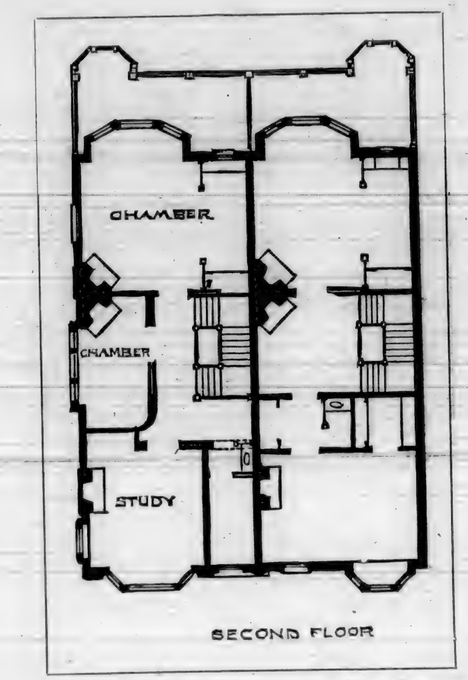
Mahogany is being rapidly introduced into every part of India where it promises to thrive. A single pound of seeds planted in green-houses in the southern districts have yielded between three and four thousand plants. It is thought probable that the world may some day look to India for its mahogany as well as its quinine, instead of America. The Indian product of the latter has already become so extensive and of such superior quality that the cinchona bark exports of the United States of Columbia are said to have fallen off 50 per cent in five years.

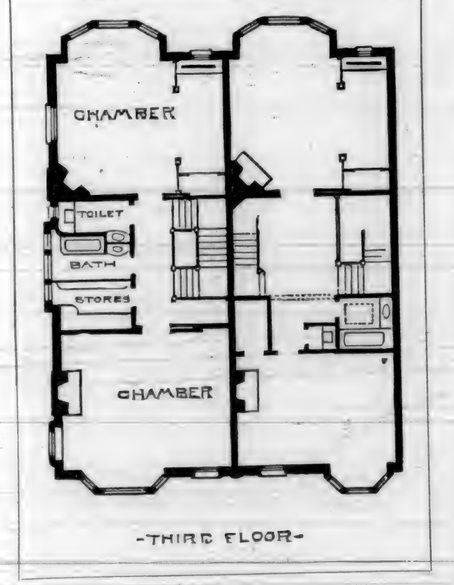
Vast arid and almost rainless tracts in Australia, according to Mr. Joseph Bosisto, of Victoria, are thickly covered with a dwarf eucalyptus, barely eight feet high. The stem of this shrub contains half a pint of water, which bushmen quickly obtain, yet inexperienced travelers often die of thirst.

In the arid regions of Egypt a French botanist, M. Volkens, has found roots twenty times as long as the part of the plant above the surface. On some of these desert plants the same observer has noticed a very curious moisture-absorbing contrivance. Glandular hairs put forth by the leaves yield a bitter crystalline liquid which spreads out at night and collects the dew. —*Lumber World.*









New Books Just Received.

ARCHITECTURAL STUDIES, PART VI., contains twelve designs for houses, costing from $500 to $2,500, shown on a large scale, giving perspectives, elevations, and plans, with which are given specifications, bills of materials, and estimate of cost. Price, $1.00.

SAME AS ABOVE, PART VII. Twelve plates, giving designs for interior wood-work and fittings for moderate cost houses, with full working details. Price, $1.00.

MODERN ARCHITECTURAL DESIGNS AND DETAILS. A few copies remain of this really good work. Price, $10.00.

DETAIL COTTAGE AND CONSTRUCTIVE ARCHITECTURE. Similar to the above in general design.

LEFFELL'S HOUSE PLANS. $3.00 post-paid.

SCIENCE OF CARPENTRY MADE EASY. Price, $5.00.

MECHANIC'S GEOMETRY, or the Science of Framing by the use of Card-board Models. $5.00.

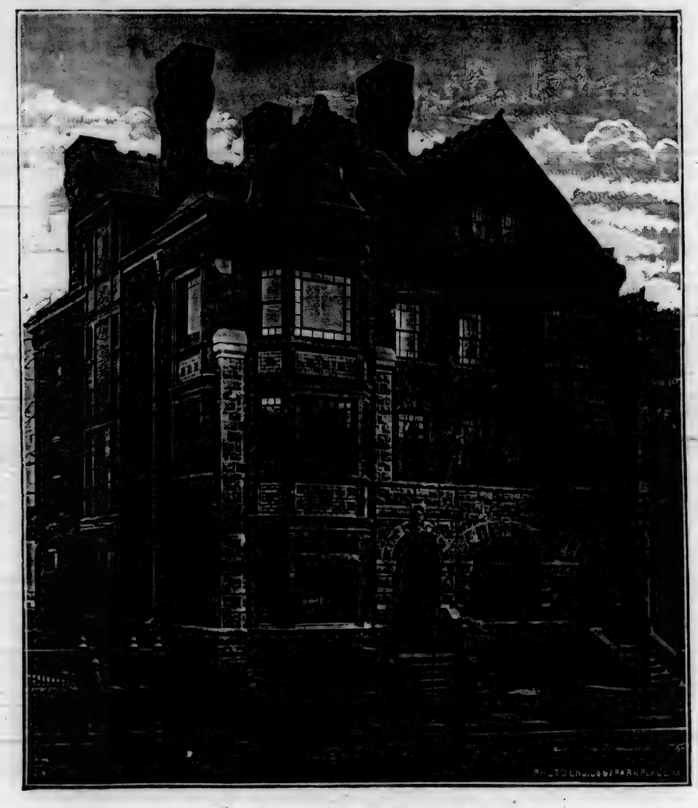
We will send the California Architect for one year, *free*, to purchasers of either of the latter two works.

THE AURORA, a family magazine. Printed by Bacon & Co., San Francisco. With no "continued stories," clear type, exceptionally good reading matter, the *Aurora* recommends itself as an interesting family magazine. The price, for such first-class matter, is exceptionally low, being but $1.50 per year. The San Francisco News Co. is the general agent, to whom orders can be addressed.

Corrugated iron conductor pipes are better than tin. In the first place they will expand when filled with ice, without bursting, and in the second place outlast tin.

CONTRACTORS, ATTENTION!

For $5.00 we will insert your business card for one year, and send you this Journal, free.



A Stylish Double Residence.

A Stylish Double Residence.

THE elevation shown, and the accompanying plans on opposite page, are well worth the study of those who seek for an attractive, stylish house, having all the modern improvements.

The unique and imposing character of the exterior is aptly illustrated by the illustration. The materials are brown stone, over burnt brick and terra cotta, harmoniously combined. The stoops and vestibules are paved with mosaic, and the side walls of the latter tiled to the ceiling. Broad piazzas run the entire width of the rear at the first and second stories.

The interiors are spacious and home-like in appearance. The doors, trimmings, floors, and all the wood-work on the first story are intended to be of antique American oak, enriched with teak-wood carvings. The woods to be employed in the upper stories are ash, cherry, white and yellow pine, with cabinet finish throughout. All the floors to be double and polished.

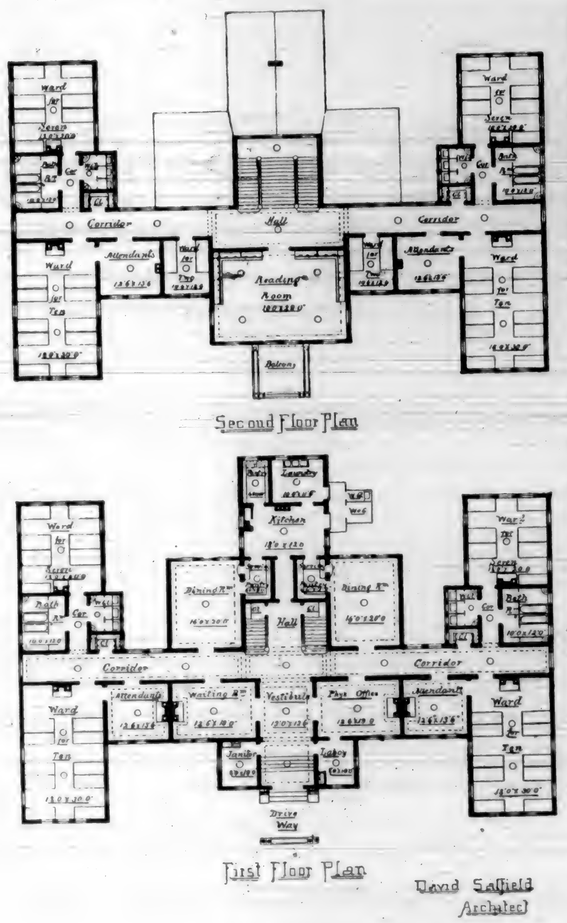
Original designs in old copper are to be used for interior hardware. All the fire-places and wash-stands are to be handsomely tiled. Especial care to be taken with the plumbing. Among the many features which can merely be mentioned are duplex furnaces, French ranges, porcelain washtubs, large ice closets, electric bells, speaking-tubes, and burglar alarms.

W. C. Taylor, architect, is the designer of the building. We are indebted to J. P. Hayward, of the *Real Estate Bulletin*, for the use of all cuts in connection with this article.

Introduction of Oil Painting.

FOLLOWING is a translated extract from the Italian work of Vasari as to the introduction of oil painting: It happened that John of Bruges, pursuing the art in Flanders, and much esteemed in those parts for his great skill, set himself to try different colors; and being a man who delighted in alchemy, he labored much in the preparation of various oils for varnishes and other things. Now it happened upon a time that after having given extreme labor to the completion of a certain picture, and with great diligence brought it to a successful issue, he gave it the varnish and set it to dry in the sun, as is the custom. But whether the heat was too violent, or that the wood was badly joined or insufficiently seasoned, the picture gave way at the joinings, opening in a very deplorable manner. Thereupon John, perceiving the mischief done his work, determined to proceed in future so that the same thing should never injure his work in like manner. And as he was embarrassed both by his varnishes and by the process of tempera painting, he turned his thoughts to the discovery of some material that would dry in the shadow, to the end that he need not expose his pictures to the heat of the sun. Accordingly, having made many experiments on substances pure and mixed, he finally discovered that linseed oil and oil of nuts dried more readily than any others of all he had tried. Having boiled these oils, therefore, with other mixtures, he thus obtained the medium which he, or rather all the other painters in the world, had so long desired.

He made experiments with many other substances, but finally decided that mixing the colors with these oils gave a degree of firmness to the work, which not only secured it against all injury from water when once dried, but also imparted so much life to the colors that they exhibited a sufficient luster in themselves without aid of varnish; and what appeared more extraordinary to him than all beside was that the colors so treated were much more easily united and blended than when a tempera. Rejoicing greatly over this invention, as it was reasonable he should do, John then commenced a multitude of paintings with which he filled all those parts, to the great delight of all who beheld them, as well as with very large gain to himself, his experience increasing from day to day, and his pictures constantly attaining to a higher degree of perfection.—*Painters' Magazine.*



Plan of Country Hospital.

Is It a Curse?

In 1840, says the *Age of Steel*, when there was no wood-working machinery worth mentioning in use, one person out of every thousand was a cabinet-maker or upholsterer. In the ten years following, wood-working machinery came largely into use. Now, if machinery is a curse to the mechanic, it must be because it deprives him of work or reduces his wages. But neither of these conditions followed the introduction of machinery; on the contrary, in 1850, in a population of 23,191,000, there were 23,522 furniture-makers, or one to every 985 people; and annual earnings had advanced 20 per cent. In 1860 the proportion of furniture-makers to population was the same as in 1850, but during the ten years wages had advanced so that whereas the mechanic (averaging all classes, including children) in 1850 earned $298 per year, in 1860 he was earning $327. Bringing the comparison down to the year 1882, the number of operatives had increased to one in 657 of population, and the average annual earnings of each operative had increased to $434.70. Of food products, a dollar will purchase as much now as it would in 1850, and a very much greater quantity of manufactured products; so the difference in annual earnings between 1840 and the present, considered relatively to its value—that is, its purchasing power—is enormous. It therefore appears that, as the use of machines has multiplied, the demand for operatives in the furniture industries has increased, and the annual wages have also increased about three-fourths.

Security Against Thieves and Tramps.

The Folding Gate and Guard Company are offering to the public a device for securing the entrance to their stores and dwellings, which should receive universal, public attention and favor. It is neat in design and general appearance, practical and safe in construction and application, and convenient for all the purposes for which it is intended.

Folding, as it does, into small compass, and being at all times accessible, it is preferable to those cumbersome appliances which require much handling and stowing away at the opening and closing of places of business, and affords perfect security against burglars and desperadoes, not of the most daring and aggressive class. In dwellings and places provided with this safe-guard, any door may be left wide open, and a full current of ventilation obtained, without danger of ingress by miscreants. They are worthy of the attention of every occupant of either store or dwelling, being alike applicable in all cases.

A GIANT MONOPOLY.

A Lumbermen's Organization on a Large Scale.

A Proposed Plan Which Will Give Control of the Trade in Redwood to a Syndicate, and Insure Immense Profits.

The redwoods of the Pacific are the only ones of that lumber on the face of the globe. Their area is 4,125 square miles. Government experts give the average feet of lumber to the acre at 50,000; practical lumbermen make it 100,000 feet. Some places, such as Eel River Valley, give half a million feet per acre. The total quantity is about 264,000,000,000 feet. Most of the land bearing this vast and valuable source of wealth is already in the hands of private capitalists, *i. e.*, the millmen, who have been quietly obtaining titles to large tracts. They at any rate control the avenues of approach to the redwoods, and may be considered masters of the situation. That such they consider themselves is evident, for within the past few days they have arranged so as to control the production, price and export trade in one of the most valuable lumber products of the world. The redwood is practically indestructible compared with other woods; does not take fire as readily, and can be polished till it looks to the eye like colored marble.

For a short time past all the leading redwood magnates of the coast have been in the city perfecting their organization. The proposed plan contemplates a depot on the other side of the bay, probably near Vallejo, where this lumber will be stored and dried. Here all cargoes will, it is said, come; hence it will be distributed throughout the interior, sold in the city, shipped East by railroad and exported abroad. What is intended for the lower coast will not, however, come here, but will be shipped direct. The plans are all perfected. The only thing that troubles the lumber magnates is that the provisions of the interstate commerce law will advance the rates on shipment East. The quantity to be handled here will be from one hundred to one hundred and twenty million feet a year.

This, however, does not give a proper idea of the value of the trade, and of the importance of the step taken. The total cut of redwood in 1887 was 228,769,251 feet, worth in San Francisco $5,000,000—reckoned at $20 per thousand for rough redwood. The price was advanced in 1886 $3.00 per thousand. It may be estimated that one-third of the $5,000,000 is profit. Another advance of $3.00 would add the modest little sum of say $750,000 in 1887 to the millmen's profits. This will be a great year for building all over the State, and the parties in this little combination can, if they make the advance, pocket a profit of say a million and a half dollars.

Scratching Matches on Paint.

A correspondent speaking of the defacement of paint by inadvertent scratching of matches, says that he has observed that when one mark has been made others follow rapidly. To effectually prevent this, rub the spot with flannel saturated with any liquid vaseline. "After that people may strike their matches there as much as they like, they will neither get a light nor injure the paint," and, most singular, the petroleum causes the existing mark to soon disappear, at least when it occurs on dark paint.

Design for a County Hospital Building.—D. Salfield, Architect.

Some Facts about Saws.

Cutting-off saws are the subject of much abuse, from the fact that the work required of them generally is not as fine as of splitting saws. It is not necessary that slabs be cut square or smooth; so the saw is not filed or set as regularly as board-saws. Further, there is not near the care bestowed on them that they should have. They are wrenched, twisted, and broken by the cheapest help that is employed about the mill.

Small and fine cutting-off saws for trimming finish lumber are better cared for; indeed, it is a necessity that they should be, to do the work so it will pass. Nevertheless, I wager that nine out of ten take double the power to drive them that is necessary, and one-half are so filed and set that the work is not smoothly done.

A saw, the teeth of which pitch both sides of the eye alike and set very little, may cut or wear away the lumber quite smooth, but at the expense of power and time.

The class of saws run by power, known as drag or butting saws, come in for an equal amount of abuse. The same may be said of "cross-cut" saws, for cutting mill logs and felling trees. Still further, that saw which is recommended as a cure for dyspeptics—the "buck-saw"—is most generally in a condition to induce the disease instead of curing it.

The carpenter's saw is mostly in better hands; for a carpenter is a mechanic, and comprehends the conservation of forces enough to know that a saw nicely filed and set takes less muscle and does the work more to his liking than the one that is badly filed and set. This class of saws is in good hands enough, so I shall say but little about them.

The principles of speed, tension, and causes of breakage from sharp corners filed at the bottom of the tooth, hold good in circular cut-off saws the same as in circular splitting saws. But it is much more difficult to avoid a sharp corner in this class; so I suppose they will have to take the chances for a while yet. But there are other causes of breakage, and a remedy. Of this I shall speak.

Experience and experiment have demonstrated that the best form of cut-off teeth is on the principle of the dado head, that is, cutters and clearers. The saw that has one tooth to every inch of circumference should have four cutters and one clearer. The cutters should have a double shear on the back so it is quite pointed, and a shear of five to eight degrees on the front. More than that causes the tooth to spring sidewise and make set, cracking the plate thereby. The clearer should be filed square, that is, at right angles with the plate. No set by bending; the front should pitch back of the center somewhat. The point should be hammered so as to produce a hook. Use a light hammer, inclining the face of the hammer backward, so the top of the hook will clear the circle of the cut. This shortens the tooth and widens the point. The result of this method is rather shavings instead of sawdust.

The amount of set, of course, is governed by the kind of lumber that is cut. A cedar shingle bolt requires much more set than oak or maple.

The cause of breakage is this: without clearer the core or center tends to spread the shear outward, as it is set pulling in opposite directions. With a clearer the core is cut out as fast as made. It strikes me this method is so reasonable that it needs no further demonstration. It is not original with me, but I do not remember to have seen it in print.

Another cause of breakage of cross-cutting circular saws is the tension. They are not "open" enough. They are invariably hammered straight, that is, even tension throughout, and the edge is strained by labor and speed so that a twist of the cant causes a break. Of course, all things being right, a saw may be broken by too much twisting, but if they are hammered open so they will fall away from the straight edge somewhat on the cross test they will stand a deal of hard usage.

The principle of cutters and clearers holds good in all cut-off saws, except it may be in fine, smooth, and slow work. In this case the saw should be absolutely round and even set, or no set, and a concaved saw.

The principle of clearers in drag saws is equally essential for fast work. I have put a drag saw through a twelve-inch frozen beech in six strokes, having every sixth tooth a clearer; the teeth one and one-fourth inches long, slightly hooking, filed double shear, the clearer having the point hammered hooking and one-tenth inch shorter than the cutters.

My attention was first called to this method by a tree-sawyer who was very successful in sawing down oak trees in Massachusetts (where they fairly scrape the ground to save timber). The saw he used was the style of two clearers and four cutters. I noticed the saw-dust in shavings form, sometimes three inches long. I found his method was to hammer the points of the clearers to a nice hook, so it cut instead of scraping.—*C. E. G., in Mechanical News.*

Tin roofs should always be painted on the under side with mineral paint and be laid in single sheets, flat lock.

Common brick work will sustain 800 pounds to the square inch before crushing and weighs 112 pounds to a cubic foot.

White paint, white furniture, curtains, white walls, and white woodwork are the latest agony.

In finishing California redwood the filling should be stained with a little crimson lake.

ASKED, ANSWERED, AND COMMUNICATED.

We intend to make a specialty of this department of our journal, and, in order to make it thoroughly interesting, we desire the co-operation of all architects, mechanics, etc., whether subscribers or not. In this column there is a great opportunity for comparison of ideas on the practical questions of the day; and we hope to receive from those interested, and especially amongst builders, questions arising in their daily practice. No matter what may be the solutions given to the various problems presented, we shall only be too pleased to receive replies from our readers, where they see other and better solutions for them. If a general interchange of ideas can be brought about, great advantages will ensue to all. Let not a month go by without bringing up for discussion practical topics in the architectural, mechanical, or scientifical pursuits, We desire a general expression of opinions, for or against, of every article presented by us. Every communication will receive deliberate and careful consideration.

About Miters.

PRACTICALLY it is quite as easy to make a good miter as it is to allow an imperfect one to suffice, and although a little more time may be absorbed in doing so, yet its effect upon the cost of manufacture is not sufficiently great to merit serious consideration.

One point to which we would particularly draw attention is that of making a miter a perfect joint, each piece fitting close to the other at all points, and not simply at the upper edge, or at the edge which meets the eye. Such a miter as this has no strength in itself, and never can be depended upon. It holds itself together because the mouldings or whatever the part mitered may be is firmly fixed, and not because of any strength in the miter itself. The larger the miter, in the case of mouldings especially, the more careful ought the man to be in making the joint quite true in all points, so that when fixed together the miter may be glued and so better enabled to stand and remain intact.

The most important axiom of the cabinet trade—that all the material used in the construction of work must be thoroughly dried and seasoned—holds good in this as in all other branches. If the wood be not quite dry, then the miters will never be as perfect as they should be, for no matter how well they may be made in the first instance, the shrinking and possible warping of the wood, after the first job has stood for some time, overturns all calculations and destroys at once all possibilities of good and perfect workmanship being maintained.

As we have had occasion to mention before, mouldings mitered around pillars, or which are so narrow that their safety, when in prominent positions, is a matter of conjecture, should be strengthened by being grooved to a slight depth, say one-eighth inch, into the rail or pillar upon which they are placed. It entails no further trouble in mitering, and is not very difficult to accomplish if done before the job is put together.

All mouldings that have many internal miters—such as is the case in frames for over-mantels and side-boards etc.—being filled with numerous small panels, should be polished before being fixed into the rabbet. A much cleaner job is thereby insured, and, if carefully fitted afterward, no trouble will be experienced in leveling off the polished surface of the wood.

The latter is the objection usually urged against this mode of procedure, but if properly done, all the leveling might very readily be effected from the under side, thus leaving the polished surface untouched. By this means the miters will be quite free from the collection of polish and filling-in which usually gathers in the corners if the mouldings are polished after the job is completed by the cabinet-maker. Therefore, the plan we recommend should be adopted in every case where possible.

With regard to the proper intersection of all the members of the mouldings that may happen to be under manipulation, we should like to say that unless the miter be a perfectly true one, it is impossible for the intersection to be satisfactory, and will have to be in a manner forced by "cooking" the miter, easing off and paring away until the different members meet each other in a proper manner. We need hardly add that a miter which has been finished off by this carving process will be far from being what it should be, and will never present the neat and clean appearance which is so desirable. We would also like it to be clearly understood that although a perfect miter includes and consists of a perfect joint, yet a perfect joint, however close it may be, is not necessarily a perfect miter. Unless the man works each piece which he may happen to be mitering in the miter-trap, or shooting board, as the case may be, and guages and corrects it by means of a bevel set to a true miter—an angle of 45 degrees—he is very apt to make one piece a little longer or a little shorter than its fellow, and although the result may be a perfect fitting joint, yet the probability is that it is not a miter, and will therefore not intersect as well or as neatly as it should do.

The question, as argued by many men, as to whether scribes or miters are the better for cabinet work is not one that can be settled off-hand. Both are very good, equally so we might say, in their way, and if thoughtfully introduced the scribe will prove itself a very valuable substitute for the miter. In making a scribe we should advise the workman to make its shoulder cut inwards from the point of contact, so that it becomes rather thin on the edge. By this means, when the joint is not as close as might be wished, the application of a clamp would very easily draw it up.—*Builder and Woodworker.*

THE CARLAND TRAP.

IT is a sure seal or safeguard against sewer gas. All danger from *evaporation* or *syphonage* overcome. It prevents back water. Should all the water *evaporate* out, it is still a *shut-off* against sewer gas. It has an opening at the bottom and top to remove any obstruction. The loaded ball valve F, is slightly heavier than water; it floats up and around the chamber while the water is flowing out, afterwards falling gently into its seat, thereby forming a shut off against the induction of sewer gas or back water.

TO ALL WHOM IT MAY CONCERN:—About four years ago I had one of the "Garland Traps" put in my office, where it has been in constant use and has given entire satisfaction. I was greatly annoyed by both sewer gas and back water until I had this trap put in, since which time there has been no trouble whatever. I consider my place a particularly *severe test case* of the *superiority* of this trap, and after using it four years, heartily endorse it as the only good and reliable trap in the market.

DR. C. O. DEAN,
126 Kearny St., S. F.

Value of Pictures in Rooms.

A ROOM without pictures is as barren as a room without windows; each shed light and cheerfulness on surrounding objects. Nothing, we think, is more melancholy, particularly to a person who has to pass much time in his room, than blank walls; for pictures are loop-holes of escape to his soul, leading it to other scenes and other spheres. It is such an inexpressible relief to a person engaged in writing, or even reading, on looking up, to find his soul escaping, as it were, through the frame of an exquisite picture, to other beautiful and perhaps idyllic scenes, where the fancy for a moment may revel, refreshed and delighted.—*Sel.*

Design for a Building to be Built of Cleveland Stone.

Tin Roofing Plates.

IF the foundation of a building is paramount in construction, as doubtless it is, the roof which is to protect the whole edifice is only second in importance. The qualities of tin as a roofing material rank high, as may be amply proved by the great popularity it has attained during the past few years. Convenient in application, durable, and very economical, it has gained in favor and is now employed to a far greater extent than any other material throughout the country.

Of late, tin roofing has been severely attacked on all sides. With the competition of these days and the consequent reduction in the price of roofing in this description, much of the material has been of far inferior quality to that produced in former years. With the lowering of price, we get a corresponding reduction in the quality of the material, so that at the present time the market is stocked with tin plates, many of them of so inferior a quality as to be wholly unfit for their purpose.

Under these circumstances, it is a pleasure to refer to the plates of Messrs. Merchant & Co., of No. 525 Arch Street, Philadelphia, who have also offices at New York and Chicago. This well-known house issued the first quality of plates in the market, under the name of "The Gilbertson Old Method." They are of far greater weight than usual, averaging 120 pounds for each box of IC 14x20, and have an extra thick coat of uniformly good quality. To prevent fraud, and guarantee that the purchaser shall get what he is paying for, each sheet is stamped with the name and thickness of the metal, and thus the owner and architect have insured the proper performance of the contract by the builder, in this important respect at least.

We have not space here to show the material gain from a pecuniary point of view, effected by the use of a good quality of roofing, but that it is the truest economy in the end there can be no doubt.

The house of Merchant & Co. has long been identified with the best quality of tin plates, and no better proof could be had of the justice of this than the fact that their goods were chosen, after undergoing the most thorough and severe tests, for the White House at Washington, and this at a price higher than that of their competitors.

We have had enough of bad roofs and more than sufficient of the grumbling of builders, owners, and architects at the poor quality of tin plates. Let them use the goods of Messrs. Merchant & Co., and see that they are properly laid, and there will be no further cause for either the one or the other.

Tay & Co. are the authorized agents in San Francisco for the brand of tin mentioned.

A New Work—"Architectural Studies."

WE have before us Parts VI and VII of "Architectural Studies," just issued by William T. Comstock, of New York.

The first of these is devoted to small and low-priced country houses, giving among them a number of designs that can be executed for $1,000 or less. One is impressed, in looking over these designs, at seeing how much a little good taste can do for the improvement of houses where only a small sum of money is to be expended. The second of the two, Part VII, is devoted to the interiors of moderate-cost houses, giving a large number of examples of window finish, wainscoting, window-seats, staircases, hall and library finish, book-shelves, china closets, mantels, bath-room fittings, with full working details drawn to large scale, carrying out the idea of good, tasteful, but moderate-cost interior fittings, as Part VI does that of good planning and well proportioned exteriors, the whole scheme being to furnish suggestions for building, a good, comfortable home, after a well-thought-out plan and within the limits of a moderate purse. They are published in paper, portfolio, at the cost of $1.00 each.

PLASTERING and lathing are usually estimated by the square yard. Local customs govern the allowance to be made for opening closets, etc. In some localities it is the custom to deduct all openings, such as windows and doors. In other places half of the openings are deducted, while the custom in still other sections of the country, is to measure on all openings and figure them in. Closets, presses, etc., in one place, would be figured at their actual surface contents, while in other sections of the country the contents of the surface would be doubled. Suppose you desire the number of lath to lay a square yard. The calculation of this is very simple. A standard lath is 1½ inches by 4 feet long, and consequently contains one-half of a square foot. It would, therefore, take 18 lath to lay a square yard of surface if the lath were laid close together. As a rule, however, the lath fall sufficiently short in width to allow for the openings which are left between them. Each bundle should contain 100 lath. As some bundles fall short of this, and as there is more or less waste in cutting, it is necessary to make an allowance, and each lather has a rule for this, resulting from his experience, which varies from 20 to 22 lath to a square yard.

An inch of well-haired mortar between floors will be found to effectually deafen them against sound.

CARPENTERS' STEEL SQUARE AND ITS USES, PRICE $1.00.

Carpenters Here and Abroad.

THE carpenters of the United States enjoy a great many privileges unknown to the European artisans, and occupy a social position much higher than do their English cousins. It is a poor carpenter in America who cannot make three dollars a day, while abroad finished workmen hardly get that sum a week. A comparison of the carpenters of the United States and the carpenters of London, serves to show how much higher in the social scale are the American workmen.

There are about 20,000 men in London who make their living as carpenters and joiners. Of these, nearly 5,000 are inexperienced workmen, and are not allowed to belong to the various trades organizations, toward which the spirit is very strong. There are two large trade societies in London. The Amalgamated Society of Carpenters and Joiners is the larger, and at present is composed of 3,000 members in London, and 26,000 in other places in the kingdom. Next is the General Union of Carpenters and Joiners. This Union has 1,000 members in London, and about 6,000 throughout the kingdom. Thus, it will be seen, that only about one-third of the workmen are trade-unionists, partly because the Unions are for insurance as well as for trade purposes, so that age and other restrictions keep out many who are in sympathy with the Union. Expert carpenters in London do not get half the wages of American carpenters. There are few carpenters here who will work for less than 30 cents an hour; there are equally few in London who get more than 18 cents an hour.

The regulation hours and pay—that is, 52½ hours a week at 9d. an hour—are quite generally enforced all through London, although some few firms get more and give less. Uniform pay has brought out another class of carpenters who are not benefited by the uniformity. These are the unskilled workmen, who are paid all the way from 3½d. to 7½d. an hour. There are very few apprentices in London, as neither masters nor men like to be bothered by having them around. This system has not yet forced the importation of German skilled mechanics, which importation must in time necessarily follow, as it has in other trades in which apprentices have been done away with.

The social condition of most London carpenters is deplorable. Few have any means at all of comfort or enjoyment, and, more than that, there is a lamentable lack of the necessities of life. They live, ordinarily, in a few rooms, for which the rent averages from $2 to $4. Taxes are paid by the landlord. To help out, the children are put to work as soon as old enough, and sometimes as much as $10 a week is added to the family purse by this means. These families ordinarily breakfast on bread and butter and tea. Dinner depends largely upon the state of the family purse.

In hard times, all money must go for food to keep the man strong and well, so that the wife and children are frequently obliged to make all their meals of the same monotonous diet. The carpenters, when working right along, make about ten dollars a week, but out of this sum must come reductions for the sixteen compulsory holidays that occur during the year; they, however, average about six months of work. Of course, some carpenters save money, and eventually become foremen. Some keep a small store in connection with their trade, and thus accumulate money. On the other hand, some sink into utter wretchedness, thus making the average condition lamentable.

The Parisian carpenters are much more intelligent, and their social condition is much higher than that of the London carpenters. Their number is daily decreasing, owing to the introduction of bronze and metal cornices and other constructions that were made of wood. The tendency is very strong for secret societies. The most important is the fraternity of *Compagnons du Devoir, or Compagnons Passant.* The different degrees of the order are designated by the names of animals, such as the wolf or dog.

There are no engagements between the workmen and the bosses. The *patron* can dismiss his workmen at any time he pleases without any notice whatever, and the workman can put his tools on his back and knock of work also at any time without giving notice. However, when the *patron* dismisses the workmen he must pay the latter the entire day's wages for the day of dismissal.

Wood is so deer in France now that a builder can import his doors and sashes from Germany cheaper than they could be made at home. The carpenters live decently, however, and while much below the plane of the American mechanic, he is much above the London workmen.

Probably the best situated workmen as regards work and wages, and the most discontented and distrustful of all, are the German carpenters. Most of them are Socialists, and on elections they vote solidly for the red candidates. As there is considerable building going on in Berlin now, there is plenty of work, and wages are fair. They live comfortably as a rule, although some of them are in poor circumstances. The average German workman is not happy unless he has at least one strike in a year, and more are frequent. Political trades-unions have been suppressed by the Government, and now the majority of carpenters belong to the great Carpenters' Association, which numbers more in membership, probably, than any other existing trades-union.

Reviewing the situation of all four classes of mechanics, the American workmen are in far better circumstances than any of the European.—*Manufacturer and Builder.*

BUILDING PROPOSALS.

Plans and specifications for the building of the University of Arizona will be received at the office of the Board of Regents, at Tucson, A. T., until Monday, May 2, at 10 A. M.

The design for the buildings must comprise within its scope, plans and specifications to include (under the law) accommodations for the following departments:—

1. The department of science, literature and the arts.
2. The department of theory and practice and elementary instruction.
3. The department of agriculture.
4. The normal department.
5. The department of mineralogy and school of mines.

The Regents desire plans and specifications, which will provide for all these departments, and which will constitute a complete university, modeled upon the most approved methods, comprising in architectural design all the latest improvements in mechanical skill that will add to the comfort and convenience of pupils and the advantage for proper training.

It is the intention of the Board of Regents to inaugurate this enterprise by the erection of a single building or portion of a building at present, as the funds now on hand are only sufficient for that purpose. They desire that this first building shall serve as a model for all the others to be erected.

It is the intention to devote the funds now on hand for the establishment of a school of mines and when the plans and specifications have all been received and a selection made, it will then be determined which of the buildings included in said plans and specifications will be the most suitable for the department of mineralogy and school of mines, and the work of constructing this building will then begin.

All the buildings are to be of stone or brick, and to be built upon a plan most suitable for this climate, and with a view to their substantial and permanent character. The Regents desire to call special attention of architects to the necessity of providing means for the greatest shade around the buildings to protect the occupants from the great heat and light consequent upon the hot, dry summers of Arizona. They should be erected upon a plan which will admit of their future enlargement without destroying their architectural beauty and design.

The amount to be used for the building now under consideration cannot exceed the sum of twenty thousand dollars ($20,000).

The amount of $500 will be paid for the design accepted by the Board, reserving to itself the right to reject any or all plans and specifications submitted.

CHARLES M. STRAUSS,
Secretary.

A CLOTHES chute or small dumb waiter from the second story to the laundry are a great convenience.

BY wrapping plumbing pipes with heavy felt paper they will be protected from frost.

CONTRACTORS, ATTENTION!

For $5.00 we will insert your business card for one year, and send you this Journal free.

COUNTRY
BUILDING INTELLIGENCE

In this and succeeding issues we intend to devote considerable space to information in connection with buildings, from every portion of the coast.

Only reliable news will be found in this column. Our custom has been for the past eight years, to furnish only data which could be relied upon. We will not publish rumors of "THIS AND THAT IS GOING ON" unless we are reasonably assured that such is truly the case. We have been busy the past two months in perfecting arrangements by which we can secure information from every portion of the Pacific slope. In all cases we will file our authority for any statements made in this column. No doubt mistakes will sometimes occur, but these we intend to be a rare exception to our rule of reliable news.

For eight years there has appeared in this journal, building news from every portion of the country. But in its condensed form it did not attract the attention it deserved. We begin the New Year by making a specialty of the item mentioned.

We desire the co-operation of country editors and mechanics to this department of this journal. By spreading the news of building engagement in your part of the country, you enhance the value of your section by proclaiming it a go-ahead community.

Architects should also notify us of "plans to figure on;" we do not charge anything for the insertion of such notices. Remember this journal is in the EIGHTH YEAR of its existence, and is the only journal published this side of the Rocky Mountains in the interest of Architects, Contractors, and Material Men.

Alameda.

A cottage is being built on the corner of Park Street and Blanding Avenue.

Artisan, for $5.00.
Builders' Guide, for $2.00.

J. H. Young will shortly commence the erection of three cottages on Clinton Avenue, corner Oak Street.

Plaster, How to Make it, for $1.00.
Shavings and Sawdust, for $1.50.

Fred Brammam is about to build a cottage on Buena Vista Avenue.

People's Cyclopedia (three large volumes), for $20.00.

A. H. Peterson will erect a large residence on corner of Santa Clara Avenue and Mozart Street.

Builders' Construction (three volumes, very fine), for $14.00.

R. E. Combs will also erect a building.

Album of Mantels, for $8.00.
History of Architecture, for $15.00.

The First Presbyterian Church is to be moved to another part of the town and extensive improvements added. Proposals are invited for the same.

Practical Perspective, for $5.00.
Woodward's Country Homes, for $1.50.

Paul Bunker is to build a $4,000 residence on San Antonio Avenue.

Hand Railing and Stair Casing, for $1.50.
Drawing for Carpenters, for $1.75.

The brick has been purchased for the new Thompson Block, to be erected at the corner of Park Street and Central Avenue. The structure is expected to cost at least $60,000, and will be the finest building in the city. Wm. Patton is the architect.

Shavings and Sawdust, for $1.50.
American Cottage Building, for $3.50.

Two-story frame. Owner, E. M. Battles; contractor, J. Bernard; architect, Smith. Cost, $1,800.

Artistic Homes, for $3.50.
Modern House Painting, for $5.00.

Central Avenue. Two-story frame. Owner, J. E. Youngberg; architect, G. A. Bordwell; contractor, S. J. Shelper. Cost, $3,000.

American House Carpenter, for $5.00.
Cutting Tools, for $2.00.

Beaumont.

A $25,000 hotel is to be built at this place. Formerly this town was known as San Gorgonio.

Building Superintendence, for $3.00.
American Cottage Homes, for $3.00.

Berkeley.

Two-story frame. Owner, S. Perkins; architect, C. Day; contractor, J. Spencer. Cost, $4,000.

Album of Mantels, for $8.00.
Architects' Companion, for $2.50.

East Riverside.

It is the intention to erect a $10,000 hotel at this place.

Woodward's Farm Homes, for $1.00.
Woodward's Graperies, for $1.00.

Fresno.

Joseph Spinney will erect a dwelling.

Grimshaw on Saws, for $4.00.
Mechanics' Geometry, for $4.00.

We understand Hon. J. M. Shannon will shortly commence the erection of an elegant residence.

Science of Carpentry, for $4.00.
Universal Assistant, for $2.50.

D. E. Nichols will erect a two-story brick building.

Lumberman's Hand-Book, for $2.00.
Practical Geometry, for $1.00.

Goldstream, B. C.

James Phair will erect an $8,000 hotel building.

Builders' Companion, for $1.50.
Builders' Work, for $5.00.

Gridley.

Active measures are being taken towards the erection of a $20,000 hotel.

Lumberman's Hand-Book, for $2.00.
Practical Geometry, for $1.00.

Helena, Mont.

A $60,000 club building is proposed.

Grimshaw on Saws, for $4.00.
Mechanics' Geometry, for $4.00.

Healdsburg.

John A. Paxton, it is said, will erect a winery.

American House Carpenter, $5.00.
Cutting Tools, for $2.00.

Kingsburg.

The following parties have signified their intention to build as soon as spring has fairly begun. J. R. Allison, A. A. Smith, E. Winslow, Landrum Smith, O. Warner, Wm. Peakes, J. H. Busikist, Wm. Weymeier and J. P. Clark.

Artistic Homes, for $3.50.
Modern House Painting, for $5.00.

Los Angeles.

Whitter, Fuller & Co., of San Francisco, propose to erect a large brick building.

Cutting Tools, for $1.50.
Cummings' Details, for $5.00.

Monterey.

Material is being handled to replace the fine hotel building lately destroyed. It is calculated that it will take $500,000 to erect the new building.

Cutting Tools, for $1.50.
Home Hand-Book, for $10.00.

Napa.

A syndicate is being formed to erect an $80,000 hotel building.

Wonders of Art, for $1.25.
Limes, Cements, and Mortars, for $4.00.

Oakland.

The State has stopped its manufacture of doors, sash and blinds. The principal firms in that business in the city of San Francisco, have combined, and will erect in Oakland, a large manufactory for above named materials.

Artisan, for $5.00.
Builders' Guide, for $2.00.

Eleventh Street near Market. Two-story frame. Owner, Mary L. Ginn; architects, Matthews & Son; contractor, Geo. L. Voice. Cost, $4,000.

Science of Carpentry, for $4.00.
Universal Assistant, for $2.50.

Peralta, near Sixteenth. Two-story frame. Owner, H. B. Fritzchen; architect, M. P. Schetzel; contractor, M. W. Rain. Cost, $2,500.

Building Superintendence, for $3.00.
American Cottage Homes, for $3.00.

West Street, corner Thirteenth. Two-story frame. Owner, M. P. Brown; contractor, Pattiani & Co. Cost, $3,000.

Builders' Companion, for $1.50.
Builders' Work, for $5.00.

San Pablo Avenue. Two-story frame. Owner, L. Friedman; architect, Chas. Man; contractor, H. McCracken. Cost, $4,000.

Steel Square Problems, for $1.00.
Workshop Companion, for 35c.

Fifth Street near Grove. Frame building. Owner, Mrs. A. Downey; architect, Chas. Man; contractor, P. F. Nelson. Cost, $1,600.

Ontario.

The railroad company intend erecting a fine depot building.

American House Carpenter, for $5.00.
Cutting Tools, for $2.00.

Oregon Items.

Among the new buildings of importance now under way in Portland, or to be built this summer, are a three-story brick building on the southeast corner of Front and Morrison for W. S. Ladd, a three-story brick addition to the building on the northeast corner of Front and Morrison by S. G. Reed, a three-story brick building on the southeast corner of Third and Washington by Henry Fatling, a $11,000 residence on Seventh between Morrison and Alder, six handsome cottages on B between Ninth and Tenth, to cost $12,000, for Dr. Glisan, and a number of other handsome buildings in various portions of the city.

Builders' Companion, for $1.50.
Builders' Work, for $5.00.

A new flouring mill will soon be erected at Elberton, Washington, near Colfax.

Every Man His Own Mechanic, for $3.50.
Tredgold's Carpentry, for $7.50.

Spokane Falls has 5,000 inhabitants, and about 50 buildings are now under way.

American House Carpenter, for $5.00.
Cutting Tools, for $2.00.

A force of men is engaged in getting out stone at the quarry near Coos Bay for the jetty works. Work on the harbor improvement will commence about May 1.

Building Superintendence, for $3.00.
American Cottage Homes, for $3.00.

A force of men is engaged surveying the route of the Seattle & Bellingham Bay Railroad.

Science of Carpentry, for $4.00.
Universal Assistant, for $2.50.

Contract has been awarded for the delivery of 25,000 piles for the jetty at the mouth of the Coquille River.

Plaster, How to Make It, for $1.00.
Shavings and Sawdust, for $1.50.

Ira F. Powers will build a furniture factory in South Portland.

American House Carpenter, for $5.00.
Cutting Tools, for $2.00.

Hoffman & Bates have secured the contract for building the N Street elevated railroad.

Builders' Companion, for $1.50.
Builders' Work, for $5.00.

Sellwood is to have a $4,000 school-house.

Science of Carpentry, for $4.00.
Universal Assistant, for $2.50.

Mrs. Hewett is erecting a residence.

Lumberman's Hand-Book, for $2.00.
Practical Geometry, for $1.00.

Pomona.

Near this town, a large hotel is to be built, at a probable cost of $40,000. Messrs. Park and Oldham, of Pomona, can be written to for particulars.

Artistic Homes, for $3.50.
Modern House Painting, for $5.00.

Portland.

A $35,000 pavilion, in which to hold fairs, etc., is on the tapis.

Practical Perspective, for $5.00.
Woodward's Country Homes, for $1.50.

Reno, Nev.

A two-story brick building to be used as a post-office will be commenced shortly. Wm. Thompson is the manager.

Science of Carpentry, for $4.00.
Universal Assistant, for $2.50.

Riverside.

A saw and planing mill is about to be erected by Messrs. Walker and Banta.

Hand Railing and Stair Casing, for $1.50.
Drawing for Carpenters, for $1.75.

A new Episcopal church on Tenth Street, will be commenced in a few weeks.

Steel Square Problems, for $1.00.
Workshop Companion, for 35c.

Important building operations will soon be going on extensively in the center of the city. A fine block is to go up adjoining the St. George Hotel on the north; an additional story is to be put on Frankenheimer & Lightner's store; a new block is talked of adjoining Wilbur & Reynold's dry goods store; Clarence Stewart will remove the Cochrane second-hand store and extend his building over that, two stories high, adding at the same time another story to his present place of business, and G. D. Cunningham proposes to connect his corner block with the building next to the city hall, making the building occupied by Drs. Woodill & Ainsworth two stories high and arching the alley between the two buildings, giving a uniform appearance from the corner up to the vacant Perrine Block. When C. O. Perrine puts in his four-story block from there to the corner of Orange it will give that side of Eighth a fine, imposing look.

Cutting Tools, for $2.00.
Cumming's Details, for $5.00.

Saucelito.

One and one-half story frame. Owner, Mrs. Small; architect, Behrnd. $2,000.

One and one-half story frame. Owner, Mr. Hamlin; architect, Behrnd. $3,000.

San Luis Obispo.

It is understood that arrangements are being perfected for a $100,000 hotel building.

Grimshaw on Saws, for $4.00.
Mechanics' Geometry, for $4.00.

Santa Ana.

Plans preparing for S. H. Fichenal's new building.

Album of Mantels, for $8.00.
History of Architecture, for $15.00.

Seattle, W. T.

Mrs. Howard H. Lewis will improve her property on Mill Street by the addition of a two-story brick building.

Ruskin's Works (four volumes), for $6.00.
Industrial Drawing for Carpenters, for $2.00.

Stockton.

A. Wolf will erect a two-story bui ding on the principal business street.

Practical Perspective, for $5.00.
Drawing for Carpenters, for $1.75.

Spokane, W. T.

I. T. Benham & Son have secured the contract for a $12,000 hotel. J. N. Squier is the owner.

Drawing for Stone Masons, for $1.50.
BuildingConstruction, for $1.25.

Selma.

A. Barieau is erecting a brick building 90x120 feet, two stories high.

Builders' Companion, for $1.50.
Builders' Work, for $5.00.

H. A. Lemon is putting up a brick building 35x70 feet.

Drawing for Bricklayers, for $1.50.
Drawing for Cabinet Makers, for $1.50.

Geo. B. Otis is having materials hauled for a brick building.

Practical Perspective, for $5.00.
Woodwards' Country Homes, for $1.50.

Kutner, Goldstein & Co. are making preparations to build a brick building.

Science of Carpentry, for $4.00.
Universal Assistant, for $2.50.

Materials are being hauled for the construction of gas and water works.

San Bernardino.

Large swimming baths will be erected.

The railroad company are erecting a round-house with a capacity of twenty-five stalls.

Manual for Furniture Men, for $1.00.
Common-Sense Church Architecture, for $1.00.

A machine shop 90x160 will shortly be built.

Artisan, for $5.00.
Builders' Guide, for $2.00.

Also a car shop of the same size as above.

Woodward's Farm Homes, for $1.00.
Woodward's Graperies, for $1.00.

Sonoma Co.

It is an assured fact that a railroad to connect with the main line, *via* Petaluma and Napa, will be started very soon. Also a branch line from Santa Rosa to Sebastopol. Lots of supplies of all kinds will be needed for their construction.

South Riverside.

A prominent Minnesota capitalist intends to erect a two-story brick building to contain five stores.

San Jose.

Architect Page has let a contract to Mr. Piggotts for J. L. Reidy. Cost, $2,500.

At the fair grounds large additions are to be made for the use of racing horses. About $2,000 will be required.

Building Superintendence, for $3.00.
American Cottage Homes, for $3.00.

E. O. Smith is arranging for the erection of a handsome $6,000 residence on First Street, near the railroad depot.

Lumberman's Hand-Book, for $2.00.
Practical Geometry, for $1.00.

Capt. J. C. Morrell is having plans prepared for an eight-room dwelling on Fourteenth Street.

Builders' Companion, for $1.50.
Builders' Work, for $5.00.

A site for a fire-proof Hall of Records for Santa Clara County has been selected in San Jose.

San Diego.

A $15,000 brick building is under advisement for the use of the Grand Army Post, G. A. R.

Seattle, W. T.

J. Morris Haller has commenced excavating, preparatory to the erection of a block of buildings.

Practical Perspective, for $5.00.
Woodward's Country Homes, for $1.50.

Ventura.

On the tapis a $50,000 hotel, a large brick block, and a $15,000 dwelling for L. J. Rose.

Practical Perspective, for $5.00.
Woodward's Country Homes, for $1.50.

Watsonville.

A new saw-mill will be erected near this place.

Mural Painting (new), for $3.00.
Home Hand-Book, for $10.00.

Yaquina, Or.

A brick railroad depot will be erected at this place.

Architecture and Building, for $3.50.
American Cottage Building, for $3.50.

Yamhill, Or.

A two-story building for the use of the I. O. O. F., is contemplated.

Plaster, How to Make It, for $1.00.
Shavings and Sawdust, for $1.50.

SAN FRANCISCO, CAL., MAY 15, 1887.

The Sewerage of San Francisco.

THE presence of Mr. Waring, a gentleman of national, if not world-wide, reputation as a thorough scientist upon all sewer questions, is a welcome guest in our city, and it is hoped that his extensive experience and knowledge in and of the subject matter, will enable him to suggest remedies for the foul and health-destroying condition of the sewers of San Francisco. That they are such, no one conversant with facts will question. That the lives of thousands, nay, tens of thousands, of human beings in this city, both old and young, have been jeopardized or sacrificed by sewer agencies, is beyond reasonable doubt, and enormous sums of money have been consumed in building those conduits intended to protect life and health, but which only in part perform the purposes for which they were and are so intended.

Mr. Waring will find in the course of his investigations, that nature had provided a site for a city, as far as drainage is concerned, surpassed but by few on earth, with hills and high grounds at its back and center, and abundant surplus material to fill all low places to make perfect the inclines to the bay. He will also find that a grave mistake was made by those who established the grades in the early days of the city, even if the eastern boundaries had been extended no farther than Front Street, which at one time was supposed would be the water front. Had this remained as the limit of extent eastward, then the grade should have been uniform from Kearny Street, which would have added some fifteen feet to the fall from that point. Another mistake was made in fixing *base* at the low altitude of $6\frac{7}{10}$ feet, as that figure necessarily forces the sewer outlets below the tides, so that at times the waters of the bay form a liquid embankment against the outgo of solid matters, and change of tide had and has to be relied upon to clear the sewers. Had the water front remained a permanent fixture at Front Street, the sewer difficulties would have been less. But when eastward the city front sped its way, several blocks beyond the first intended point, no remedy for level sewers existed, except to raise all the streets and buildings west of Front Street. This not being resorted to, the only thing remaining to be done was to extend the sewer at base level to the outlet.

Mr. Waring will also find this material fact to overcome, viz., a thousand feet of dead-level sewerage at the east front of the city, and much more at the south front to overcome. Again, the present 3x5 feet sewers are at times insufficient to free themselves from the great rush of water passing through them—so much so, that south of Market Street, in places, the water forces its way up through the man-holes and floods the streets. If all this can be met and successfully overcome by Mr. Waring, he will have done a most excellent thing for the city of San Francisco. Until he shall have more fully developed and made public his recommendations, nothing can be said favoring or disapproving his propositions. But we may with confidence expect some very practical and feasible suggestions from him.

Will Present Prosperities Continue.

QUESTIONS as to the permanency of the great and widespread prosperities which have developed throughout the length and breadth of California, and the Pacific States and Territories generally, during the past few, and especially the last three years, lead some to feel that it is too good a condition of things to endure for any great length of time, and timidity and fear begets doubts and misgivings, and these corrode what little of progressive vitality they may possess, rendering inert and dormant energies which, if properly exercised, would bring personal compensation, and at the same time assist in stimulating others to safe ventures and undertakings, which, otherwise, might continue undeveloped for long periods of time.

Nothing so demoralizes the common interest of communities, as the lack of enterprise among the people composing the commonwealth. One sterling, active, wide-awake citizen, with scarce a dollar to his name, is worth more to any city or State than a thousand grasping, hoarding, centralizing, purse-bound, avaricious men, whose idol—god—is accumulated possession and personal wealth. The one as compared with the other, is as the showers and zephyrs of spring to the parching heat of mid-summer, or the chilling blasts of winter's storms. California has been too abundantly cursed with the latter class, and as a consequence the general interests of the State have been held in check, and thousands of possibilities which are at the present time so apparent, have remained unapplied and practically worthless during more than a generation of human life.

Perhaps the time lost was necessary to ripen and mature the present and recent past state of things, and make clear and plain how great and goodly a strip of land lies along the Pacific Coast, as part of the domain of free America. And now that people from all sections of the Union and from foreign countries, as well as ourselves, are made to realize the inherent values and greatness of the Pacific States, why should it be feared that we, as a people, cannot continue advancing and prospering, with never more than the occasional, periodical, temporary death in commercial, producing, manufacturing, and mechanical life, which at times comes to the most favored and prosperous people.

If present prosperities were the result of some uncertain thing, worked up and stimulated by various unreal, spasmodic, speculative games, controlled by combinations with a mere stock and chance prospect, then fears might be justified. But the fact that the present beautiful outlook is the result of permanent investments in lands and business pursuits and productions, and things necessary to human life and happiness, there can be but one conclusion reasonably drawn—that permanent, present, and still greater future prosperities are fully assured, and that those who doubt the stability of present things, do so more from personal, mental, and business deficiencies, than from any indications sustained by good judgment or apparent probabilities.

CARPENTERS' STEEL SQUARE AND ITS USES. PRICE $1.00.

The Elevator Shaft.

AMONG the modern improvements in building, the elevator justly holds a leading place. High buildings, whether used for business or as habitations, are rendered far more convenient and enjoyable when the labor of climbing stairs is reduced to the lowest possible degree. The lofty hotel is no longer dreaded by the traveler, for he knows that if he is assigned to a room even on the sixth floor he will not have to take up a weary march over a bewildering variety of passages and stairways.

The elevator is on call at any time, and it speedily lands the economical guest on the sky floor, which, by the way, is the pleasantest part of the house in a large city. But this indispensable comfort introduces a most dangerous companion, namely, the shaft or space in which it must work. The shaft being boxed in, produces a flue, which, unlike many chimneys, never fails to possess a good draft.

By it the old subdivision by floors is broken, and according to the size of the elevator, the whole building is united. The floor of the elevator must act as the temporary one for all above the upper one, and as it can be at but one place at a time, the shaft or flue is always open at some place.

A fire occurring on any floor and burning its way to the elevator is almost instantly past control, and carries terror to the upper stories, which otherwise would have been unharmed, or, at least, there would have been sufficient time allowed for the inmates to have retreated somewhat orderly by the stairways, instead of instantly being confronted by roaring flames and suffocating smoke.

Now, the wonder is that there are so few elevators arranged to cut off a fire and confine it to the story in which it originated.

The daily papers frequently give the particulars of large fires which would have caused but trifling loss if the elevator shaft had been closed.

The report often shows that a small fire started on the lower floor, but on reaching the elevator it was in a twinkling spread to the upper floors. The space acts as a most unmerciful blower for the flames, and the frequent loss of life caused by it leads many to dread its presence and to wish for the old style. In some of our business houses there are doors at each floor which open and close automatically, and this seems to be the only safeguard that can be introduced, and if it is possible to have a similar arrangement in hotels it is passing strange that they have not been introduced.

Quite recently the Temple Theater and Egyptian Museum of Philadelphia, was totally destroyed by fire, which originated in the lower part of the building, said to be fireproof. The flames at first were not alarming, but the friendly elevator was near at hand, and the fire, having got within its suck, it at once mounted to the top of the building and in a few hours the huge and costly building and its contents were a mass of ruins. Two women in the upper floors were saved by the bravery of the firemen, who reached them by means of an extension ladder, otherwise there was no means of escape.

Two firemen were killed by falling walls, and the elevator shaft may be justly chargeable with their death and the loss of the building, as otherwise the flames might have been confined to the story in which they started. There was a wealth of ornamental work in the building, a small portion of the cost of which might have been profitably spent to render the elevator space something more than a flame-feeder and death-trap. Carriage factories with the elevator within the building are nursing the same evil; but as the space has to be quite large it would be difficult to guard every story by trap-doors. The place for the elevator is on the outer wall of the building.

The practice is common among all to place their chief dependence on a night watchman, whose duty it is to keep up a tramp, tramp over the premises and be ready to repel robbers or quench incipient fires. This worthy guard of the building is too often selected from among old men who are too much broken to follow hard work during the day, but who still have enough vitality left to walk leisurely over the building and keep an eye open against enemies of every kind. This man is supposed to be able to stamp out a fire, or to throttle a robber, but somehow or other he is always at the wrong part of the building to do either. Should a fire originate on the top floor, he happens to be promenading the cellar; and should the flames burst forth in the engine-room, he will most likely be looking out of the scuttle-hole in the roof. He is seldom in the right place at the right time, and is very rarely in the position or temper to check an incipient fire, no matter what appliances are at hand.

Extinguishers and interior water plugs are forgotten, or reported as being out of order, but *he* always manages to escape unharmed.

Manufactories wherein a large number of hands are employed should be under proper discipline to be able to quench a fire before it can gain great headway, providing that the fire occurs during work hours. But not one out of a hundred is under such discipline, and when a vicious flame bursts forth there is a pell-mell rush to get out of the building, instead of a disciplined few in each department who are ready to face danger by fighting the fire. The employes of the Columbus Buggy Company recently gave another exhibition of their valor under the appalling fear caused by a supposed earthquake, but which proved to be an explosion and fire within the vast building.

In two minutes after they were made aware of the true cause of the shock, the workmen had several streams of water playing on the fire and adjoining buildings, thereby preventing a great fire.

In a building, or buildings, so efficiently guarded the open elevator shaft might not be such a dangerous auxiliary to a small fire, but if by any means it should get a slight advantage the possibilities are that it would gain the mastery, not only over the shop brigade, but the combined force of the city fire department, as was the case with the Temple Theater, in Philadelphia.—*Painters' Magazine.*

Self-Evident Facts.

THAT this Journal is at present prospering equal to any period since its first issue; that—its advertising columns in evidence—business men find it the best medium for advertising, and for that reason we are crowded for space to accommodate new patrons. It is *the* medium through which those dealing in manufacturing, or producing anything used in the construction, equipment, or furnishing of buildings, can most successfully reach owners and those requiring things in the building line.

CONTRACTORS, ATTENTION!

For $5.00 we will insert your business card for one year, and send you this Journal, free.

Building Summary for May.

Our record shows that during the past month there have been commenced—

73 frame buildings, value	$376,700
6 brick " "	232,000
9 additions and alterations	84,100
88 buildings, value	$692,800

"Elastica."

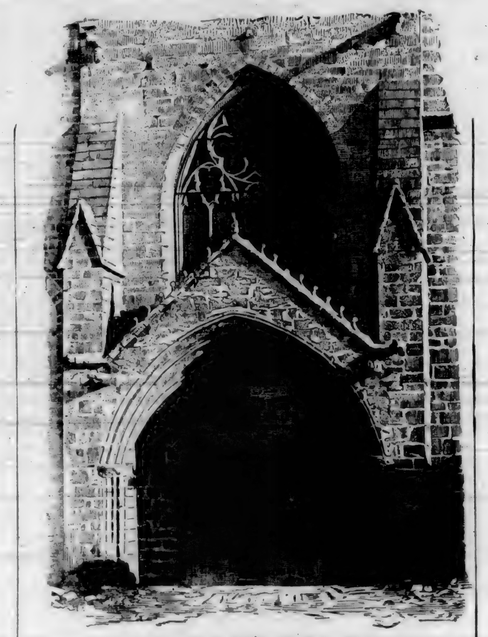
ARCHITECTS and owners have long desired to use an article on the finishes of houses, that would give a fine polish, and yet not scratch or mar white. In this one particular "Elastica" stands at the head of modern preparations. Scratched with the nail or other hard substance, there will be no visible effect, and absolutely none of the white scratches so noticeable with many other compounds. "Elastica" possesses in the highest degree great resisting powers to atmospheric influences, action of water, and alkali. The manufacturer, Mr. Rosenberg, personally called at our office, and demonstrated the superiority of "Elastica." It is kept by all of our principal dealers in paints, etc. Those living away from our large cities can receive information direct from Rosenberg & Sons, 207 Avenue D, New York City.

"Architect, Builder, and Mechanic."

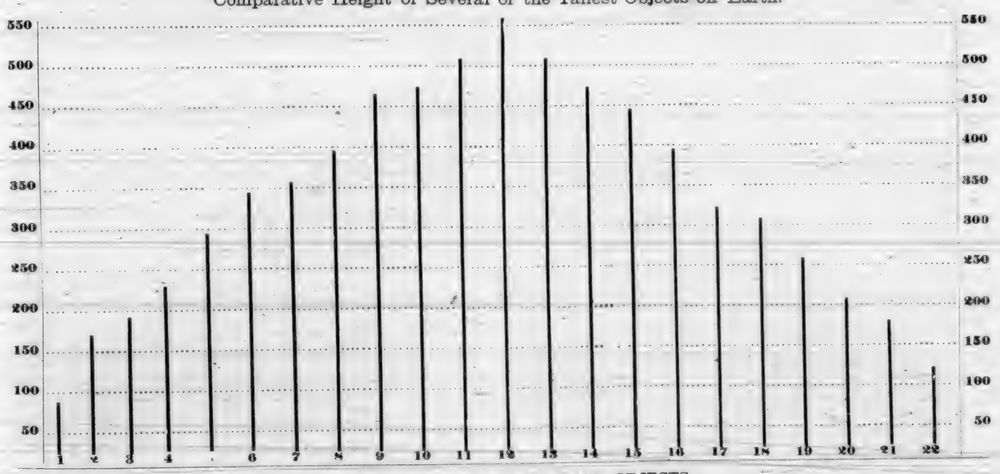
THIS is the title of a new journal published in Los Angeles, California. It gives promise of becoming a valuable aid to those in its particular line. Published semi-monthly, at the rate of $1.00 per year. Address, A. Willhartitz, 7½ North Main Street, Los Angeles.

See that two nails are put in each shingle if you want a good, tight roof. Redwood or cedar shingles are the best and last the longest. Dip shingles in lime water to make them lasting.

The proper height for the base-board of a room is one inch to every foot of height.



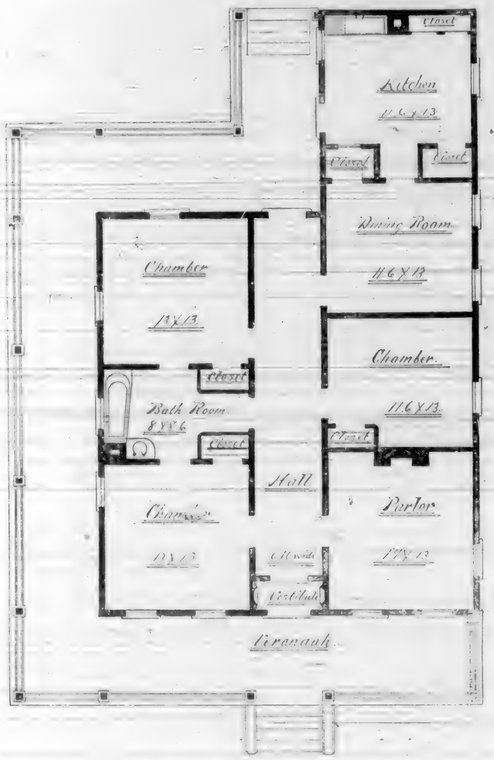
Comparative Height of Several of the Tallest Objects on Earth.



DESCRIPTION OF VARIOUS TALL OBJECTS.

1. Pompey's Pillar, near Alexandria, Egypt, 94 feet.
2. Niagara Falls, New York and Canada, 164 feet.
3. Cathedral (Minster) at York, England, 198 feet.
4. Bunker Hill Monument, near Boston, Mass., 221 feet.
5. Capitol at Washington, D. C., 287½ feet.
6. Bartholdi's Statute of Liberty Enlightening the World, 341.
7. St. Paul's Cathedral, London, England, 360 feet.
8. Cathedral at Antwerp, Belgium, 403 feet.
9. Great Pyramid at Gheezeh, in Egypt, 460 feet.
10. Notre Dame Cathedral at Rouen, France, 470 feet.
11. Cathedral at Cologne, Germany, 510 feet.
12. Washington Monument, Washington, D. C., 555 feet.
13. Old St. Paul's Church, London, England 508 feet.
14. Cathedral at Strasburg, Germany, 468 feet.
15. St. Peter's Church at Rome, Italy, 448 feet.
16. Cathedral at Freiberg, Germany, 385 feet.
17. Board of Trade Edifice, Chicago, Ill., 320 feet.
18. Big Trees, Calaveras Co., California, 300 to 330 feet.
19. Central Spire of Cathedral, Lichfield, England, 250 feet.
20. The Monument, London, England, 202 feet.
21. The Albert Memorial Monument, London, England, 180 feet.
22. Temple of the Sun, Cuzco, Peru, S. A., 120 feet.

—*Hills' National Builder.*



Plan for a Country Dwelling.

THE above plan possesses many qualifications necessary for a convenient country home. The arrangement especially recommends itself to the consideration of those living in our warm valleys. There is a direct ventilation through the house, by means of the hall; the kitchen is conveniently placed so that, if found necessary, the table can be set on the veranda. As shown, there are no extra finishes, the design being to represent a convenient arrangement, at a low cost. If necessary, the veranda can be continued all around the house.

Practical Ideas for Builders.

IN building a house there are many things which the builder might suggest to the owner as a convenience that he might not otherwise think of. I find in my business that I am often called upon for advice, and have therefore carefully posted myself on such points as will be of the most service to my patrons. Quite often I have had parties come to me to secure my services in building a house, and not being able to employ an architect, relied upon me for advice in many of the details, and were I not posted in these things I should be at a loss how to answer. If you think your readers will not look upon me as egotistical, I will give a few hints, which no doubt every carpenter knows but does not think of putting to use.

First, then, I never advise my customers to have winding stairs. They are regular men-traps, and nothing large can be carried up or down without knocking off plastering or hurting someone. Straight, continuous stairways cause draughts and loss of heat, and if a child starts to fall at the top it never stops until it falls the whole length. My idea is to have flat landings and right-angled turns. These give a fine effect and are artistic and fashionable. I generally put in a light wall strip of beaded work to protect the plaster while trunks or furniture are being carried up or down. If I can so arrange it in the plans I advise a back stairway, as this is one of the most convenient and useful adjuncts to a dwelling. Stairs should not have over seven-inch raisers, and six-inch would be better. I never plan to have a fire-place come between windows if it is possible to have it in the blank wall. Open fire-places should be as wide as possible. Great depth is no advantage; in fact, it prevents the warming of those parts of the room on each side of the fire-place. If there is any tendency to chimneys not drawing, or drawing the wrong way, there should be a whirling cowl, or else a triangular hood of brick or flat stone.

The flues should have large man-holes in them, in the attic, so that large openings can be made in them to draw off hot air in summer. These holes may be covered with sheet iron in winter. I made my attic cool and comfortable by this means, after a servant had given me warning that the upper room was too hot to live in.

A bay-window is not a very expensive thing, all considered, and it sometimes makes a room just commodious and pretty which otherwise would have been cramped and ugly. It gives a good chance to decorate; you can put a lambrequin or curtain across it, and seats in it, and busts at the side, and plants at the back, and a bird cage in the arch, and a fancy stand in the middle; or you can put sash across it and make a little conservatory of it. It is a good place to work or loaf in. While I do not believe in making a house look as though it had been vaccinated for bay-windows, and had taken splendidly, one or two often redeem an otherwise thoroughly ugly, unhomelike and inconvenient house.

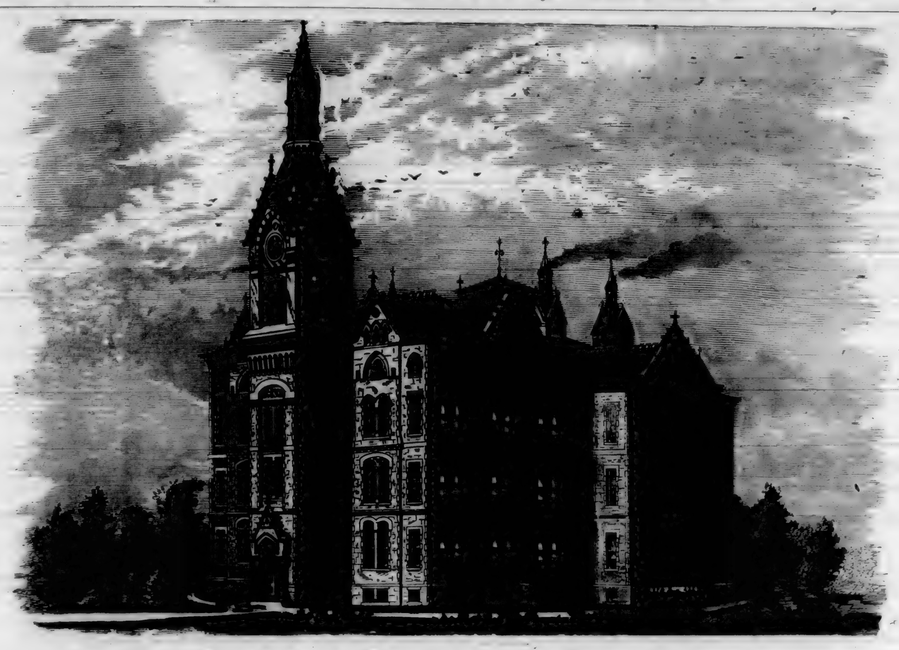
I have a few more little hints that I will try to give in a future article if your readers find this acceptable.—*J. C. G., in American Builder.*

White Efflorescence on Walls.

MANY untenable theories have been propounded relative to the efflorescence frequently breaking out on walls, and causing much annoyance to the painter where there have been given coats of color by the defacement that ensues. Should the various saline particles in a dequitescent state which lead to its formation have found lodgment in the walls of a building, they will assert themselves exteriorly unless the pores of the wall be hermetically sealed. The efflorescence is caused by the fixed alkalies, potash and soda, crystallizing on the surface of the wall. This unsightly efflorescence will totally or partially appear and disappear from time to time. The conditions under which this occurs are worthy of note. The changes are found to correspond closely with changes of temperature and of dryness and humidity of the atmosphere. The ordinary mode for reducing the efflorescence when it makes its appearance, is roughly to brush off the crystals, but what is wanted is their absolute prevention. The potash in the bricks, the true germinating cause, owes its existence to the putrefaction of animal and vegetable substances in the clay out of which the bricks are made. The potash on making its way to the surface absorbs nitrogen from the atmosphere, and thus nitrate of potash, or saltpetre, is produced. Some dampness, however, in the bricks, such even as may be occasioned by rain, is necessary to bring out the potash, evaporation from internal or external heat following on, the existing dampness being the means of exudation. The efflorescence is gradually formed, and after it has become sufficiently thick it is crystallized by the nitrogen of the atmosphere, and is at once rendered visible. The molecules come out under the influence, as we have stated, of successive weak solutions of potash and dampness, and when the successive depositions of this watery solution are sufficiently strong, crystallization follows. Evaporation is thus essential to the production of the efflorescence, and could evaporation be prevented it would cease. The eminent French chemists, MM. Thenard and D'Artel, have shown that the best way of preventing the access of any damp from the bricks, or preventing any damp that may have found lodgment exuding, is to lay on the surface a preparation of wax and lithargerized oil. This is so effective in closing the minutest pores that even when applied to stucco that has afterwards been painted in oil colors, the composition is found to have penetrated so deeply and had such a hardening influence that no infiltration of water from wall or roof could have any effect. The preparation is equally applicable to wood, which, when saturated with it, will not permit of the exudation of damp.—*Painter's Magazine.*

Modern Cottages.

BY J. H. Kirby. This new work contains 125 illustrations of cottages, dwellings, and miscellaneous work. The cuts illustrating the work are of more than ordinary merit. The author devotes considerable space to "Hints on the Practical Construction of Dwelling Houses." This work will recommend itself to the consideration of those desiring a well-planned house. Copies may be obtained at this office.



Design for a High School Building to be Built of Stone.

Worth Thinking About.

DO you think, because you are a mechanic, blacksmith, or moulder, that it is necessary to carry the marks of your trade on your clothes when your day's work is done? Is there anything particularly edifying to the friends you meet in the streets, male and female, in the sight of dirt-begrimed clothes and skin? We do not believe that there is, and we do not believe that any persons ever yet advanced their interests by neglecting to keep themselves tidy. Let the mechanic who has been in the habit of carrying his "trade-mark" about with him wherever he goes—taking a general pride in his general untidiness—just stop and think, and run over in his mind the list of his fellow-workmen who have been, as he thinks, especially fortunate in securing promotions and better positions; and if his memory serve him rightly, he will remember that those were the chaps who were always neat about their persons, and who used to be so particular in taking care of their tools never caring to lend them. These were the men who used to be dubbed "old women," "fads," etc.; they are now the men who have won positions for themselves and know how to maintain them. It does not make a man any the worse mechanic for being neat in his person; and, argue as you will, the world as it goes has a greater respect for a clean mechanic than it has for a dirty one.

How to Mark Tools.

MUCH trouble can often be saved by marking tools with their owner's name, which can easily be done in the following manner: Coat over the tools a thin layer of wax or hard tallow, by first warming the steel and rubbing on the wax warm, until it flows, and let it cool. When hard, mark your name through the wax with a graver, and apply aqua-fortis (nitric acid); after a few moments, wash off the acid thoroughly with water, warm the metal enough to melt the wax, and wipe it off with a soft rag. The letters will be found etched into the steel.

THE measuring of a candle power of a light is accomplished by comparing the shadow cast by a rod in the light of a standard candle with the shadow cast by the light to be tested. By moving the latter toward or away from the rod, a point will be reached at which the shadow cast by both lights will be of the same intensity. The intensity of the two lights is directly proportional to the squares of their distances from the shadow, *i. e.*, suppose the light to be tested is three times the distance of the candle, its illuminating power is nine times as great.

Large Trees.

THE following extract is going the rounds of the press and will serve to show the ideas of some people as to the size of our trees:—

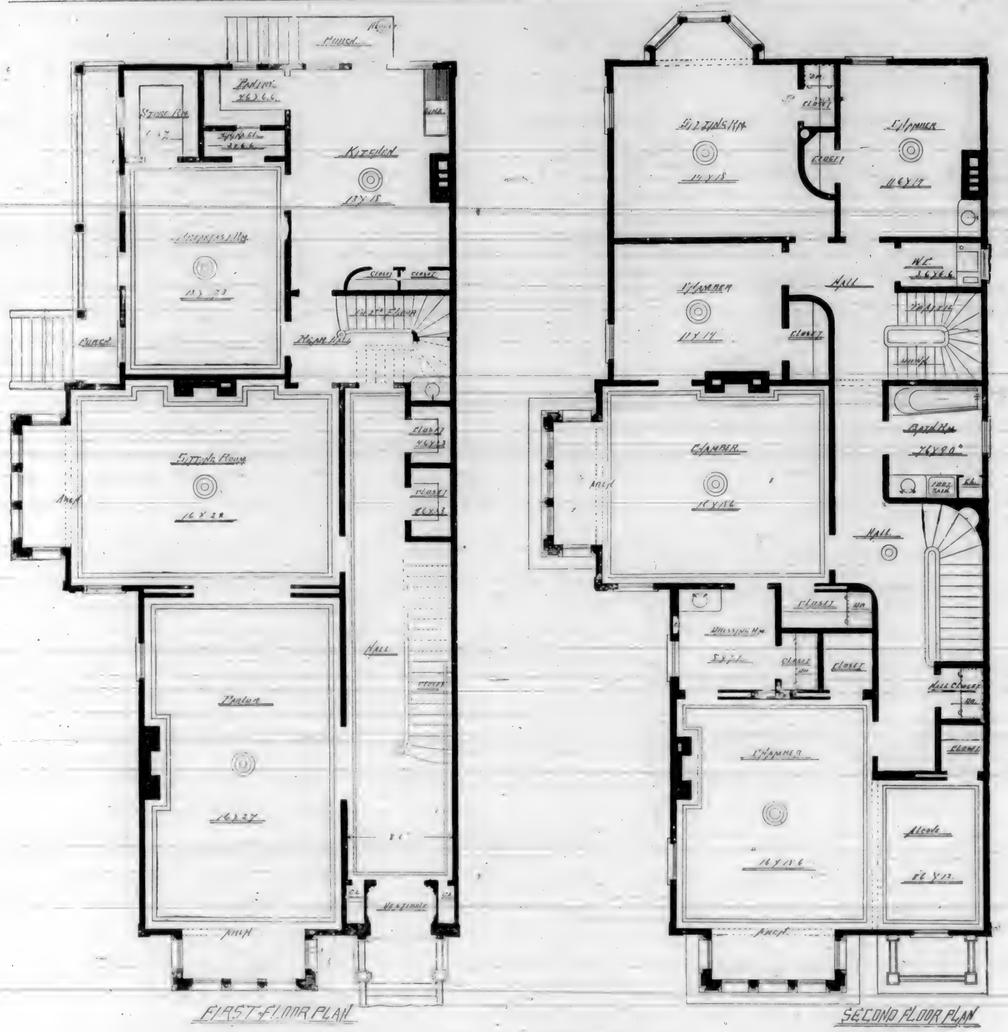
"So you have been out in' California?" I inquired of old Dan Whiting, the other day. "See anything of those big trees that we read so much about?"

"Wall, I ruther guess, yes," said Dan. "Saw a holler tree there you could drive a team of horses through. One afternoon me and Sam Washburn, we started to chop down the biggest durn tree you ever see. We are pretty slick wood-choppers, us two, but we worked like beavers at that there tree for nigh onto two weeks. All day long fur fourteen days we kept a-choppin', and Sam he kinder felt like givin' th' thing up as a bad job, but I coaxed him, and told him it wudn't take more'n anuther week to get through the tree, but I lied like thunder. Anyway, we went to work on th' fifteenth day as usual. 'Long 'bout ten o'clock I got pretty tired, and stopped a bit to rest. While I stood there leanin' on my axe handle, a big chip came a-flyin' from around the tree and took me straight in th' face. It was sort of funny proceedin', so I jest took a walk and looked onto th' other side o' th' tree, and there b'gosh what 'spose I found? There were two big fellers, both old wood-choppers, a-workin' away with their axes on th' other side of our tree. I said, 'Howdy,' and they stopped work. Them two duffers had been choppin' away thar on our tree fur nigh two months, and were only half through!

"They do have good-sized trees out thar, stranger, that's a fact."

DEATH UNDER THE HOUSE.—Death lurks under the house in early spring, in the shape of decaying and moldy vegetables in the cellar, and the decomposing remains of weeds and fungi which developed the preceding season in the damp, dark, unventilated space beneath that portion of the house not included in the cellar. Killed by the winter's frost, this decomposable matter is ready to send forth the pestiferous gases and disease-producing germs which cause some of the common maladies incident to spring. Clear away the filth from these oft-neglected places, and save suffering and doctors' bills.

A MANUFACTURER out West informs us, and wishes to inform the American public, that his patent buzz saw has just captured the finger of scorn, and that it will never again be pointed at anyone.—*Puck.*



Plans for a Commodious City Dwelling.

Plans for a Commodious City Dwelling.

THE plans shown are well worthy the attention of those seeking a comfortable city residence. Sizes of rooms are distinctly marked. Any information in regard to the plan will be furnished inquirers by addressing this office.

Folding Gates and Guards.

A PERFECT SECURITY AGAINST THIEVES AND TRAMPS.

THE perfect and beautiful device, as fully illustrated on page vii of this issue, recommends itself at once to the careful consideration of those who would have their stores and homes perfectly secure against tramps and thieves. These gates and guards are manufactured to order in San Francisco, to fit and fill any desired opening. They are ornamental in design, and apply equally as well to store windows, vestibules, stables, elevator wells, etc.

As a sanitary device they are superb, permitting the opening of doors and windows, and the free circulation of air through buildings.

Full information in regard to the above can be obtained by applying either personally or by letter to E. J. Robinson, Manager, 109 California St., San Francisco, or to the Secretary of the Company, J. P. Le Count.

IT seems that a lawyer is something of a carpenter. He can file a bill, split a hair, chop logic, dovetail an argument, make an entry, get up a case, frame an indictment, empanel a jury, put them in a box, nail a witness, hammer a judge, bore a court and chisel a client.—*Exchange.* Furthermore, he can saw the air, jamb the books down, cut up a witness, screw money out of the victim, floor an opponent, spout nonsense, shelve an enemy, lumber up his speech with Latin, set men at loggerheads, veneer a falsehood with plausibility, rip up the code, ex-plane knotty points, varnish a story, plank down solid law, board his bill out, table an object, pigeon-hole a case, mould the opinion of a juror, paint the other side blacker than it is, polish off another lawyer, post an ignorant witness, prop up a bad argument, and plaster a judge all over with taffy.

WE note an unusual number of patents for stove-pipe dampers. Dampers don't amount to much. What is wanted is a device that will make every end of every length smaller than any other end of any other length.—*Machinist.*

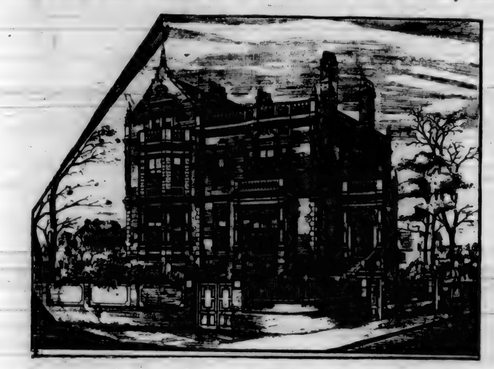
Dwelling Houses.

THE increasing interest in the subject of architecture shown by the daily press is the most promising sign that we as a nation are progressing in art development. In a word to our exchanges, we urged in our last issue that editors of newspapers give more attention to architecture, and to sanitary and



safe construction, not, however, overlooking the æsthetical side of the subject, which, of necessity, is of slower growth than the more practical features to which special attention was called. We are pleased to republish an editorial which appeared recently in the Des Moines *Leader*. The subject, "Dwelling Houses," is one in which the people are interested, and the writer handles his subject well. He says:—

"Few people realize how great is the public importance of the study of style in buildings. With it a community or country may be made permanently beautiful, or for the want of it eternally disfigured. We do not wish to ride any hobby and follow out the train of thought to the question of the good and evil effects of to-day's architecture on the minds and morals of to-morrow's 'rising generation.' Running everything into morals and religion is as bad as running it into politics. Beauty and business will suffice for present considerations. We all know that a town or county characterized by pretty houses is all the prettier for it, and especially in the case of the town, will profit by it in a business way and in its own upbuilding.

"Hence we can hardly say too much, if what we say is right and true, about style in building houses. Not that we ought to look out and always be 'stylish.' As a rule stylish people are those who know the least about style. 'The highest art is to conceal all art.' And this leads us to the particular subject of our homily.

"Last fall we called attention to the fact that the light and flimsy in architecture was passing away, and the heavy and substantial was taking its place. This movement has developed into real and rapid revolution. It almost takes one's breath. We expected that something about as heavy as the old Greek styles would be reached before long. But already they have been left away behind.

"Nothing will ever be prettier than the Greek. But one forgotten consideration must be recalled and kept constantly in mind. The Greek styles which we admire were all public building styles. In fact, they were temple styles. We cannot adopt them in our temples, because our temples are fixedly Gothic. We may and do adopt them in our other public buildings, and there they look pretty. But even in Athens it was against the law to finish private dwellings in the high styles of architecture.

"You cannot make a Greek porch fit nicely on a modern residence. You may get a certain very pretty effect, but still it is not the effect you want. Ink looks pretty on paper but not on the baby's face, no matter how artistically it is applied.

"It is not because the Greek is too heavy. It is as light as wicker beside the dwelling styles we have. The column has developed into a great pillar of stone or brick, arched perhaps to its neighboring pillar. The balustrade is a brick or stone wall. The roof of the porch is a continuation of the roof of the house, from which the gable cornice is gone. Great heavy shutters swing from the outside of square, old-fashioned windows. The chimney is an immense pile, and looms up in grim prominence.

"Everything is as modest as it is heavy. There is no strutting, no boasting, no lowering. The house bows and invites, though it does not smile. It is not severe. It is substantial and hearty. We are afraid it is almost ugly. Its countenance is shaggy and solid as some kind-hearted old Scotchman's, or his whole-souled dog's.

"And yet, after all, there is a beauty in it. Of course we have described the extreme, and it is an extreme from which there is likely to be a recession. Fortunately we are likely to have mingled together the extremes in both directions, and a great variety of means between them. After all, variety is the spice of life. Even the extremes may be so proportioned and toned that the art in them will be concealed.

"We speak of these things because the building season is on, and our architects, builders, and home seekers need to be looking out for these things. Our advice to all is the same as it has been,—not to be caught with a style which is so much in the fashion to-day that it will be antiquated to-morrow. Build a house that will always look pretty, no matter how much fashions may change. But it is profitable and possible in a house, which lasts long and is always for sale.

"Of course the very heavy is most appropriate to stone and least to wood, brick coming in between. But porch, and modesty, and cordiality, and substantiality are proper and will be durable in all. And as to the weight it depends on where it appears. Let it be remembered that we are building for a generation which will have more sense and better taste, and be able to detect at a glance these things which we can't appreciate until we have studied them. And the more money you put into a house, and the more lasting you build it, the more careful you must be to make it please that coming generation. Let us see if we can do as well in our dwellings as the Greeks did in their temples—challenge the admiration of 2,000 years to come.

"But then we don't need to do that. Our climate would long since have destroyed the Greek masterpieces, as it is crumbling the Obelisk. Still times and tastes, as well as weather, change more rapidly here than in the Orient."

PRELIMINARY ANNOUNCEMENT.

Twenty-Second Industrial Exhibition

Mechanics' Institute of San Francisco.

THE Board of Trustees of the MECHANICS' INSTITUTE take pleasure in announcing that the TWENTY-SECOND INDUSTRIAL EXPOSITION of the Society will open in its spacious Exhibition Building, bounded by Larkin, Hayes, Polk and Grove Streets, on **Thursday, September 1st, 1887,** and will close on **Saturday Evening, October 8th, 1887,** thus keeping open continuously to the public for the period of one month and eight days.

The great popularity of these exhibitions in the past is the best guarantee of their merit, and of their usefulness in the future, and it may be truly said, that their profit to the exhibitor is in equal measure to their instruction to the visitor.

No better means of advertising useful articles can be conceived than a daily opportunity, under pleasant circumstances, and in the midst of a vast and orderly crowd of inquiring people, of personally displaying and explaining the merits of one's inventions and productions.

The Exhibition Building is complete in all its appointments.
No Charge is made to exhibitors for space.
Steam power and **water** furnished **free.**
In addition to gas, powerful electric lights will be used at night.

Arrangements are being made to secure art exhibits, pictures, statuary, etc., of unusual merit.

Engagements have already been entered into with leading manufacturers, which ensure an unusual exhibition of notable inventions, mining and other industrial machinery in actual operation, and a complete display of the finished products of our California workshops.

A Grand Orchestra of skilled musicians, including many specialists and solo performers from the East and Europe, giving Grand Concerts each afternoon and evening under the direction of the celebrate **Frederick N. Innes**, has been contracted for at great expense, and will make the coming Fair memorable in the musical annals of the State.

For space or any further information, apply at the **office of the Institute, No. 31 Post Street, S. F.**

FACTS

About the Manufacture and Relative Value of Roofing Plates, and about the Laying of a Good Roof.

MANUFACTURE.—Roofing Plates, which are made of either steel or iron, are coated with a mixture of lead and tin, by two methods. The original method was by dipping the crude iron or steel plates into a mixture of tin and lead and allowing the sheets to absorb all the metal coating that was possible, and it is by the same process that the "Gilbertson's Old Method" is made to-day. The other process, by which the majority of Roofing Plates are made, is known as the "Patent Roller Process," by which the plates are put into a bath of tin and lead, and are passed through rolls, the pressure of which leaves on the iron or steel a thickness of coating that determines the value of the Roofing Plate. These rolls can be so adjusted as to leave a good amount of coating on the plate, such as the "Camaret" has, or an ordinary coating, or a very scant one. Hence the *only actual difference* between the "Camaret" and the "Gilbertson's Old Method" is that the latter plate has the heavier coating of metal.

Misleading Terms.—There are at the present time certain brands of Roofing Plates in the market, styled "Double-Coated," "Re-Dipped," "Double-Dipped," etc., etc., all of which terms are, however, *incorrect and misleading*, as it is *impossible* for any plate to take more metal than adheres to it by the first dipping, if left in the bath of tin and lead a requisite length of time, and no plate can have its coating increased in thickness by being re-dipped.

Assorting.—The value of a plate does not entirely depend upon the material and coating, but upon the care used in assorting, or picking out the defective sheets from the good ones. There arise in the manufacture of all Roofing Plates, imperfect sheets, such as sheets with blisters, or with broken corners, etc., which are called "Wasters." These are packed by themselves, the IC plates being marked "ICW" and the IX plates "IXW." The perfect plates are designated by the manufacturers as "Primes," while the imperfect sheets are called "Wasters," and the latter are sold at considerably less than the Prime Plates.

Sizes.—There are two sizes of Roofing Plates made, 28″x20″ and 14″x20″. The larger size is mostly used, from the fact that it requires less seams on the roof, and consequently cheapens the cost of putting on. There is a size 10″x20″, now used for gutters and leader pipe.

Thicknesses.—There are only two thicknesses of Roofing Plates made,—IC or No. 29 gauge, which represents in weight 8 ounces to the square foot, and IX or No. 27 gauge, which equals in weight 10 ounces to the square foot.

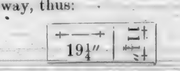
The IC plates are used to a far greater extent than the IX, from the fact that they are less expensive. For the very best roofs, however, IX Plates are preferable, the extra thickness being worth more than the extra cost.

Weights.—The old standard net weight per box IC 14x20 Roofing Plates was 112 lbs.—1 lb. per sheet—but this became reduced by competition and the desire for cheapness to 108 lbs., which is to-day the standard net weight. Indeed some tin plates are being brought out weighing very little more than 95 lbs. per box.

The standard weight of IX 14x20 Roofing Plates is 28 lbs. over that of IC 14x20, and 20x28 plates of course weigh just twice as much as 14x20.

Stamping.—Every sheet of the "Gilbertson's Old Method" and "Camaret" is now being stamped, not only with the name of the brand, but also the thickness—IC or IX; and as a further protection for these plates, every box of both brands contains a slip bearing our guarantee and the name of the assorter.

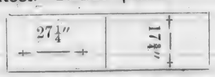
Laying the Roof.—14″x20″ plates. Many claim that a better roof can be made of 14x20 tin than 20x28. The cost of laying a roof of the smaller size will amount to 25 to 30 per cent. more than the cost of 20x28 size, owing to the greater number of seams, and hence more tin, solder, cleats, and work are necessary in laying. Locality has much to do with use of the two different sizes. The 14x20 tin can be laid in two ways. The most desirable way (and that which makes the best roof) is by laying the sheets the 14-inch way, thus:



In order to lay the tin this way more cleats are of course necessary than by laying the sheets of 14x20 the 20-inch way, as well as more solder, nails and labor.

The above represents the net surface when laid the 14-inch way.

Laying the Roof.—20″x28″ plates.



The above represents the net surface when laid the 20-inch way.

If two roofers figure to lay a roof of 20x28, and one lays it the 20-inch way, he cannot lay it as cheaply as the one who would lay it the 28 inch way, but at the same time he *can* make the *better roof*.

Advantages of Standing Seams.—Standing seams allow a greater amount of expansion and contraction than the flat seams, as the flat seams being soldered, make the entire roof practically a solid sheet.

For a steep roof the tin should be put on with a standing groove and with the cross seams put together with a double lock. A cheaper way is to double lock the seams and put white lead into the joints instead of soldering; but we would recommend that the cross seams be locked and well soldered.

Soldering.—We recommend the use of resin only as a flux in soldering, although some roofers use diluted chloride of zinc. "Half and Half" Solder (a mixture of half tin and half lead) is the mixture most suitable for roofing purposes.

Painting the Roof.—An excellent paint for the purpose is composed of 10 lbs. Venetian Red, 1 lb. Red Lead, 1 gallon Pure Linseed Oil.

The substitution of benzine or fish oils for the pure linseed oil should not be allowed.

The roof will last longer and be less liable to rust if painted on the under surface before laying. It is a good plan to put one or two layers of felt paper under the tin to serve as a cushion for same, and to deaden the noise made by the rain falling on the tin.

A year after the first coating the roof should be painted again, and then a good roof will only require painting once in four years.

A roof of first-class material well soldered and properly laid should last forty years.

Suggestions to Those Specifying Tin Roofing.—In the light of the facts herein stated, we would suggest to architects and others desiring the very best quality of tin roofing that when they specify "Gilbertson's Old Method," or "Camaret" guaranteed brands, they should insert the full name of the brand in the specification and should require that every sheet be stamped not only with the name of the brand but also the thickness IC or IX.

To Prevent Screws from Rusting.—It is well known that iron screws are very liable to rust, more especially when they are placed in damp situations. When they are employed to join parts of machinery, they often become so tightly fixed that they can only be withdrawn with considerable trouble, a fracture sometimes resulting. In order to avoid this inconvenience, screws are generally oiled before being put in their places, but this is found to be insufficient. According to the *Moniteur Industrielle*, mixture of oil and graphite will effectually prevent screws becoming fixed, and, moreover, protect them for years against rust. The mixture facilitates tightening up, is an excellent lubricant, and reduces the friction of the screw in its socket.

CONTRACTORS, ATTENTION!

For $5.00 we will insert your business card for one year, and send you this Journal free.

The "Universal Tinker and Amateur's Assistant."

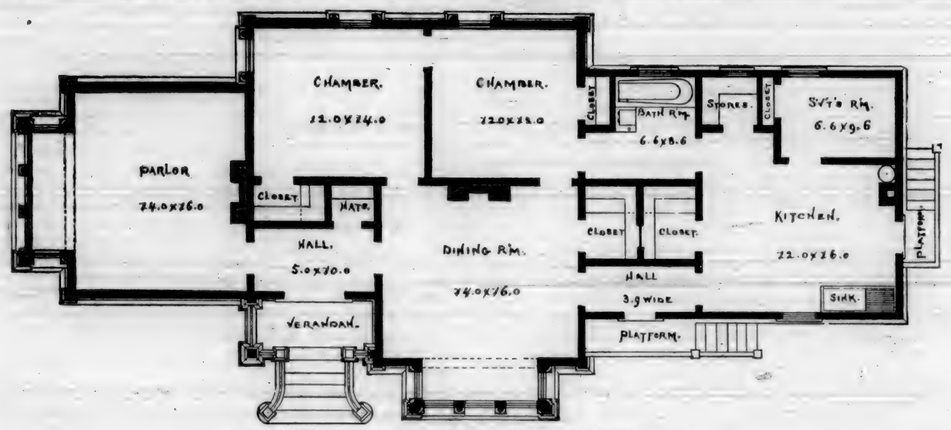
THIS is the title of a new monthly journal to be issued about the 1st of July, 1887.

The new journal is not intended to take the place of the valuable juvenile papers or magazines that are now so popular among our young folks; it is rather intended for young men and women than for boys and children. It will not be a "story-teller" unless the story told has a mechanical or scientific application. It will not be a "picture book," yet it will be illustrated with diagrams, designs and working drawings, and a sprinkling of illustrations of new tools, new amateur machines, new and old devices for doing work, and engravings of finished amateur effort.

The *Universal Tinker* will not confine itself to constructive work, but will take up every subject that may be brought before it and that may be dealt with from an amateur's standpoint.

It is intended at first to make it a sixteen-page journal, but may be enlarged or reduced as circumstances may warrant. The price will be $1.00 per year, payable in advance, but if at the end of the year we are encouraged to enlarge or further improve the *Universal Tinker* we shall increase the price to two or three dollars a year.

Any further information will be cheerfully furnished by addressing the proprietors, Hodgson & Bertrand, 294 Broadway, New York City, N. Y.



Plan for a Comfortable Country Dwelling

Plan for a Comfortable Country Dwelling.

THE above plan is very complete in all those little details that go to make a home in the country truly pleasant. Access to all the rooms is very conveniently arranged. The parlor is situated away from the living portion of the house. Every room is abundantly supplied with windows and closet room. The kitchen and its apartments will recommend themselves to the consideration of every thrifty housewife. Sizes of all the rooms are very distinctly marked.

Suggestions to Country Builders.

CHAS. HARDY, in the *National Builder*, says: Travel and intimate observation in the States of Illinois and Missouri reveal the fact that very few carpenters and contractors have made much pecuniary headway. Indeed it would hardly be erroneous to state that for the amount of business done few branches of trade have less profit to show.

The cause of this is probably to be found in the fact that, although nominally wages appear to be satisfactory, yet the average reduced by the inevitable interruption to work that the winter season brings with it, during which any small surplus is consumed. Contracts too, are of short duration, and especially in the smaller cities the interval between two contracts is a long one. A system of letting contracts by bids or competition, however fair it may be in theory, still works very unjustly where many of the bidders make no accurate, thorough and itemized estimate. It is common, extremely common, to hear a country bidder say that his employes have earned more than himself on a job, or had he to pay wages he would have been money out of pocket at its completion; and that to avoid this, he had worked it out himself alone, at a remuneration which left him only starvation wages or even worse. This is of course not intentional.

Very few indeed have any system which enables them to see day by day what is the result that a given job is showing. At the best this is discovered at the end of the season. It is no wonder that they underestimate, for underestimation is the natural consequence of overeagerness to obtain a contract, unchecked by a thorough and accurate fore-estimate of the result.

Underestimating means working for nothing and forcing others to do the same; it means impoverishment and poor work. The contractor has himself and his family to maintain, and the temptation is great to get out by doing poor work. I would suggest that every contractor purchase an account book large enough to enter, line by line, upon a single page every item of his estimate, giving quantity, price and labor for each item. Let him leave opposite to this page a blank page, on which he may enter on the corresponding line opposite the actual amount purchased, and the actual amount paid, together with the actual amount of labor expended upon the item, and he will thus be able to see the result of his contract.

Were such a system adopted it would never be abandoned. An estimate, if clear and explicit, would be gone over twenty times, with the result that the contractor would become expert in estimating, and a mistake once made would never be repeated.

There is an advantage in taking the items in a certain order and pre-erving that order. It is impossible to exaggerate the good effects of a system which enables the tradesman to know day by day exactly how he stands.

Every contractor has an interest in his competitor's knowing how to estimate correctly. It does not need many underestimators to ruin a business for a season.

Carpenters are far too apt to imagine that all that is wanted to make a successful contractor is to be a good mechanic. This is a great mistake. The country contractor should be a good business man, and have a constant clear insight into his business. His business is not like that of a merchant where he is constantly selling the same articles in small quantities at a steady pro t to the same customers. With the contractor each new contract is on a new basis, with a new customer in one large amount, composed of varying quantities, at various prices; and it is evident that it must require vastly more care and forethought to conduct his business successfully than one that is steadier. He is also entitled to a profit upon the labor he employs and pays for. He should also estimate the risk of damage to the building while in course of construction.

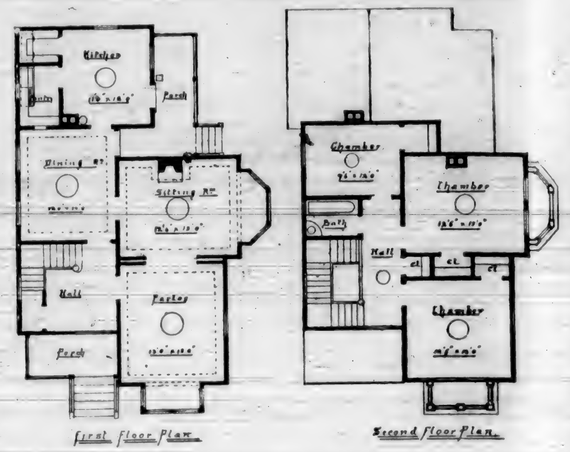
Prudence and wise precaution are not a waste of time and trouble, and if not exercised when called for, the consequence will assuredly have to be borne in loss and anxiety.

A coat of coach varnish will keep sap from striking through painted work.

CONTRACTORS, ATTENTION!

For $5.00 we will insert your business card for one year, and send you this Journal free.

Elevation.



A Country or Village Residence.

THE above engravings represent the floor plan and perspective view of a country or village residence, also suitable for the city, are beautiful in design, and illustrate the advantages and necessity of employing an architect, by their well-proportioned, neat and graceful elevations, and compact, convenient, and well-arranged plans.

This building was erected in Santa Cruz, Cal., furnishing a home for one of its most prominent citizens. In reality the building has a pleasing, graceful appearance, so desirable in villages or country homes. As you approach the building the heavy, projecting cornices and gables, with neat brackets, fancy shingling, and ornamental finials; the bay-windows with chamfered pilasters and carved brackets, surmounted by graceful and spacious balconies; the large porch with turned columns and balusters, and the front door with raised panels and ornamental glass transoms, etc., cause you to stop and admire the architecture before you enter. Upon entering the building you find yourself in a large hall with a beautiful flight of platform stairs leading to the second story, and inclosed by black walnut newels, railings, and balusters. On the right is a door communicating with the parlor, and in front, one with the dining-room. The parlor and sitting-room are separated by large, paneled, sliding doors, which can be thrown open, making a very large and beautiful apartment. In the center of the ceiling of the rooms are decorated center-pieces, and the parlor, sitting, and dining-rooms have moulded cornices of plaster of Paris.

The kitchen is provided with a large pantry, in which is a slide to pass dishes, food, etc., into the dining-room; it also has a large closet with shelves and drawers for linen, towels, etc.

The rear porch is inclosed by a neat railing, and for convenience a slop hopper is placed near the kitchen door.

This design is a most desirable one for any family wishing the conveniences and pleasures of a model home. Any information desired will be promptly forwarded by addressing David Salfield, architect, 216 Kearny Street, San Francisco, Cal.

Black Walnut.

BLACK walnut has been extensively used, the New York *Herald* remarks, in making furniture for nearly fifty years. The demand for it, however, is on the increase. The forests of the North have been pretty well cleared out, and now the Southerners are looking forward to a chance in the market. Tennessee and Arkansas lead the van. Black walnut timber has been cut in almost incredible quantities in both these States, and land-owners have reaped a rich harvest. Next comes the States further south. They have immense tracts of timber-land covered, not only with the walnut tree, but also with the best woods required in carriage building. It is suggested by the New Orleans *Picayune* that the time is not far distant when Northern capital will be invested in manufactories on the edge of Southern forests and the banks of Southern streams. To which the *Herald* replies: "Our neighbor may rest assured that if there is money in it Northern cash will meet Southern enterprise half way."—*Scientific American.*

AN exchange refers to it as a singular fact that bricklaying is one of the parts of skilled labor that invention has never interfered with. Bricks are laid one by one to-day as they were in Egypt and Babylon four thousand years ago. It might also have added that bricks are put into the hat in about the same way as in the time of Noah.

NEVER paint a kitchen floor—oil and stain it.

WHITE marble mantels are again coming into favor.

THE pressure of wind on a slanting roof is equal to twenty pounds to a square foot.

WHITE paint, white furniture, curtains, white walls, and white woodwork is the latest agony.

AN inch of well-haired mortar between floors will be found to effectually deafen them against sound.

TIN roofs should always be painted on the under side with mineral paint and be laid in single sheets, flat lock.

NEWLY plastered walls and newly laid shingles should not be painted for six months. Shrinkage will then be over.

SINKS for kitchens are now made of iron enameled, porcelain, soap-stone and crockery-ware; 20x40 is the best size.

CEMENT concrete four inches thick troweled down and finished with a coat of Portland cement makes the best cellar bottom.

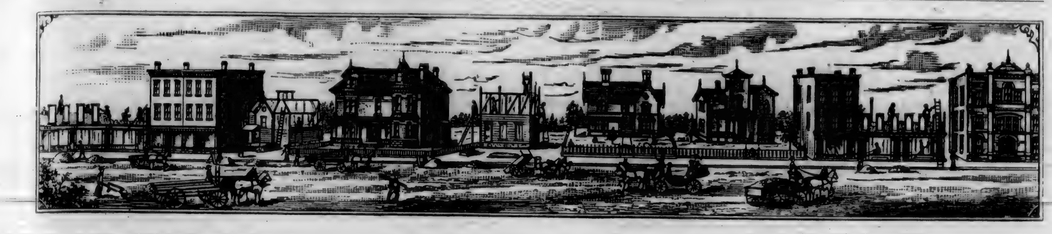
THE cause of many incipient fires is the faulty construction of chimney flues. Always see that they are thoroughly plastered inside.

THERE is no absolute need of painting zinc work, for exposing it to the atmosphere has the effect of coating it with a thick film of oxide which protects it from the future action of the air as effectually as paint.

A MIXTURE of cork, silica, and lime is coming into use in Germany as a building material. It has the advantage of keeping out heat and cold, and is also claimed to be an excellent preventive of dampness and deadener of sound. It is substantial, light, and durable, and seems to be especially adapted for ceiling and wall lining.

ARTISTIC TILES AND MANTELS.

ONE of the most artistic displays in Tiling, Mantels, Brass goods, etc., can be found in the rooms of E. A. Pattison & Co., 308 Stockton St., San Francisco. The design in tiling entitled "Cupid among the Roses," is worthy of particular mention. This firm is the sole Pacific Coast Agent for the Perth Amboy Terra Cotta Co. A large and well selected line of wooden and iron mantels is kept constantly on hand, and the prices are such as to command the attention of those about building. The floors of Messrs. Pattison & Co's warerooms are covered with Tile and Parquette flooring of the most beautiful and artistic designs, and should be examined before purchases are made elsewhere. Special personal attention is given to furnishing designs and estimates for all work connected with the tasteful arrangement of everything connected with Mantels and Tiling. This firm also makes a specialty of stained glass. Write or call for information as per address mentioned.



COUNTRY
BUILDING INTELLIGENCE

In this and succeeding issues we intend to devote considerable space to information in connection with buildings, from every portion of the coast.

Only reliable news will be found in this column. Our custom has been for the past eight years, to furnish only data which could be relied upon. We will not publish rumors of "THIS AND THAT IS GOING ON" unless we are reasonably assured that such is truly the case. In all cases we will file our authority for any statements made in this column. No doubt mistakes will sometimes occur, but these we intend to be a rare exception to our rule of reliable news.

We desire the co-operation of country editors and mechanics to this department of this journal. By spreading the news of building engagement in your part of the country, you enhance the value of your section by proclaiming it a go-ahead community.

Architects should also notify us of "plans to figure on;" we do not charge anything for the insertion of such notices. Remember this journal is in the EIGHTH YEAR of its existence, and is the only journal published this side of the Rocky Mountains in the interest of Architects, Contractors, and Material Men.

Alameda.

William Neal is building two neat cottages on the corner of Clinton Avenue and Oak Street. They will contain four and five rooms respectively, and will cost about $1,500 each.

Lumberman's Hand-Book, for $2.00.

MODERN ARCHITECTURAL DESIGNS AND DETAILS. A few copies remain of this really good work. Price, $10.00.

DETAIL COTTAGE AND CONSTRUCTIVE ARCHITECTURE. Similar to the above in general design.

LEFFELL'S HOUSE PLANS. $3.00 post-paid.

SCIENCE OF CARPENTRY MADE EASY. Price, $5.00.

MECHANIC'S GEOMETRY, or the Science of Framing by the use of Card-board Models. $5.00.

We will send the CALIFORNIA ARCHITECT for one year, *free*, to purchasers of either of the latter two works.

THE AURORA, a family magazine. Printed by Bacon & Co., San Francisco. With no "continued stories," clear type, exceptionally good reading matter, the *Aurora* recommends itself as an interesting family magazine. The price, for such first class matter, is exceptionally low, being but $1.50 per year. The San Francisco News Co. is the general agent, to whom orders can be addressed.

CORRUGATED iron conductor pipes are better than tin. In the first place they will expand when filled with ice, without bursting, and in the second place outlast tin.

CONTRACTORS, ATTENTION!

For $5.00 we will insert your business card for one year, and send you this Journal, free.

A Famous Property to be Sold.

THE West Point Foundry has been posted for sale at the Real Estate Exchange. This property is situated at Cold Spring, Putnam County, in this State, and comprises forty acres of land with several acres of buildings.

The foundry was established in 1819, and has been in constant operation ever since. In 1820, orders were received for cannon for the United States Government, and a lot of thirty-two pounders, round shot, smooth bore, were turned out, which were considered great guns in those days. All the celebrated "Parrott" guns, which played so important a part in settling the contest for the Union during the civil war, were made in this establishment.

The latest and most pretentious work undertaken was the finishing of two eight-inch rifled steel guns, being of the very few of the largest calibre of that description as yet made in the United States.

At present there are but two other gun-making establishments in this country, one at South Boston and the other at Washington; the West Point foundry, however, is the largest and most completely equipped of the three.

The property was located at Cold Spring before the advent of steam or the railroad, on account of the superior water power (twenty-eight feet fall), and also with a view to increased safety on account of the distance from the coast. It has grown to its present proportions gradually; latterly steam power has been supplied, and now the largest castings used for any purpose are being turned out for contractors all over the country.—*Real Estate Bulletin, N. Y.*

A Cozy Home.

THIS is the title of a new work by Frank L. Smith. It contains full plans and elevations for 10 houses ranging in cost from $1,500 to $5,000. The general character of the work may be told by its full title, viz., "A Cozy Home, How It Was Built, A Discussion of Its Design, and the Methods and Materials Employed in Its Construction." From the title one would infer that but one plan was given; but the author embraces 10 complete plans, with practical suggestions on each.

We have received a large consignment of the above work, and will forward a copy to any address upon receipt of the price, TWENTY-FIVE CENTS.

STRONG DAMP-PROOF GLUES.—For a strong glue which will hold in a damp place the following recipe, says an excellent authority, works well. Glue prepared in this way will hold leather belts in damp cellars, wheel pits and similar situations.

Take of the best and strongest glue enough to make a pint when melted. Soak this until soft. Pour off the water as in ordinary glue-making, and add a little water if the glue is likely to be too thick. When melted add three tablespoonfuls of boiled linseed oil. Stir frequently and keep up the heat till the oil disappears, which may take the whole day and perhaps more. If necessary add water to make up for that loss by evaporation. When no more oil is seen a tablespoonful of whiting is added and thoroughly incorporated with the glue.

Prepared in this way the glue is stronger than that made in the ordinary way and resists dampness far better.

THE British Consul at Swatow, who forwarded thirteen parcels containing samples of tools in common use by Chinese carpenters, and soon to be exhibited before the manufacturers and artisans of Sheffield, says he has always noticed in the Chinese carpenter's tool-box at least one, if not more, old European plan-irons or chisels, in many instances worn down a third of their original length. This seems to him to indicate a preference for European steel, and that were tools made of such steel, obtainable at anything like the market rate of Chinese tools, a large trade might be the consequence, for the carpenter plays a very important part in Chinese house-building. Fine finish and polish were quite unnecessary, the only requirements being durability and cheapness.

A YOUNG mechanic wants to know how to tell whether butts are for left or right-hand doors. Lay the butts on the bench or table with the knuckle-joint toward the right hand. If they are open at the top they are right hand; if open at the bottom, they are left hand. A door that opens away from you to the right, is called a right-hand door. If it opens away from you to the left, is is called a left-hand door.

SPIRITS of turpentine will remove unpleasant odors from the hands when all other deodorants fail.

THE CALIFORNIA ARCHITECT AND BUILDING NEWS.

VOLUME VIII. ENTERED AT POST-OFFICE, SAN FRANCISCO, AS SECOND-CLASS MAIL MATTER. ESTABLISHED JANUARY, 1879. NUMBER 6.

THE

California Architect & Building News.

Established January, 1879.

The official organ of the San Francisco Chapter American Institute of Architects. Published by the SAN FRANCISCO ARCHITECTURAL PUBLISHING CO. No. 240 MONTGOMERY STREET, Rooms 11, 12, 13.

Terms per annum - - - - $2.00 in advance.

Published on the 15th of each Month.

When money is sent for subscriptions, the receipt of a copy of this Journal is an acknowledgment that it has been received. Unless requested we do not send receipts.

SAN FRANCISCO, CAL., JUNE 15, 1887.

The Amended Mechanics' Lien Law.

IN the April number of this journal, taking our cue from statements published by our daily contemporaries, that among the bills *not signed* by the governor was the amendments to the Mechanics' Lien Law, our views of the matter from that standpoint were plainly expressed, and, although in error as to the main fact, the spirit of the article was and is pertinent, as far as setting forth the views of ninety-five per cent of all those interested, and the monstrous defects of the law then and now are concerned—were misled to the conclusion that the amendments had been consigned to a silent repose for at least two years, by reason of the governor failing to approve. We now find in the recently published statute book, containing the enactments of the late Legislature, a series of attempted amendments approved by His Excellency, which to some extent amends, and in others confuses badly, so much so that one of the ablest of the legal profession remarked to us, "I have made the lien law of California a study, and had gained, as I supposed, a fair interpretation and understanding of its intricacies, but now I must admit that I am all at sea, not feeling assured of anything under the law; and further, if subjected to a strict legal analysis before an intelligent court of competent jurisdiction, I am satisfied that it would be so thoroughly shattered and divested of practical force and effect that what remained would be of service only as waste paper."

The attempt to amend—make better—is a very defective piece of legislative work, in that it fails to remedy numerous glaring defects, which have caused much annoyance, inconvenience, and trouble in building circles, and drawn curses loud and long from thousands who have experienced the hardships imposed by some of the unreasonable provisions.

The amendments as passed will be found in full in another part of this issue. *Reputed owner* is generally introduced for *owner*, as found in previous law, to avoid mistake in the identity of the responsible contracting party. Section 1,183 is also amended in reference to filing contracts to read. "*Said contract, or a* MEMORANDUM *thereof, setting forth the names of all the parties to the contract, a description of the property to be effected thereby, together with a statement of the general character of the work to be done, the total amount to be paid thereunder, and the amounts of all partial payments, together with the times when such payments shall be due and payable,*" shall, "*before the work is commenced, be filed,*" etc., and, unless so filed, they "*shall be wholly void, and no recovery shall be had thereon by either party thereto.*"

We repeat that the proposition just quoted is infamous, in that it works hardships, inconvenience, and annoyance, and may be utilized to bad purposes and results. It is a legal means whereby one or more designing men may cheat and rob innocent persons. It is a legal trap in which persons not well informed as to the law—and thousands there are who are not—may be caught and fleeced, while no good purpose is served by the filing process. It is, beyond all question, special legislation, in that it applies to and affects specially building contracts, and no others, and as such is unconstitutional and illegal, while its monstrousness is severely aggravating, in so far as it dictates to contracting parties that an obligation entered into by and between them shall be and become void unless conforming to a notion conceived in and emanating from the brains of one or more fanatics who imagined it necessary for their purposes, and hunted up a funny idea, which, by personal effort and influence, they managed to push through the Legislature, and have made into a law, for the purpose of controlling the actions of thousands, nine-tenths of whom utterly disapprove the measure. Legislation which seeks to vitiate the solemn obligations of contract, other than for fraud, is a step in advance of reason and right between man and man.

The amendment which now makes it necessary to file the whole contract, *or a memorandum of its contents*, changes the filing feature some, and will perhaps puzzle those of our Superior Judges who have enunciated the doctrine that the specifications are and must be considered under the former law as a part of the contract itself. Will they now hold that the memorandum is virtually the contract, and that the specifications also attach thereto? The law as amended reads, Such contracts "*shall be subscribed by the parties thereto;*" and this is followed by, "*or a memorandum thereof,*" and shall be filed, but no provision is made as to or by whom the filing is to be done, nor as to whether at all, or by whom the memorandum is to be signed. The facts to be set forth in the memorandum are defined, but nothing in words appears as to the signing. Section 1184 is also amended, but still retains that most silly, inconvenient, and unbusiness-like provision "that twenty-five per cent of contract amount shall remain unpaid for at least thirty-five days after the final completion of contract, while another section provides that sub-contractors, material men, etc., shall have but thirty days within which to file their liens; consequently, those who have claims for work done or materials furnished must either resort to the actual filing of a lien within "thirty days," or lose all security in the building for and upon which they have performed labor or furnished materials. If they fail to do this, then they are entirely at the mercy of the contractor, who, if not honest and able to meet his obligations, can, if so disposed, devise means which will give his creditors no better, at best, than a judgment of legal process. Common sense and fairness would have suggested that the advantage of the five days' time should be in favor of the right to lien, the twenty-five per cent retained to be due and payable in twenty-five days, or the time to be made equal in both cases. Cases are on record where "smart Alicks" have waited until the last moment, and when too late for other creditors to prepare and file liens, the sly ones have secured to themselves the material defects of the law, and filed claims for the full amount due them, although the balance of contract money has not been sufficient to pay more than seventy-five per cent of the total sum of indebtedness. It is all right and proper that every creditor should save himself from loss, when he can do so with equal justice to all other parties similarly situated, but when established law provides the strategy by which the shrewd, cunning, and unscrupulous may gain advantages, and beat the trusting and unsuspecting, such laws must be considered as more infamous than just.

Our readers, however, will be able, by comparing the amendments with previous law, to judge of present merits, if any there are to be found in the Mechanics' Lien Law, as it is and will be for the next two years.

An Act to amend sections 1883, 1884, 1887, 1191, and to repeal section 1203 of an Act of the Legislature of the State of California, entitled, "An Act to establish a Code of Civil Procedure," approved March 11, 1872, all relating to Liens of Mechanics and others. [Approved March 15, 1887.]

The people of the State of California, represented in Senate and Assembly, do enact as follows:—

SECTION 1. Section 1183 of the Code of Civil Procedure is amended so as to read as follows:—

Lien upon property upon which they have bestowed labor.

SEC. 1183. Mechanics, material men, contractors, sub-contractors, artisans, architects, machinists, builders, miners, and all persons and laborers of every class, performing labor upon or furnishing materials to be used in the construction, alteration, addition to, or repair, either in whole or in part, of any building, wharf, bridge, ditch, flume, aqueduct, tunnel, fence, machinery, railroad, wagon road, or other structure, shall have a lien upon the property upon which they have bestowed labor, or furnished materials, for the value of such labor done and materials furnished, whether at the instance of the owner or any other person acting by his authority, or under him as contractor or otherwise; and any person who performs labor in any mining claim or claims, has a lien upon the same, and the works owned and used by the owners for reducing the ores from such mining claim or claims, for the work or labor done, or materials furnished by each respectively, whether done or furnished at the instance of the owner of the building or other improvement, or his agent; and every contractor, sub-contractor, architect, builder, or other person, having charge of any mining, or of the construction, alteration, addition to, or repair, either in whole or in part, of any building or other improvement as aforesaid, shall be held to be the agent of the owner for the purpose of this chapter. In case of a contract for the work, between the reputed owner and his contractor, the lien shall extend to the entire contract price, and such contract shall operate as a lien in favor of all persons, except the contractor, to the extent of the whole contract price; and after all such liens are satisfied, then as a lien for any balance of the contract price in favor of the contractor. All such contracts shall be in writing when the amount agreed to be paid thereunder exceeds one thousand dollars, and shall be subscribed by the parties thereto, and the said contract, or a memorandum thereof, setting forth the names of all the parties to the contract, a description of the property to be affected thereby, together with a statement of the general character of the work to be done, the total amount to be paid thereunder, and the amounts of all partial payments, together with the times when such payments shall be due and payable, shall, before the work is commenced, be filed in the office of the County Recorder of the county, or city and county, where the property is situated, who shall receive one dollar for such filing; otherwise, they shall be wholly void and no recovery shall be had thereon by either party thereto; and in such case, the labor done and materials furnished by all persons aforesaid, except the contractor, shall be deemed to have been done and furnished at the personal instance of the owner, and they shall have a lien for the value thereof.

Contracts shall be in writing.

SEC. 2. Section 1184 of the Code of Civil Procedure is hereby amended so as to read as follows:—

Contract price payable in installments.

SEC. 1184. No part of the contract price shall, by the terms of any such contract, be made payable, nor shall the same or any part thereof be paid in advance of the commencement of the work, but the contract price shall, by the terms of the contract, be made payable in installments at specified times after the commencement of the work, or on the completion of specified portions of the work, or on the completion of the whole work; *provided*, that at least 25 per cent of the whole contract price shall be made payable at least thirty-five days after the final completion of the contract. No payment made prior to the time when the same is due, under the terms and conditions of the contract, shall be valid for the purpose of defeating, diminishing, or discharging any lien in favor of any person, except the contractor, but as to such liens, such payments shall be deemed as if not made, and shall be applicable to such liens, notwithstanding that the contractor to whom it was paid may therefore abandon his contract, or be or become indebted to the reputed owner in any amount for damages or otherwise, for non-performance of his contract or otherwise. As to all liens, except that of the contractor, the whole contract price shall be payable in money, and shall not be diminished by any prior or subsequent indebtedness, offset, or counterclaim, in favor of the reputed owner and against the contractor; no alteration of any such contract shall affect any lien acquired under the provisions of this chapter. In case such contracts and alterations thereof do not conform substantially to the provisions of this section, the labor done and materials furnished by all persons except the contractor shall be deemed to have been done and furnished at the personal instance and request of the person who contracted with the contractor, and they shall have a lien for the value thereof. Any of the persons mentioned in section 1183, except the contractor, may at any time give to the reputed owner a written notice that they have performed labor or furnished materials, or both, to the contractor, or other person acting by authority of the reputed owner, or that they have agreed to do so, stating, in general terms, the kind of labor and materials, and the name of the person to or for whom the same was done or furnished, or both, and the amount in value, as near as may be, of that already done or furnished, or both, and of the whole agreed to be done or furnished, or both. Such notice may be given by delivering the same to the reputed owner personally, or by leaving it at his residence or place of business, with some person in charge, or by delivering it to his architects, or by leaving it at their residence or place of business, with some person in charge, or by posting it in a conspicuous place upon the mining claim or improvement. No such notice shall be invalid by reason of any defect of form, provided it is sufficient to inform the reputed owner of the substantial matters herein provided for, or to put him upon inquiry as to such matters. Upon such notice being given, it shall be the duty of the person who contracted with the contractor to, and he shall, withhold from his contractor, or from any other person acting under such reputed owner, and to whom by said notice the said labor or materials, or both, have been furnished, or agreed to be furnished, sufficient money due, or that may become due to such contractor, or other person, to answer such claim and any lien that may be filed therefor for record under this chapter, including counsel fees not exceeding one hundred dollars in each case, besides reasonable costs provided for in this chapter.

Written notice of labor performed.

Notice, how delivered.

SEC. 3. Section 1187 of the Code of Civil Procedure is amended so as to read as follows:—

Time and place of filing claim.

SEC. 1187. Every original contractor, within sixty days after the completion of his contract, and every person, save the original contractor, claiming the benefit of this chapter, must within thirty days after the completion of any building, improvement, or structure, or after the completion of the alteration, addition to, or repair thereof, or the performance of any labor in a mining claim, file for record with the County Recorder of the county in which such property, or some part thereof, is situated, a claim containing a statement of his demand, after deducting all just credits and offsets, with the name of the owner or reputed owner, if known, and also the name of the person by whom he was employed, or to whom he furnished the materials, with a statement of the terms, time given, and conditions of his contract, and also a description of the property to be charged with the lien, sufficient for identification, which claim must be verified by the oath of himself, or of some other person; any trivial imperfection in the said work, or in the construction of any building, improvement, or structure, or of the alteration, addition to, or repair thereof, shall not be deemed such a lack of completion as to prevent the filing of any lien; and in case of contracts, the occupation or use of the building, improvement, or structure, by the owner, or his representative, or the acceptance by said owner or his agent of said building, improvement, or structure, shall be deemed conclusive evidence of completion; and cessation from labor thirty days upon any unfinished contract, or upon any unfinished building, improvement, or structure, or the alteration, addition to, or repair thereof, shall be deemed equivalent to completion thereof for all the purposes of this chapter.

Description of property.

SEC. 4. Section 1191 of the Code of Civil Procedure is hereby amended so as to read as follows:—

Lien upon lot for improving.

SEC. 1191. Any person who, at the request of the reputed owner of any lot in any incorporated city or town, grades, fills in, or otherwise improves the same, or the street or sidewalk in front of or adjoining the same, or constructs any areas, or vaults, or cellars, or rooms, under said sidewalks, or makes any improvements in connection therewith, has a lien upon said lot for his work done and materials furnished.

SEC. 5. Section 1203 of the Code of Civil Procedure is hereby repealed.

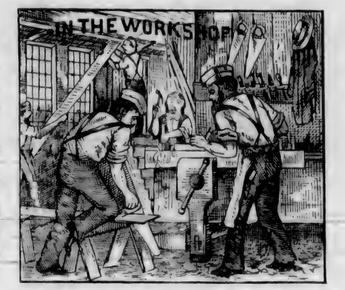
SEC. 6. This Act shall take effect and be in force from and after its passage.

ESSENTIALS OF PERSPECTIVE.

By L. W. MILLER. Price, $1.50. The newest as well as one of the best of the books on the subject.

ASKED, ANSWERED, and COMMUNICATED.

☞ Architects, Contractors, Carpenters, and mechanics generally are respectfully requested to furnish us items of interest for this column. We will gladly answer any and all questions pertaining to the architectural and building interests. If illustrations are necessary to explain your ideas, send us a sketch of them, and we will make the cuts. We especially invite suggestions from apprentices and young mechanics.



Not Enough Draughtsmen.

SEVERAL times, in the columns of this journal, we have called attention to the scarcity of draughtsmen. And although several promptly answered our appeals, the demand is now greater than at any previous time. From ten different towns and cities, and from numerous offices in this city, comes the demand for first-class draughtsmen, and there are none to fill the places. We can immediately place several in good positions, if they will send us their address, and state their qualifications. Wages will vary from $18 to $25 per week, according to ability.

Wrong Statements Corrected.

IN the May issue of the *Carpenter*, the following statement appears:—

CALIFORNIA.

"Stay away from the Pacific Coast. The cheap railroad fares have flooded every town with hordes of idle labor willing to work for even a dollar a day. Wages flat and work scarce.

ALAMEDA.—Moderate; $2.50 to $3. 9 hours.
SAN FRANCISCO.—Overstocked; $2.50 to $3. 9 hours.
SAN RAFAEL.—Middling; $2.25 to $3. 9 hours.
OAKLAND.—Dull; $2 to $3. 9 hours a day.
LOS ANGELES.—Fair; $2.50 to $3. 9 hours.
PASADENA.—Medium; $2.50 to $3. 9 hours.
SAN DIEGO.—Middling; $2.25 to $3. 9 hours.
SANTA BARBARA.—Dull; $2.40 to $3.
SAN BERNARDINO.—Quiet; $2.00 to $3.00."

In several places in the same issue, attention is called to the remarkable dullness in building circles, and the low prevailing wages received by mechanics. We do not know the source from whence the *Carpenter* gets its information, but we emphatically protest against any journal printing news and disseminating the same as gospel truths, without first receiving the most unqualified assurances from *different* sources, that the statements made are correct. We have frequently noticed, in trade journals, that the opinion of one man is given as the sentiment of the entire community, and should his feelings be warped by presumed bad treatment of any of his workmen companions, the neighborhood is to be condemned and written down, because the one man hath so ordained.

San Francisco is not "overstocked" with carpenters willing to work for "$2.50 to $3.00 per day of nine hours." *Carpenters* are generally well employed, and the ruling rate of wages is $3.50 per day, and no *carpenter* will work under that rate. Unfortunately, we have an army of floor-layers, piece-workers, etc., who will take anything they can get at any price; but, in behalf of the CARPENTERS of the Pacific Coast, we protest against placing such scabs in the same category as mechanics.

San Rafael is but a small country town of not over 3,000 inhabitants, but we venture to say, without fear of contradiction, that there is not a *carpenter* working in or around the town, who receives but $2.25 a day, as per clipping prices.

We think if the San Bernardino *carpenters* could get hold of the informant who quotes their wages at $2.00 per day, there would be little left of him to write future articles. And so with the whole list; there is not a fair statement in any case, of either amount of work, or wages.

In this city building is very brisk, as our regular monthly statements will prove. In Oakland more work than usual is going on, and much more to follow. Los Angeles and San Diego are reveling in present activities and future engagements. In fact, all over the State there is more work being done in the building line than for many years past for similar periods. The ruling wages for *carpenters* is $3.50 per day, with a reduction for piece-workers and apprentices.

To the honor of California *carpenters*, it may be said that sooner than work at their trade for less than mechanic's wages, they would stow their tools in the basement, and go to the harvest field, or other honest employment, at $40 per month and board.

WHY DOES VARNISH CRACK?—How many paintings and how much decorative coloring is spoilt by cracking of the varnish. Much of this is due to poor mastic varnish. Good varnish on good color coats will not give any signs of cracking, until, by repeated varnishings, it has accumulated a thick coating of brittle, inelastic gum. On the principle that it takes two to make a quarrel, two or more coats of varnish must be given before this trouble makes itself manifest. As in all drying concretion occurs, one cause of cracking is putting on one coat before another is perfectly dry. To reduce the risk of cracking to a minimum, where varnish is to be applied as a finish, all coatings should have oil in their composition, and yet be mixed to dry flat, and they should be applied very evenly and thinly, even if this necessitates an extra job.

Varnish colors may be painted on the glass of inside of window to imitate stained glass. Some very brilliant colors may thus be obtained.

THE production of cut nails in the United States in 1886, is the greatest in the history of the country, being 8,160,963 kegs, as against 6,696,815 kegs in 1885.

Cutting Rafters.

I HAVE a rule for cutting rafters one-third pitch which may interest the readers of *Carpentry and Building*. Suppose the building to be 18 feet wide. I take half the width of the building, which in this case is 9 feet. I multiply by $2\frac{1}{2}$, and call the answer inches, giving in this case $22\frac{1}{2}$ inches, or 1 foot $10\frac{1}{2}$ inches. I add this to half the width of the building, which gives the length of the rafter 10 feet $10\frac{1}{2}$ inches. Since this overruns, say $\frac{1}{16}$ inch to the foot, it would make this measurement $\frac{9}{16}$ inch too long. Call this $\frac{1}{2}$ inch, which leaves the rafter 10 feet 10 inches in length. The figures I would make in a problem of this kind would be as follows:—

18	9	
$4\frac{1}{2}$	1	$10\frac{1}{2}$
$22\frac{1}{2}$	10 ft. 10 ins.	

The matter of subtracting the $\frac{1}{2}$ inch excessive length in this case, alluded to above, would be done in the head. I shall be glad to know what the readers of the paper think of this method.—*S. J. P., in Carpentry and Building.*

Characteristic of a Good Floor.

ONE of our contemporaries in specifying the features of a good floor arranges the specification in the following form:—

A good floor should be
A test of the builder's skill;
Of thoroughly seasoned lumber;
Without creaking boards;
Without splintering edges;
Without gaping joints;
Without curling section;
Flat as a table-top;
Rigid and smooth;
Almost imperceptibly jointed;
Undisturbed when laid;
Laid on straight-edged joists;
Without heading joints;
Laid without showing nails;
Of edge-nailed boards;
Laid on a bed-floor.
A good floor is a rarety.

THE Supreme Court of Vermont has announced its decision in the famous case of the Rvegote stonecutters' conspiracy, growing out of the attempt of the workmen to prevent the employment of other workmen, and to deter them from working by denouncing them as "scabs," and threatening to make them publicly odious as such. The decision of the Supreme Court is that a conspiracy among workmen to prevent others from working or from being hired is a crime at common law, and punishable under the statutes of Vermont.

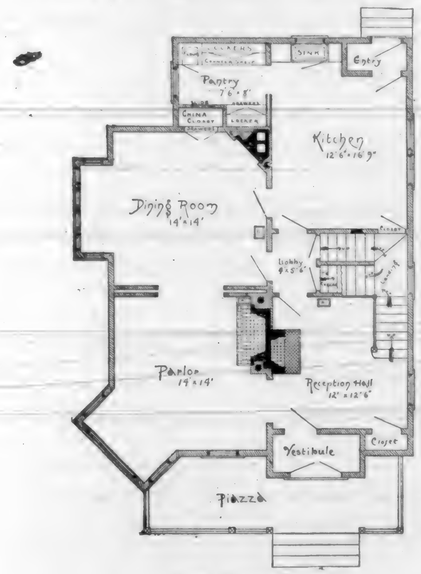
Front Elevation.

A Cozy Home; How It Was Built.

FRANK L. SMITH, ARCHITECT.

THE suburban cottage and its construction have become of prime interest to a large class of people at the present day. Being of comparatively small cost, and lending itself to varied and attractive design, a man of quite limited means may aspire to the ownership of a cozy home, where he can put into execution the ideas he may have fostered for a long time as to what a house and its furnishings should be. He studies the many architectural publications, and sees many designs that please him in some respects, and many more that he has no use for whatever. Turning from one to the other, not finding just what he wants, he despairs of obtaining a ready-made plan. The chances of his doing so are about even with his getting a ready-made coat that will be a perfect fit. He may find something that will answer, but falls far short of what he wants.

The average man who is to build a low-cost dwelling does not seek or employ an architect's services, for the reason that he believes he can put the money to better use in the finishings of the house, and the inevitable result is that he is not satisfied. One forgotten thing after another will crop up, and a change is made here, and a change there; and finally, after nearly endless worry, he enters a completed house that is not what he wanted, and that has overrun his estimate. He resolves to build again as soon as he can dispose of his first venture, and a second time will profit by his previous experience. But the building of one house is not sufficient to enable a man to steer clear of the many pitfalls in house building, and the only satisfactory and economical way is to employ an architect in the beginning.



First Floor Plan.

Make up your mind what you wish to have and to spend, and if the two do not agree, either take what your money will buy, or do not build. Employ an architect in whom you have confidence, and do not be in a hurry. Carefully study the sketches he will make for you, have everything arranged beforehand and reduced to writing, and there is no reason why your house should cost you a cent beyond the estimate, or cause you more anxiety than getting a new suit of clothes.

* * * * * * * * * * *

A client of mine came in the office and said, "I want a snug, cozy home. I have not a great amount at my disposal, but that little I want spent judiciously. I do not want an inch of room wasted. There must be three rooms upon the first floor, with a large entrance or reception hall, easy flight of stairs, dining-room and parlor communicating with sliding doors, one fire-place at least, large kitchen, with ample pantry accommodations, and back stairs, bay-window in dining-room, and corner bay-window in parlor. On second floor there must be four chambers, ample closets, bath-room, and access to the attic, though latter is not to be finished. All rooms are to be accessible from a common hall, and the whole to be quiet, and yet attractive in appearance. Now can I get such a house built for $3,000?"

Here was a client whose requirements were modest, and whose wants are similar to those of one-half the people who build houses. In a short time I had prepared the plans illustrating this article. The house was commenced, and in three months ready for occupancy. Everything having been fully determined upon in the beginning, the owner had but few suggestions to make as the work progressed, and his dreams were unclouded by visions of "extra" bills, that too often prove the bugbear of building operations.

* * * * * * * * * * *

Are you not in need of an architect's services? If you intend to build a house, you certainly are. But I hear you say that your friends and neighbors have built houses time and again, and that they managed to get along without an architect, and consequently have saved money.

It certainly is true that the large majority of dwelling-houses are built without the services of an architect; yet it does not follow that such services are not beneficial, and even necessary.

When you have a case at law, you do not appear before the justice in your own behalf, but rather place your interests in the hands of an able advocate. When your child is ill, you do not go at once to the apothecary; but, instead, you call the family physician, and let him first prescribe.

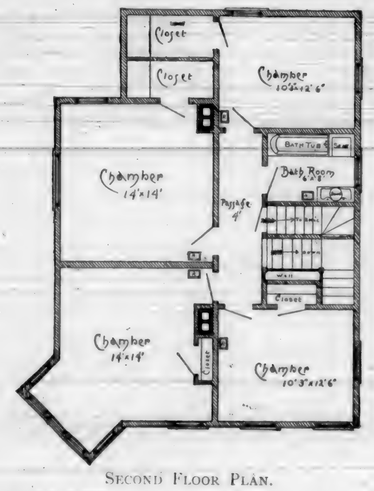
The architect stands to his client very much in the light of both attorney and physician. He makes a "diagnosis" of your case, after a careful investigation; prescribes in the shape of plans and specifications; sends you to the carpenter, who compounds the prescription. He draws up the legal papers, audits the accounts, and, in the end, assures you that you have been fairly dealt with, and have received what you have paid for.

An architect is not necessarily a builder, any more than a physician is an apothecary; nor is the carpenter necessarily an architect, any more than the apothecary is a physician.

The architect can save you money. He discovers your wants, your likes, and your dislikes. He reduces them to a tangible form; he draws up the specifications so minutely that every variety of material and labor is distinctly set forth as to its quality and kind.

When completed, plans and specifications are presented to a builder for an estimate. He knows exactly what is expected of him. There is no chance for controversy or quibble; all has been settled by the owner through his architect. In consequence, if several contractors estimate upon the building, it is known that their figures are all upon the same basis.

Where a carpenter receives his orders directly from the owner, in some such a way as this, "Build me a house like Mr. Brown's,



Second Floor Plan.

but with such and such changes," there never can be any definite contract, for the changes and alterations, in the way of "extras," amount to a very considerable sum in most cases. Carpenters like these "extras," though they often grumble about them, for they are the fat pickings of the job, and are often a source of more profit than the original contract.

"Extras" are to be rigidly avoided, and it is the duty and province of the architect to so perfect his plans and specifications that none will be necessary. On almost every building erected in such a manner, enough might be saved on the extra work to more than pay for an architect's services.

* * * * * * * * * * *

This article and the illustrations accompanying are from a new work entitled, "A Cozy Home," the price of which is but *twenty-five cents*. We are indebted to the author, Frank L. Smith, architect, for the use of the cuts and the extracts from the book. "A Cozy Home" contains ten full sets of plans, one set of which is here represented complete. To anyone contemplating building, the "Cozy Home" will give many valuable ideas. We have a full supply on hand, and will send a copy, post-paid, upon the receipt of twenty-five cents.

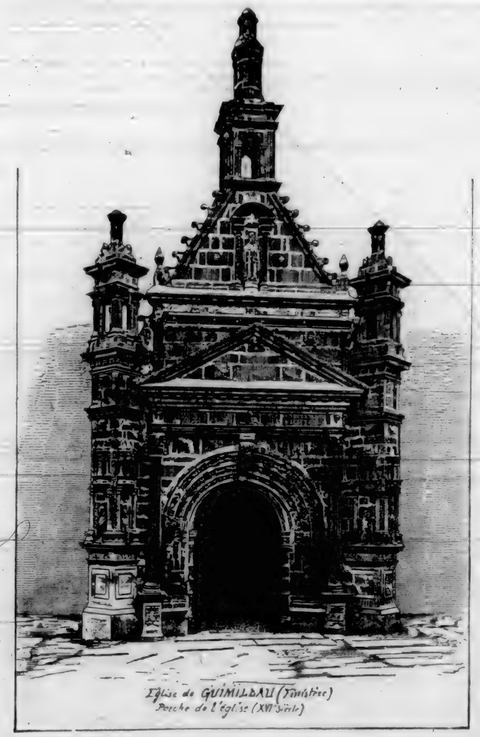
Draughtsmen Wanted.

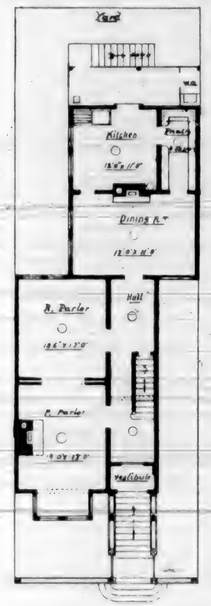
We have situations for 20 good draughtsmen. Send your address to this office for full particulars. Those wanting places in first-class offices please correspond with us immediately, as the demands are urgent.

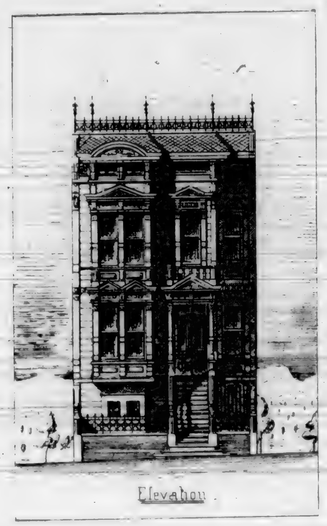
Are Advertisements Read?

WE have always taken the ground that advertisements in a trade journal are as much read as the editorial matter itself. In fact, many people subscribe more for the purpose of keeping the run of all the new things connected with the building interests than they do for the "good ideas" contained in the reading columns. Those that study and invent or manufacture superior articles for use in buildings or connected therewith, are sure to let people know of their wares through the columns of the trade journals. The following pithy observations are not original with the editor of this journal, but they will be well worth careful reading:—

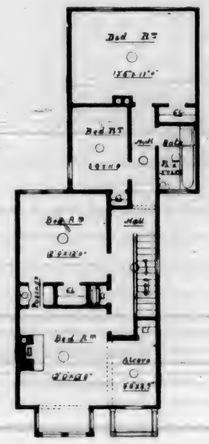
The first time a man looks at an advertisement he does not see it.
The second time he does not notice it.
The third time he is dimly conscious of it.
The fourth time he faintly remembers having seen something of the kind before.
The fifth time he half reads it.
The sixth time he turns up his nose at it.
The seventh time he throws the paper down impatiently.
The eighth time he ejaculates, "There's the confounded thing again!"
The ninth time he wonders if there is anything in it.
The tenth time he thinks it might possibly suit somebody else's case.
The eleventh time he thinks he will ask his neighbor if he has tried it, or knows anything about it.
The twelfth time he wonders if the advertiser can make it pay.
The thirteenth time he rather thinks it must be a good thing.
The fourteenth time he happens to think it is just what he wanted.
The fifteenth time he for a long time resolves to try it as soon as he can afford it.
The sixteenth time he examines the address carefully and makes a memorandum of it.
The seventeenth time he is tantalized to think he is hardly able to afford it.
The eighteenth time he sees painfully how much he is in need of that particular article.
The nineteenth time he counts his money to see how much he would have left if he bought it.
The twentieth time he rushes frantically forth and buys it.







Elevation



Second Floor Plan

A Two-Story City Residence.

IN this design we give the floor plans and geometrical elevation of an eight-room city dwelling. This building has a front of twenty-five feet by a depth of sixty-five feet, including rear porch, and occupies a lot twenty-five feet front by one hundred and twelve feet six inches deep, and contains a basement story under the entire building seven feet six inches high, occupied by a laundry, cellar, and store-rooms. The building is so arranged that the rooms are lighted from each side, as well as from the front and rear. The house is entered through a deep, richly-paneled vestibule, into a wide hall communicating directly with all the rooms, and containing a flight of stairs terminating in the second story hall, with turned black walnut newel-posts at the top and bottom. The two parlors are connected by large sliding doors, nine feet high and six feet six inches wide, and when thrown open make a very large and elegant apartment. The fire-places are finished in best Italian marble, and each has an ash-pit communicating with the cellar. The rear hall in the second story is a continuation of the main hall, separated by an arch. The stairs and halls are lighted by windows three feet wide by two feet high, and glazed with colored glass, with ornamental figure in the center.

The front bedroom has an alcove room separated by an arch, which should be used for a dressing-room. The two front bedrooms have a passage between them, containing a wash-basin with marble top and back. On one end of the rear porch is a water-closet, inclosed with tongued and grooved boards, dressed and painted. A flight of rear stairs, descending from the rear porch, communicates with the rear yard. The well-proportioned bay-window, graceful cornice, iron cresting, portico, balcony, etc., are solidly constructed, and speak for themselves without further comment on the beauty and artistic appearance of the building.

How to Prepare Calcimine.

SOME of our readers may wish to prepare their own calcimine, and we give these rules for the purpose of enabling them to do so:—

Soak one pound of white glue overnight; then dissolve it in boiling water and add twenty pounds of Paris white, diluting with water until the mixture is of the consistency of rich milk. To this any tint can be given that is desired.

Lilac—Add to the calcimine two parts of Prussian blue and one of vermilion, stirring the mixture thoroughly, and taking care to avoid too high a color.

Brown—Burnt umber.

Gray—Raw umber, with a trifling amount of lampblack.

Rose—Three parts of vermilion and one of red lead, added in very small quantities until a delicate shade is produced.

Lavender—Make a light blue and tint it slightly with vermilion.

Straw—Chrome yellow, with a touch of Spanish brown.

Buff—Two parts of spruce, or Indian yellow, and one part of burnt sienna.

Blue—A small quantity of Prussian blue will give a soft azure tint. Dark blue is never desirable.

Delicate tints in the foregoing varieties of colors are always agreeable and tasteful, and so great care must be taken that they are not too vivid. The tints will always appear brighter than in the calcimine pot, and the workman or workwoman must keep this fact in mind when adding the coloring powders. It is a good idea to give the ceiling a calcimine two or three shades lighter than that of the walls, so that it may seem merely a delicate reflection of their deeper tones. The ceiling can be calcimined with the lighter tint, and then more coloring added for the walls.

Origin of Slanting Roofs.

TO find the source from which the European nations have derived the art of building in stone, we must look to the land of the Pharaohs. From Egypt the craft passed to Greece, and from the Greeks it was taken up by the Romans, to be by them disseminated through the north and west of Europe in the process of colonization. The similarity, in regard to the constructive parts of the ancient Greek buildings to some of those found in Egypt of older date, affords strong confirmation of the tradition that the Greeks borrowed the art from the Egyptians. The Greeks, however, in the adopting of it, added a new feature, the pediment, and the reason for this addition is easy to find. Egypt is practically rainless. All the protection from the climate required in a palace or temple in such a country is shelter from the sun by day, and from the cold by night, and for this a flat roof, supported by walls or pillars, with archives, is quite sufficient; but when, as in all European countries, rain has to be taken into account, a slanting roof becomes a necessity. The Greeks, with their eye for symmetry, provided for this by forming the roof with a central ridge, as an obtuse angle, from which it sloped down equally on either side. The triangular space that formed at the end of the building above the architrave was occupied by the pediment, and this part of the façade, which owed its birth to the exigencies of the climate, was thenceforth regarded as so essential to the completeness of the work, that it was said that if a temple were to be erected in the celestial regions, where rain would not be possible, the pediment could not be omitted.—*Popular Science Monthly.*

MODERN HOUSE PAINTING, for $5.00.

San Francisco Chapter of Architects.

THE regular meeting of the Chapter was held on the evening of the 3d inst.—President Pissis presiding. After the reading of the minutes, and routine business was passed, the committee appointed by the Chapter to mature and submit proposed amendments and improvements to the present city ordinances relating to the erection of buildings, made a report which led to a general discussion of the subject matter, ending with instructions to said committee to proceed as rapidly as possible with the work in hand so that the issues upon the many vexing and vexatious questions so frequently arising under the present law might be met, and, if possible on the part of those now exercising arbitrary control of matters, better and more mutual understanding and arrangement between those most interested may be perfected.

The session was unmarred by a single word or occurrence not of the most pleasing and harmonious character, except regrets that every "better architect" in the city did not join in honest efforts to perpetuate an organization founded in good faith, with honest, impersonal purposes for the best good of the entire profession.

City Fire Law Ordinances Declared Invalid.

ACTING Police Judge Page, presiding in Police Court No. 1, on the 9th inst. declared Section 1752, of the peculiarly entitled—"*Order defining the Fire limits and regulating the Construction of Buildings in the City and county of S. F.*," invalid,—peculiar in that the "order" covers a thousand—more or less—distinct questions and issues, mixing up technical fire matters and matters specially architectural, scientific, and mechanical in one common jumble. The decision as understood not only invalidates the section mentioned, but the whole, nearly one hundred sections included in the "order." The "order" in many of its parts bearing upon the construction of buildings, has been a source of great annoyance to competent architects and builders, who have been held under the "order" to requirements of the most unreasonable and unnecessary character, and a great many hitches, stoppages of work from trifling and defenseless causes, arrests, etc., have from time to time occurred.

Under present circumstances, it will be necessary to formulate new ordinances covering the ground made vacant by the decision, or the legal repassage of the "order" as it is, which was declared invalid simply upon the ground of irregular publication.

We will not presume for one moment that the fire department people, who have dictated or influenced the formulation of the "order" set aside, have any other than safety and right purposes in mind, but as there are other than fire department interests involved, there should be easily available measures adopted by which mutually understood conclusions may be reached.

Semi-Annual Building Record.

TO a stranger it would appear at first glance that an unusual number of buildings were in progress of erection, but our semi-annual report does not show a very good comparison with other years.

During the month just ended we report:—

104 frame buildings, value		$477,500
7 brick	" "	196,164
26 alterations	"	57,550
137		$731,214

For comparison we give the number for each month of present year:—

Jan., 59, value		$650,750
Feb., 48,	"	204,450
March, 84,	"	353,900
April, 100,	"	636,800
May, 88,	"	692,800
June, 137,	"	731,214
516		$3,269,914

For the similar period in 1886:—

670 buildings, value	$3,486,633

A large decrease is noted in the *number* of new buildings, while there is but little falling off in the *values* of same between the two periods. This shrinkage is principally caused by the

HIGH PRICES OF BUILDING MATERIALS.

In business buildings owners do not so much stand on a difference in price of lumber, etc. But a laboring man can ill afford to pay the difference. One year ago rough lumber could be had for $15 per M. in small quantities, and much less by cargo. Rustic, best quality, $30 per M. To-day the prices are $20 for rough, and $35 for rustic. That these extortionate prices have stopped the erection of small buildings, is fully proven by our building record. Hardware, brick, etc., having been advanced in price as much as the public will stand, and lumber a little more than poor people can afford, we can reasonably expect a falling off in the erection of

AVERAGE COST FRAME BUILDINGS.

We hope the lumbermen will take this fact into consideration, and instead of calling the dealers of that commodity together for the purpose of considering how much they can squeeze out of the dear public, that they will consider that the future advancement of San Francisco is of far more importance than the addition of a few dollars to the coffers of already rich men.

The argument is used that an advance of $5.00 per M. does not effect the value of a small house more than $75 or $100. All right, then, if that is so, let the poor man have the benefit of that same $100; he will beautify the section in which he may build, to that extent, while the rich lumberman will simply place that amount in the bank to lend out at interest when occasion offers. **Let it be distinctly understood that those in moderate circumstances will not build as long as values of building materials are constantly advancing,** and this fact is **thoroughly proven** by the decrease of 154 buildings for the first six months of this year.

Advance in Lumber Rates.

PRICES have again been advanced. In fact, the changes made are so frequent that the Lumber Association merely corrects old lists and mails them to its patrons. It would cost too much to print new circulars every week. The late advances are all made in surfaced lumber. Rustic is now $35 per M., and other kinds in proportion. We hear it rumored that yet another squeeze will be given to the dear public's pocket. Price of lumber and other building materials has been raised so much that an estoppal has been placed on the erection of small buildings. A careful observer cannot but notice the few buildings in course of erection in the outlying districts. Hundreds of small houses would be dotting the blank spaces, if it was not for the greed of the Lumber Association in placing their wares at a figure to compel those in moderate circumstances to forego the building of small tenements, and repairs that are actually needed. Gentlemen of the Lumber Association, is it not about time that you halt in your design to squeeze the dear public, and give the poor residents of the Point Lobos tracts and the Mission a chance to put up a little home? Lumber is fully fifteen per cent too high in the price asked, and this is just enough to debar many from building.

ARTISTIC TILES AND MANTELS.

ONE of the most artistic displays in Tiling, Mantels, Brass goods, etc., can be found in the rooms of E. A. Pattison & Co., 308 Stockton St., San Francisco. The design in tiling entitled "Cupid among the Roses," is worthy of particular mention. This firm is the sole Pacific Coast Agent for the Perth Amboy Terra Cotta Co. A large and well selected line of wooden and iron mantels is kept constantly on hand, and the prices are such as to command the attention of those about building. The floors of Messrs. Pattison & Co's warerooms are covered with Tile and Parquette flooring of the most beautiful and artistic designs, and should be examined before purchases are made elsewhere. Special personal attention is given to furnishing designs and estimates for all work connected with the tasteful arrangement of everything connected with Mantels and Tiling. This firm also makes a specialty of stained glass. Write or call for information as per address mentioned.

"In the Heart of the Sierras"—The Noble Trees of California.

A MERE statement of dimensions and altitudes of the grand trees of California, can give no realizing sense of their idealistic presence and magnitude. It is the grandeur of their exalted individuality and awe-inspiring presence that thrills through the soul, and fills it with profound and speechless surprise and admiration; and not merely of one tree, but of whole vistas formed by their stately trunks. Who, then, by pen or pencil, can picture these as they are seen and felt?

Cut 1. The Grizzly Giant.

Once fairly within the impressive precincts of the grove of big trees, we are soon brought face to face with one of the oldest, most storm-tossed, and grizzled of this entire family of Brobdingnags. It is called

"THE GRIZZLY GIANT"

(see cut 1), and it looks at you as defiantly as the oldest veteran grizzly bear ever could. By careful measurement, we found its dimensions to be, at the ground, including a jutting spur, ninety-one feet, and three feet six inches above the ground, seventy-four feet six inches Professor Whitney places its circumference, eleven feet from the ground, at sixty-four feet three inches; with its two diameters at base, thirty, and thirty-one feet; and eleven feet above base, twenty feet. . . .

The "Mariposa" is eighty-six feet in circumference at the ground, and seven feet above it, is sixty-six feet. This tree seems to have been badly burned by two consuming fires, at different periods, after each of which the new growth has, visibly, attempted its restoration. . . . The "Workshop" is an immense living giant, with a capacious hollow at its base, which forms a room twelve by sixteen, in which all sorts of little souvenirs are made from broken pieces of the big tree. . . .

The "Haverford" (named after the "Friends" College, Philadelphia), in which sixteen horses have stood at one time, is burned into three compartments; across two of the spurs of which the distance is thirty-five feet; and transversely, thirty-three feet. . . . The "Washington" has a girth of ninety-one feet at the base, is round and very symmetrical. Although burned out somewhat near the ground, the new growth, as usual, is rapidly healing the wounds that fire has made. This is an especially excellent provision of nature for preserving and perpetuating this grand species, when in its prime; inasmuch as while restoring the ravages of the elements by the new growth, a much needed support is added to the abutments, which intercepts and prevents its premature downfall. . . .

The "Ohio" is seventy-six feet in girth at the ground, and six feet above the ground is fifty five feet. The "U. S. Grant" is sixty-five feet six inches below, and forty five feet above. The "General La Fayette" is thirty feet in diameter, and is situated about thirty yards from the above two. . . .

The "Wawona," the "Tunnel Tree" (see cut 3), through the heart of which a wagon road passes, is not only one of the great attractions of the Big Tree Grove, but may be considered one of the sights of California. At the base this tree is twenty-seven feet in diameter; while the enormous trunk, through which the excavation is made, is in solid heart wood, where the concentric rings, indicating its annual growth, can be readily seen and counted, and its approximate age determined by actual enumeration, and thus satisfactorily settle that interesting fact beyond the least peradventure. The arch, or "tunnel," as it is called, is ten feet in height, by a width of nine feet six inches at the bottom, and six feet six inches at the top. "Driving through a living tree," one would suppose to be as great a feat as Daniel O'Connell's, who boasted that he could "drive a 'coach and four' through any act of Parliament ever made in the British House of Commons!" . . .

The "New York" is one hundred and four feet in circumference, and over three hundred feet in height. The "Ohio" is one hundred and three feet in circumference, and three hundred and eleven feet in height. The "Massachusetts" is ninety-eight feet, with an altitude of three hundred and seven feet. . . .

A few points of interest may be well to notice in regard to the "Mother of the Forest." If cut up into inch boards, it would make five hundred and thirty-seven thousand feet of sound lumber. From the ground to the first branch it is one hundred and thirty-seven feet. Its full height is three hundred and twenty-one feet, with a circumference at the base of ninety feet. One hundred and sixteen feet from base it is thirty-nine feet six inches circumference. The average thickness of bark is eleven inches, although in places it exceeds two feet.

Great as are these majestic proportions, they are eclipsed by those of the "Father of the Forest." This tree, when standing in its primitive majesty, is accredited with exceeding four hundred feet in height, with a circumference at its base of one hundred and ten feet. Now, with its majestic form prone

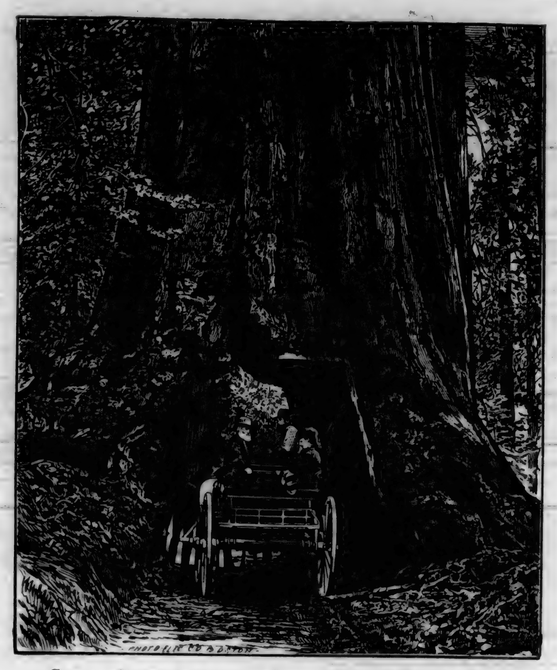
Cut 2. Miner's Cabin.

to the ground, the following measurements recently taken, proves that he was among the giants of those days, and that "even in death still lives." From the roots, to where the center of the trunk can be reached on horseback, it is ninety feet. The distance that one can ride direct through it on horseback, is eighty-two feet six inches. But no one can approximately realize the immense proportions of this prostrate forest sire, without climbing to its top, and walking down it for its entire length; by this, he will ascertain that it was nearly two hundred feet to the first branch. . . .

"Old Hercules," the largest standing tree in the grove until 1862, then being three hundred and twenty-five feet in height, by ninety-five feet in circumference at the ground; this was blown down by a heavy storm in that year. . . .

Let us take a peep at the original Big Tree stump. It is perfectly smooth, sound, and level. Its diameter across the solid wood after the bark was removed (and which was from fifteen to eighteen inches in thickness), is twenty-five feet, although the tree was cut off six feet above the ground. On July 4, 1854, the writer formed one of a cotillion party of thirty-two persons, dancing upon this stump; in addition to which the musicians and lookers on numbered seventeen, making a total of forty-nine occupants on its surface at one time.

This tree was three hundred and two feet in height, and at the ground ninety-six feet in circumference before it was disturbed. Some sacrilegious vandal removed the bark to the height of thirty feet, and had it transported to England, where it was burnt at the Crystal Palace fire. The next act in this botanical tragedy was the cutting down of the tree in order to accommodate those who wished to carry home specimens of its wood as souvenirs of their visit. But how to do this was the puzzling conundrum. If one could fittingly imagine so ludicrous a sight as a few lilliputian men attempting to *chop* down this Brobdingnaggian giant, his contempt would reach its becoming climax.



Cut 3. Driving through Living Tree "Wawona."

This, therefore was given up as altogether too chimerical and impracticable. Finally the plan was adopted of *boring it off with pump-augers* (see cut 4). This employed five men twenty-two days to accomplish; and after the stem was fairly severed from the stump, the uprightness of its position and breadth of its base, prevented its overthrow; so that two and one-half of the twenty-two days were spent in inserting wedges and driving them into the butt of the tree by logs suspended on ropes, thereby to compel its downfall. While these slow and apparently hopeless attempts were being undertaken, and the workmen had retired for dinner, a gust of wind took hold of its top, and hurled it over without the least seeming effort; its fall causing the earth to tremble as by an earthquake.

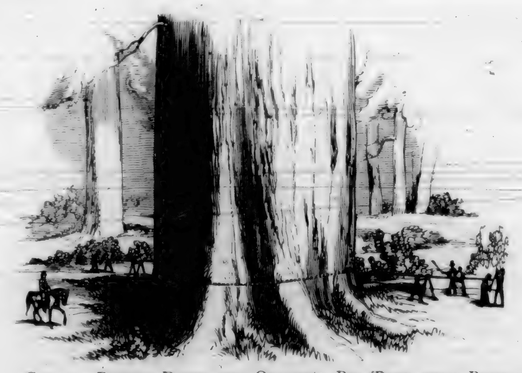
The cuts illustrating this article and the description thereof, are taken from a new work, by J. M. Hutchings, entitled, "In the Heart of the Sierras," the Yo Semite Valley, both historical and descriptive; and scenes by the way; Big Tree Groves; the High Sierra, with its magnificent scenery, ancient and modern glaciers, and other objects of interest; with tables of distances and altitudes, maps, etc. Profusely illustrated.

Copies may be had by addressing the Pacific Press Publishing House, Twelfth and Castro Streets. Oakland, Cal., or at the branch office, No. 18 Post Street, this city. Price, in fine English Cloth, embossed in jet and gold, gilt edges, $4.50. Finer bindings furnished if desired.

This work is sold by subscription, and active, energetic agents are wanted in all parts of the world. Address as above, for terms and territory.

To Soften Wrought Iron.—To soften wrought iron, heat until it becomes a low red color, and cool it in soft soap. Re-heat it to a low red as before, and let it cool in lime. It is said that this treatment makes the iron very soft.

Painting of Buildings.—The taste of the ancient Greek was too artistic and complete to allow him to indulge in the vulgar pride of parading the marble of the Parthenon when he could heighten its effects. Color was applied to all those parts which by form or position were protected from the rain. Thus the sculptures on the pediment and frieze were given highly colored backgrounds, and the sculptures themselves were painted. The brush was also employed to adorn the work of the chisel in the echinus or mouldings of the capital, and the walls beneath the colonnade were covered throughout with pictures, on the ground of polished marble, illustrative of the divinity to whom the temple was dedicated.



Cut 4. Boring Down the Original Big Tree with Pump-augers.

Measurement of Brickwork and Masonry.

Brickwork is measured by either one of four methods, viz: By the number of bricks it contains; by the number of cubic feet; by the perch of 25 cubic feet; or by the reduced rod consisting of 272 superficial feet and a width of a brick and a half. The first method is most generally employed, and the cubic foot and perch in a few localities. The reduced rod is the method used principally in England.

To ascertain the number of bricks contained in a wall: First find the superficial area, then multiply by 7½ (the number of bricks in one foot of brickwork four inches thick), and then multiply by the number of half bricks in the thickness of the wall. Example: How many bricks does a wall 12 ft. × 20 ft. and 2 bricks thick contain? Answer, 7,200, viz.: 12 × 20 = 240 × 7½ = 1,800 × 4 = 7,200.

Ashlar masonry, or that which is dressed on either face, bed, or side joints, is measured by the cubic foot; rubble masonry, sometimes in the same way, but usually by the perch of 25 cubic feet.—*Scientific American.*

Saw-Dust Ornaments; How Made.

A MOULD, or die, which has the design to be produced artistically engraved and sunk in it, is covered with thin strips of chemically prepared veneer of any desired kind of wood, and a material previously prepared, consisting chiefly of sawdust, is fed on the top of the veneer; the mould is then closed and heated, and afterward subjected to a hydraulic pressure of some tons to the square inch. The article to be produced is then taken from the mould in a semi-shaped state, inspected, recovered with veneer as often as may be found necessary, and after five or six minutes a panel, or frieze, is produced equaling in artistic effect handiwork that has taken very many days to produce. These panels have a fine surface and show up the grain of the wood well; they can also be sawed, planed, or bored like ordinary wood."

Preservation of Pencil and Charcoal Drawings.—Pencil drawings may be fixed by immersing them in weak skim-milk, or coating over them, rapidly, a solution on the drawing side, of two ounces of best alcohol, in which four grains of camphor have been dissolved. An ounce of shellac dissolved in half a pint of alcohol, applied lightly with a brush, will serve to fix charcoal drawings.

Furnishing of Plans by Architectural Journal.

NATURALLY, subscribers to an architectural journal expect to find elevations and plans of different kinds of buildings in each issue, together with information in regard to the same. But we do not conceive it to be the duty or place of the editor to advertise that plans, etc., to suit various tastes will be furnished to anyone inquiring for same.

It is with pride that we can refer to the back issues of the California Architect in this regard. During the eight years of its existence, with but two or three exceptions where individualities were distinctly shown, no plan or set of plans has been credited to the editor of this journal. It has been his aim simply to give the various designs shown as examples of California architecture, keeping his own name out of sight completely. Credit, however, in every case, has been given to those who have furnished plans or other illustrations, and letters received in regard to same, were forwarded immediately to the proper parties. The following extract will serve to show how this subject is regarded elsewhere:—

"*Should any of our readers desire to procure plans and specifications for building, whether churches, schools, dwellings, stores, carriage houses, homes, etc.; or if they desire plans made for alterations, enlargements, or additions of any kind, to existing buildings; erection of porches, bay windows, extensions, wings, etc., they are reminded that all business of the kind will receive prompt attention at this office on very moderate terms. Address* ——."

The journal from which the above is taken is not by any means the only one that is quietly but surely "cutting up into small slices" the architectural profession. Rumor has it that an architectural journal that has received all sorts of benefits and advantages from the profession in substantial form, and by being recommended to advertisers as the *only* journal representing the profession, etc., etc., and therefore the proper one to advertise in, makes it a business to run opposition to the very men who made and continue to support it, by furnishing drawings, specifications etc., etc., "*on very moderate terms*" very likely. This is another example of the "peculiarities of gratitude," doubtless the "moderate terms" prove quite effective, and while the regular practitioner may by these terms be enabled to "take a rest," young draftsmen will have excellent opportunities to pick up a few ideas and a few dollars; so, after all, everything may be for the best.

New Books Just Received.

AMERICAN STAIR BUILDER. New edition of 1887. By Lucius D. Gould. Price, $2.50. One of the best works on the subject of stair building.

MODERN COTTAGES. By J. H. Kirby. Just issued. Price, $1.50.

PICTURESQUE CALIFORNIA HOME, NO. 2. The great success attending the sale of the first volume, prompted the authors to issue the second one. The cuts in No. 2 are entirely new. Mailed to any address, either No. 1 or No. 2, for $3.50 each.

ESSENTIALS OF PERSPECTIVE. By L. W. Miller. Price, $1.50. The newest as well as one of the best of the books on the subject.

IMPROVED PLUMBING APPLIANCES. By J. Pickering. Putman, architect. 94 illustrations. Price, $1.50. A perfectly new work just received and too late for further notice in this issue.

DIRECTORY OF ARCHITECTS. Fourth edition. Price, $1.00.

MODERN ARCHITECTURAL DESIGNS AND DETAILS. A few copies remain of this really good work. Price, $10.00.

DETAIL COTTAGE AND CONSTRUCTIVE ARCHITECTURE. Similar to the above in general design.

LEFFELL'S HOUSE PLANS. $3.00, post-paid.

SCIENCE OF CARPENTRY MADE EASY. Price, $5.00.

MECHANIC'S GEOMETRY, or the Science of Framing by the use of Card-board Models. $5.00.

Master Plumbers' Association.

Howard Building, S. W. Cor. Stockton & O'Farrell Sts., S. F., Cal.

COUNTRY BUILDING INTELLIGENCE

In this and succeeding issues we intend to devote considerable space to information in connection with buildings, from every portion of the coast.

Only reliable news will be found in this column. Our custom has been for the past eight years, to furnish only data which could be relied upon. We will not publish rumors of "THIS AND THAT IS GOING ON" unless we are reasonably assured that such is truly the case. In all cases we will file our authority for any statements made in this column. No doubt mistakes will sometimes occur, but these we intend to be a rare exception to our rule of reliable news.

We desire the co-operation of country editors and mechanics to this department of this journal. By spreading the news of building engagement in your part of the country, you enhance the value of your section by proclaiming it a go-ahead community.

Architects should also notify us of "plans to figure on;" we do not charge anything for the insertion of such notices. Remember this journal is in the EIGHTH YEAR of its existence, and is the only journal published this side of the Rocky Mountains in the interest of Architects, Contractors, and Material Men.

Alameda.

San Antonio Avenue. W. H. Wharff has prepared plans for a $3,500 house for Paul Bunker.

Azusa.

Three-story frame hotel. Owner, Land and Water Co.; architect, T. Golding; contractor, day work. Cost, $12,000.

Lumberman's Hand-Book, for $2.00.
Practical Geometry, for $1.00.

CARPENTRY MADE EASY.

By Wm. E. Bell, a practical mechanic, who fully appreciates, from personal experience, that there are many things perplexing to under tand and difficult to do until they are, fully explained and tested, It is designed to make the science and art of carpentry clear and comparatively easy to all who require information on the subject. Price, $5.00 by express, prepaid.

SAN FRANCISCO, CAL., JULY 15, 1887.

The Fire Ordinances.

IN view of the fact that Acting Police Judge Page has declared order No. 1752, comprising all ordinances relating to fire matters and building construction, invalid, a general meeting of the architects in San Francisco was called and a representative number assembled on the 17th of June last to take the situation into consideration—there being no difference of opinion among the members of the profession that the order named was, and as re-enacted is, defective and insufficient. A free discussion of the subject matter was entered into, resulting in the appointment of a committee of three to prepare a petition to the Board of Supervisors asking that action be deferred in the re-passage of the order until amendatory suggestion could be prepared—it being declared invalid simply upon the technical ground of insufficient publication and requiring only proper re-publication to render it again effective.

The committee performed the duty assigned them, and although the time for completing their work was exceedingly limited, thirty-six of the most prominent architects readily appended their signatures to the petition, which was duly presented to the Board and referred without producing the result desired.

The reason for this was, as expressed by His Honor the Mayor and members of the Board, that unless the invalid order was repassed the city might be without any fire law. That while the invalidation restored the ordinance operating prior to the passage of 1752, it was not an assured fact that it would stand the scrutiny and assault of some shrewd limb of the law, who might seek and find fatal defects therein, resulting in like fate that befell order 1752; consequently, for the city's protection and safety, it became necessary to re-enact the invalid order with all its deficiencies and defects until a better could be provided. The assurance was also given that whenever a more practical form of Fire and Building Ordinance should be presented, the Board would give it attention and careful consideration, and if found to be an improvement upon the present, it would be passed.

This places the whole matter in the hands of the architects, builders, and others most directly interested to formulate a code of *Building Ordinances* that will meet every requirement of the fire department and the entire building fraternity, not including those features which may be more specially denominated *Fire Ordinances*, relating to destructive agencies, etc.

There is no disposition expressed on the part of either the architects or builders in San Francisco to antagonize the fire wardens, or the chief or members of the fire department, but there is an earnest wish that an ordinance may soon be perfected, relieved of all those features which in the past have caused annoyances, vexations, arrests, etc., for causes which if placed within the arbitration of a board of impartial, competent referees, would be given consideration according to merit, and adjusted upon equitable basis, instead of—as in the present ordinance—the same rule applying in all cases, while in fact scarcely any two are relatively equal. But if anything is to be effected in the matter, the architects or builders, jointly or severally, must take the initiative, and proceed as best judgment and experience may suggest.

Perfect Ventilation and Pure Air Essential to Human Life and Health.

THIS no intelligent person will question. It is a fact so universally understood that argument in its support is wholly unnecessary; still, while its vital importance is universally admitted, and its factorship in the healthfulness of mankind recognized, a strange degree of apathy, except in words, exists in the practical application of the means best calculated to secure this highly essential provision of the great Creator, who, in his creation of our earth, not only fixed the great sources of light in the firmament, but also surrounded the planet upon which we dwell with the prerequisite to health—pure air. As is well known, its entire absence produces death, and human life and health, in large degree, are affected by the free or restricted use of this health-giving agency.

All this being well understood, tens of thousands have employed their genius, talents, and both mechanical and scientific skill in discovering and devising the most perfect and practical method of utilizing this indispensable element in dwellings, churches, school-houses, theaters, and places where people dwell or assemble in large numbers for purposes of worship or pleasure, and as a result numerous devices have been worked out and applied that in part, at least, have produced the object sought, while but few of the inexpensive kind have gained a perpetuity beyond occasional use.

Hence it is with pleasure that we notice the invention of our fellow-townsman, Mr. P. Abrahamson, who has perfected a ventilator that must supersede all others in its simplicity, completeness, and practicability. The array of testimonials from those who have used them should be sufficient to satisfy the most scrupulous as to its effectiveness, giving, as it does, an abundant supply of fresh air without a particle of draft. It is practical for all purposes of ventilation, from the sick room to the largest structures in which people live or assemble.

Building Summary.

FOR the first time this year, our monthly report is larger than its predecessor in 1886. Values of reported improvements to date are far ahead of last year to similar period. During the month there have been commenced of building improvements,

70	frame buildings,	value	$648,700
2	brick "	"	52,500
20	alterations	"	50,500
92			$751,700

The high prices of building materials is materially affecting the construction of small houses.

Price of Lumber Again Advanced.

ANOTHER dollar has been added to the price of lumber, thus making rough lumber $21 per M; rustic, $36 per M, and other kinds in proportion. Our list will be found corrected so as to correspond with latest quotations.

We sincerely hope that the "raise" will come to a halt very soon. Lumber is now 75 per cent greater in price than it was a short time ago. We repeat again that the erection of small buildings has been practically stopped on account of the exorbitant price of materials.

Wood Mantels.

THE firm of L. and E. Emmanuel is one of our largest manufacturers of wood mantels. In a conversation with these practical men the following points were brought out:—

"The old mantels in England were made of wood. It took America a long time to discover, however, that grave-yard material is not exactly the thing to incase fire-places. Why mantels made out of marble slabs should have been introduced, it is difficult in the light of present tastes to understand. They are cold and gloomy. There is a home look about a wooden mantel that is an incentive to proper home conduct. We are not prepared to say that marble mantels have caused unpleasantness that has led to divorce, but it would not be surprising to learn that they had. Pleasant surroundings lead to contentment and happiness. No one will dispute the influence of flowers, happily chosen wall decorations and works of art. White marble slabs in our parlors and drawing-rooms do not inspire the sympathetic side of human nature. The feeling is to get away from them, and there should be nothing in a home which the inmates should want to get away from. There is nothing inviting about such mantels. They are repellent. They are going fast, and let us hope that no vitiated taste will whirl them into fashion again."

Mechanics' Liens.

THE laws of nearly all the States and Territories provide for the securing and collection of builders' and mechanics' liens upon property for which materials have been furnished, or on which labor has been performed. The following is a synopsis of the general laws relating to these liens:—

A lien is lost by the voluntary surrender of the property to the owner or his agent. There is no common law lien without possession. It is a right created by law in favor of the tavern-keepers, livery-men, pasturers, carriers and mechanics. It may be created by contract between the parties, as in a lease.

Whatever is affixed to land belongs to the owner of the land, except in a few cases. Hence, carpenters who built houses on the land of others had no lien. But as the principle is just, and the practice beneficial, States have, by law, given builders and persons who furnish material a lien on the land and building, if claimed within a limited time. Under this kind of mechanics' lien, no possession is required. The right to pay the charge and take the property is a right of redemption which is lost by a public sale of the property. The surplus, if any, is paid to the owner.

Liens by State law are generally foreclosed in a court upon a petition for that purpose. By its decree the property is sold and the proceeds divided according to the rights of the parties.

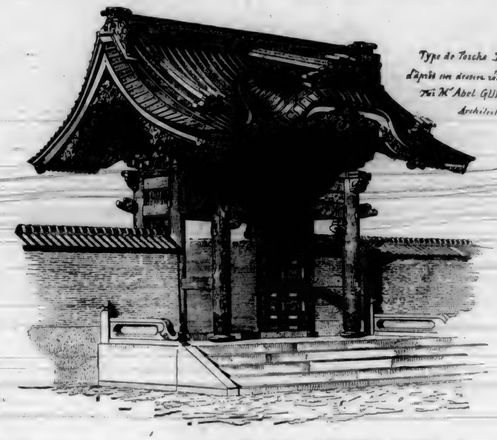
Liens may, in certain States, be enforced against vessels and wharves as well as buildings, for construction, alteration, or repairs. In most States, while the same general principle is maintained, the modes of procedure vary.

A workman desiring the protection of the law for the security of his wages, may draw up a paper, addressed to the county clerk of the county where the work was done, filled up in a manner similar to the following form, setting forth all the circumstances of the work done, his bargain with the contractor, the failure to receive his pay, and his fears that he will lose all if his lien is not made. This paper, sworn to before a justice or notary public as true, is filed in the county clerk's office and becomes a cloud upon the building, which the owner is only too glad, frequently, to remove by paying the debt himself and taking it out of the contractor's bill. In either event the owner or contractor must pay the debt if it is an honest one.

NOTICE TO THE COUNTY CLERK.

To Philip Best, clerk of the city and county of New York, in the State of New York—

SIR: Please to take notice that I, James Van Horn, residing at No. 45 Conkling Avenue, in the city of New York, in said county, have claim against William Y. Heath, owner (or only contractor, as the case may be)



of a new two-story brick dwelling-house, amounting to Nineteen Hundred and Sixty-two Dollars and forty cents, now due to me, and that the claim is made for and on account of brick furnished and labor done before the whole work on said building was completed, and which labor and materials were done and furnished within three months of the date of this notice; and that such work and brick were done and furnished in pursuance of a contract for twenty thousand serviceable brick and the mason work of putting up the outer walls of said new building, between the undersigned and the said William Y. Heath, which building is situated on lot ——, in block ——, in Westel's Addition to the city of New York, on the west side of Salina Avenue, and is known as No. 432 of said avenue. The following is a diagram of said premises:

[*Insert diagram.*]

And that I have and claim a lien upon said dwelling house and the appurtenances and lot on which the same stands, pursuant to the provisions of an Act of the Legislature of the State of New York, entitled, "An Act to secure the payment of mechanics, laborers, and persons furnishing material toward the erection, altering, or repairing of buildings in the city of New York," passed, —— 18—, and of the Acts amending the same.

JAMES VAN HORN.

New York, December 1, 1882.

James Van Horn, being duly sworn, says that he is the claimant mentioned in the foregoing notice of lien; that he has read the said notice, and knows the contents; and that the same is true to his own knowledge, except as to the matters therein stated on information and belief, and as to those matters he believes it to be true.

JAMES VAN HORN.

Sworn before me this first day of December, A. D. 1882.

J. L. LESLIE, *Police Justice.*

The lien laws of certain States provide that any person who shall either labor himself, or furnish laborers or materials for constructing, altering, or repairing any building, shall have a lien therefor upon such building and the specific lot or tract of land on which it is located; but a suit to enforce payment of said claim must begin within six months from the time the last payment therefor is due. Landlords, also, may enforce a lien for arrears of rent upon all crops of their tenants, whether growing or matured.—*Hill's National Builder.*

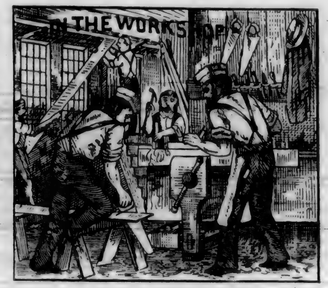
A REMARKABLE TREE.—A Nevada paper describes a remarkable kind of wood which is said to grow there. The trees do not grow large, a tree with a trunk about a foot in diameter being much above the average. When dry the wood is about as hard as boxwood, and being of a very fine grain, might, no doubt, be used for the same purposes. It is of a rich red color and very heavy. When well seasoned it would be a fine material for the wood carver. In the early days it was used for making boxes, for shafting, and in a few instances for shoes and dies in quartz batteries. Used as a fuel it creates an intense heat. It burns with a blaze as long as ordinary wood would last, and is then found—almost unchanged in form—converted into charcoal that lasts twice as long as ordinary wood. For fuel, a cord of it brings the same price as a ton of coal. Unfortunately it burns out stoves faster than any kind of coal.

DRAUGHTSMEN SCARCE.

Still the demand for draughtsmen is unabated, and many architects are really pressed for help. We can readily place twenty first-class draughtsmen in good positions. Any information will be furnished upon application to this office, either in person or by letter.

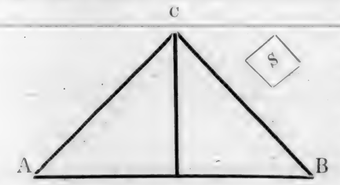
ASKED, ANSWERED, and COMMUNICATED.

☞ Architects, Contractors, Carpenters, and mechanics generally are respectfully requested to furnish us items of interest for this column. We will gladly answer any and all questions pertaining to the architectural and building interests. If illustrations are necessary to explain your ideas, send us a sketch of them, and we will make the cuts. We especially invite suggestions from apprentices and young mechanics.



Two Steel Square Problems.

TO DETERMINE by the steel square the result of any number, for example—6 multiplied by the sin 45°: Take 6 on both blade and tongue, and mark the line AC = BC = 6. Then CD drawn to the middle of AB = 6x sin 45°. Sin 45° = 0 70711.



STEEL SQUARE PROBLEM.

Problem.—Referring to any rectangular frame-work which slopes alike on all four sides. *Given*—The rise and seat of the corner-posts. *Required*—The cuts for the ends of the corner-posts, the blade of the bevel to be applied to the two faces adjoining to the ridge-line.

By the Steel Square.—On the blade take the rise. On the tongue take the seat x sin 45°. Mark along the tongue. The angle made by the tongue and the line is the proper bevel.

Problem.—Given—The run and rise of a common roof. We wish to place upon it a perpendicular square pipe to stand upon the roof diamond-shaped, thus: ◇S◇. *Required*—The cuts for the bottom end of the pipe; the blade of the bevel to be applied to the two faces adjoining the lowermost vertical edge.

By the Steel Square.—On the blade take the run of the roof. On the tongue take the rise x sin 45°. Mark along the tongue. The angle made by the tongue and the line is the proper bevel.

If the bevel is applied to mark the end of the higher half of the pipe, we have only to reverse the direction of the stock of the bevel so as to mark an obtuse angle.

—These two problems are very much alike. Their demonstration is a good study in solid geometry.—*Fred Lasey, in Builder and Wood Worker.*

To remove paint and putty from window glass put sufficient saleratus into hot water to make a strong solution, and with this saturate the paint or putty which adheres to the glass. Let it remain until nearly dry, then rub off with a woolen cloth.

Architectural Pupilage.

MR. WILLIAM WOODWARD, an English architect, gives a father the following advice concerning instruction for a son who expects to become an architect:—

1. Do not think that he is in a fair way of doing justice to himself, or to his master, by confining his studies to the office hours. Home studies, schools of art, and the other accessible fields of morning and evening architectural education, are absolutely necessary.

2. Do not think that your son has acquired much more than the rudiments of his business at the end of three or five years of pupilage, or that the architect with whom you have placed him will be able to inject into him the knowledge which his master has taken thirty years of practice to acquire.

3. At the end of his three or five years of pupilage, put him into another architect's office for, say, another five years, as an improver. This will enlarge his mind, and get him out of a few awkward grooves into which he slipped in the first office; or, better still, if within your power, let him commence practice on property which is entirely your own.

4. Unless you have friends who will secure him employment at the end of his educational career, settle the largest annuity upon him; he will require it.

5. There are abundantly ample (perhaps too many) sources of architectural knowledge open to your son; the rest is in his own hands.

A PRACTICAL HINT.—This was the way a country blacksmith was seen removing that portion of the ax handle from the ax that remained in the eye, the break being close to the iron. The wood could not be driven out, and as nails had been driven in at the end, it could not be bored out. He drove the bit, or sharp edge, into moist earth, and built a fire around the projecting part. The wood was soon charred so that it was easily removed. The moist earth so protected the tempered part of the ax that it sustained no injury.

FOR glue to be properly effective it requires to penetrate the pores of the wood, and the more a body of glue penetrates the wood the more substantial the joint will remain. Glues that take the longest to dry are to be preferred to those that dry quickly, the slow-drying glues being always the strongest, other things being equal. For general use no method gives such good results as the following: Break the glue up small, put into an iron kettle, cover the glue with water and allow it to soak twelve hours; after soaking boil until done. Then pour it into an air-tight box; leave the cover off until cold, then cover up tight. As glue is required, cut out a portion and melt in the usual way. Expose no more of the made glue to the atmosphere for any length of time than is necessary, as the atmosphere is very destructive to made glue. Never heat made glue in a pot that is subjected to the direct heat of the fire or a lamp. All such methods of heating glue cannot be condemned in terms too severe. Do not use thick glue for joints or veneering. In all cases work it well into the wood in a similar manner to what painters do with paint. Glue both surfaces of your work, excepting in case of veneering. Never glue upon hot wood, or use hot cauls to veneer with, as the hot wood will absorb all the water in the glue too suddenly, and leave only a very little residue, with no adhesive power in it.

THE DAM AT SAN MATEO.—A remarkable dam is about to be constructed by a water company at the San Mateo Cañon, four miles from San Mateo, Cal., in order to form a reservoir. The cañon is very narrow and steep, and 15 feet below the bottom is a solid rock on which the foundation of the dam will rest. The structure will be 170 feet high, 175 feet wide at base, 20 feet at the top, and 700 feet in length. It will be the largest stone dam ever known to have been built. The dike will have a curvature of eighty feet, and the convex side will be upstream. The material will be a new sort of concrete composed of stones. The walls will be perfectly smooth. The reservoir that will be formed by it and the adjacent hills will be about eight miles in length and 150 feet deep in the deepest places. Its capacity will be about 32,000,000,000 gallons. The water will be conveyed by tunnels to the city of San Francisco.

PAINT on the walls of a kitchen is much better than kalsomine or whitewash. Any woman who can whitewash can paint her own kitchen. The wall needs first to be washed with soapsuds, then covered with a coat of dissolved glue; this must be allowed to dry thoroughly, and then covered with paint. A broad flat brush does the work quickly.

IN times now long past, flooring strips were supposed to be thoroughly seasoned before they were put down, but now the tree that stands in the forest to-day may form the floor that is laid a week or ten days hence.

WHEN cleaning a stove, if a small quantity of sugar is put into the stove blacking it will not burn off so quickly.

A PORTABLE SAW MILL.

THE above engraving represents a familiar scene to those who have watched the gradual clearing of our forests. In certain localities the timber, from a distance, looks like an immense forest, capable of yielding millions of feet of lumber; but, upon close inspection, the area is very limited that will furnish material for first-class lumber. Again, there are regions that seem to require just so much lumber. The portable mill shown in cut is especially adapted to just such places. Easily moved from place to place, and with a cutting capacity of many thousands of feet per day, the mill recommends itself to the consideration of those who are endeavoring to build up new towns. Full particulars can be obtained by addressing the J. I. Case Co., Racine, Wis.

The Essentials of Perspective.

A New Work, by L. W. MILLER.

THE aim of the book is to simplify and make real the basic laws underlying the draughtsman's art, in the hope that correct habits of thought and expression will aid in developing an art that will be symmetrical and harmonious, and not disfigured by the errors too often noticed in the work of our artists.

The point of view throughout is that of the artist rather than the merely scientific theorist, and the result is a thoroughly practical and simple text-book free from all unessential or theoretical discussion.

The style is clear, direct, and practical, and its instructions are happily supplemented by the numerous drawings which the author informs us "are the same that he has used for many years in teaching perspective from the blackboard." They therefore have the merit of practically illustrating the fundamental principles of the science, and are purposely made free from burdensome details in order that the applications made may be apparent at a glance.

PRICE, $1.50.

We will send a copy, post-paid, to any address upon receipt of the publisher's price, one dollar and fifty cents.

Agreeable Colors.

THE most agreeable colors are those difficult to name which seem to tremble on the verge of another color. Both white and black are, in nearly every case, enriched and improvised by judicious tempering with other colors. Thus white will be improved with a dash of yellow or red for warmth, blue or green for coldness, so that a green tinted white will look best in a pattern where there is much Indian red, and a pinky white may be opposed to much blue or gray. Black is always improved by the addition of a little blue, in which we follow nature, who rarely employs black unmixed with other color. Black is, after all, a relative color, requiring contrast to advantageously set it off. Under certain circumstances, where it would have a harsh or unpleasant effect, burnt umber may be made to stand for it. It is noticeable that emerald green, so beautiful in itself, regarded as a color, is terribly self-assertive.—*Painters' Magazine.*

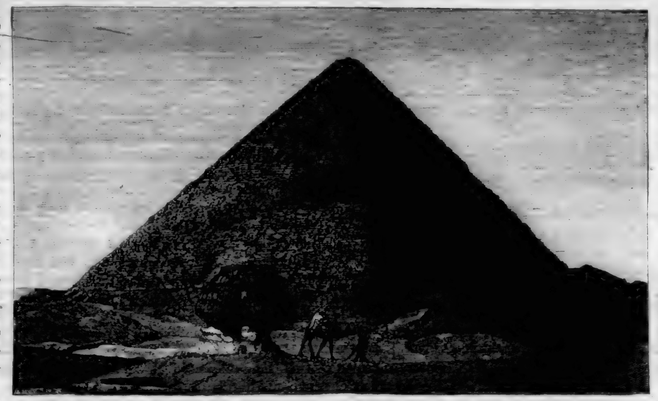
The Pyramids of Ghizeh.

UPON the western banks of the Nile, within a few miles of the renowned city of Cairo, are to be seen the wonderful tombs of Egyptian kings, the pyramids.

Although there are many such structures scattered over the sands of the desert, the three pyramids at Ghizeh command our attention as the most remarkable evidence of mechanical skill and constructive genius of all ancient works. The largest pyramid, as shown by our illustration, stands upon the rock plateau of the Nile, a few hundred feet from its banks, and is the grandest edifice—if it may be so termed—ever erected under the Egyptian monarchs.

The largest, or the Pyramid of Cheops, was 480 feet high, and its base is a square measuring 764 feet, and covers an area of about thirteen acres. It is constructed of an almost solid pile of stone masonry, consisting of about two hundred courses, each gradually receding back of the other until the top is reached, which originally was a point, but is now a platform thirty-two feet square.

It is believed that these pyramids were covered with an outer casing of stone or marble. The great pyramid, however, was covered with syenite, red granite, brought from a quarry situated near Syene, nearly 500 miles from Ghizeh. Many remains of this ancient covering are to be found at the base of this pyramid, while a portion of it still remains in place. The theory that these stupendous structures were erected for the purpose of kingly tombs, is evinced from the fact that part way up the side upon the north face is to be found a small opening, that originally was sealed up and covered over, probably for ages. Connecting this entrance were long, narrow passages, terminating in small sepulchral chambers, that originally contained the mummy case of the dead. These have long since been removed by relic hunters and explorers.



Pyramid of Cheops and the Sphinx, Remarkable as a Work of Masonry and Sculpture.

The four faces, or sides, of the pyramids are directed to the four cardinal points of the compass, proving that the ancients were acquainted with the laws that govern modern science.

One of the wonderful features of these grand structures, from a mechanical point of view, is the large size of some of the stones used. They gradually vary from the largest at the bottom, from six feet square by sixteen feet long, to three feet by eight feet, the platform at the top being formed of nine large stones, each weighing a ton. When we contemplate the complicated machinery required to raise these blocks to a height of five hundred feet, we are nonplussed; but when we realize that many of these massive blocks, weighing from ten to thirty tons, were brought from four to five hundred miles, we are amazed at the resource, genius, and constructive ability of that singular and remarkable race of people, the ancient Egyptians.

THE SPHINX—THE GIGANTIC MONUMENT OF ANTIQUITY—A REMINISCENCE OF EGYPT.

A few years ago the editor of this journal terminated a long and interesting tour of Egypt at Cairo, within the shadow of the prehistoric pyramids, and surrounded by the mighty relics of the Egyptian dynasties. Standing on the banks of the historical Nile, and looking out upon that almost unknown sea, the great desert, whose rolling sands have for ages buried many gigantic works of the ancients, our attention is arrested by those huge piles of masonry, which serve as tombs for numberless dead, and which we have learned to call the Pyramids of Ghizeh. Within three hundred paces of these colossal ruins stands the most striking object to be found in Egypt.

As if keeping sentinel over the downfall of a mighty people, guarding the sacred relics from the hand of the modern vandal, the Sphinx, that colossus of monolithic structures, raises its head above the ever-drifting, restless sands. Its face turned toward the east—staring into vacancy and the events of centuries—gigantic, majestic, awe-inspiring, it has witnessed the flight of time for nearly seven thousand years, witnessed the birth and fall of dynasties, the rise and decline of empires, the origin and destiny of Republics.

The archæologist, who wanders amongst the ruins of ancient Egypt, soon learns that upon that ancient highway, the Nile, are to be found the stupendous and gigantic structures that seem to have exhausted all human resources and rules of mechanics; the lofty walls and monolithic columns of Carnak and Luxor, the colossal statues of Memnon and Rameses, the Caryatidic Temple of Ipsambool, all strike the beholder with a profound awe and reverence, not only for the mighty works themselves, but the resources and deeds of a powerful and potent people.

The Sphinx, in comparison with the great stone structures of Egypt, stands pre-eminently the grandest work of time. Of an uncertain era, yet belonging to prehistoric ages, its workmanship bears witness to a period of educated art that even the lapse of ages, and the hand of time, have not obliterated.

It has generally been supposed that the Sphinx was a stone image entire, partaking of the head and shoulders of a man, and the breast and body of an animal, as many of the Sphinxes of Thebes and Carnak were formed, but recent excavations have dispelled the idea. It was demonstrated by Caviglia, in 1816, that the Sphinx of Ghizeh was shaped from a spur of solid rock, and that instead of being a body formed from the rock itself, it is little more than a gigantic head, 172 feet long and 56 feet high. The length is derived from what would seem to be the rear end of the spur or rock to the nose. The height is from the neck to the top of the head.

The rock in front of the figure or breast was removed by the ancient builders to a depth of fifty feet below the neck, or level of the sand on the pyramidal plateau, near which the Sphinx stands.

Caviglia found, upon removing the sand which had for ages accumulated about the breast of the figure, that two thousand three hundred years ago there existed a small nave or temple, built in front of the breast. This chapel was formed of three tablets, dedicated by the Egyptian monarchs, Thothenes III. and Rameses II., to their deity, the sun, of which the Sphinx was the emblem. These tablets formed the three sides of the temple, the fourth being composed of doors, on either side of which were recumbent lions, as if guarding the entrance. Opposite the doorway was placed a miniature altar, supported between the forepaws of a lion. This is believed to be of Roman origin. In 1869 another effort was made to excavate the statue that had become buried to the neck by the ever-drifting sand, when it was found that surrounding the Sphinx, nearly circular in form, was a flight of stone steps descending from the surrounding plateau to the temple before spoken of, and it is now believed that the statue stands in the midst of a circular basin of stone, hollowed out of the solid rock, and that the Sphinx was left in the center, while the surrounding rock was excavated. The rock from which the figure is cut is the common granite to be found on the Nile, and from which much of the work is constructed that lines the banks.

Upon examination it will be found that the Sphinx has been repaired by the introduction of blocks of red syenite or granite, but this work is generally supposed to be of Roman origin. Much of the stone used for this purpose seems to have been

Design for a Suburban Residence to be Built of Stone.

brought from the neighboring temple of Khafra, which was constructed of red syenite.

We note that at present renewed efforts are being made under the supervision of Messrs. Maspero and Grebaut, the noted engineers, to excavate the figure. Already the level of the platform temple and steps has been reached, after a continued labor of fifteen months, and it is expected that the excavations will be so far continued that we shall know more of the origin and purpose of this gigantic sentinel of the desert.—*Hill's National Builder.*

Working Without Thinking.

THE practice is too common for the mechanic to work without thinking. Having learned a trade he goes through a daily routine, which is so familiar that he could almost do it with his eyes closed, or in the dark. The part he has to do probably has little or no variety in it, and he settles down to the conclusion that there is no avenue open to him for advancement. He works like an inanimate machine, which, when the power is on whirs away day in and day out, until it is worn out, and unfit for further duty.

The unthinking workman does not closely observe even his own field of operation, and therefore never suggests any improvement in methods or material. A worker in woods, of this type, never stops to inquire from whence his supply of wood is obtained; when is the best time to cut timber, the better method of seasoning it, its extreme strength and durability; nothing is thought of beyond the mere fact that it is to be worked up into wheels, bodies, buildings, etc., as the case may be. Should anyone put the question to him covering either of the above, he would very likely give the curt reply that he had not time to bother his brains with such things, as they would be of no value to him.

The above model will serve for mechanics of every kind. It is a fact that some of the most valuable improvements have been thought out by men who worked at an entirely different branch from that to which the improvement pertained. In the carriage line the body-maker has invented a new kind of spring, axle, or something else. The blacksmith may have studied out an improvement on the sewing machine; the painter, a new tap and joints, and the trimmer has brought to light a patent priming or filler for woods. One's own trade seems to warp the mind, and from its monotony cause a lack of interest therein, beyond a desire to push it through and get done with it.

Now, if the skilled workman would take greater pride in his calling, and endeavor to master its every feature by long and arduous study, there would soon be wonderful advancement in the mechanic arts.—*Painters' Magazine.*

Harvey's Hot Water System of Heating.

THE difficulty of obtaining a uniform distribution of heat in buildings warmed by hot-air furnaces is well-known, and this difficulty has been met and overcome by an ingenious device consisting of a water-back in the furnace and water radiators in rooms remote from furnace where more heat is desired; this is produced by hot-water circulation, a very superior method of heating all kinds of buildings, especially dwelling-houses. The advantages in the use of this improvement in ordinary hot-air furnaces will be readily seen and appreciated by anyone familiar with furnace and hot-water heat. The hot-water circulation begins as soon as the furnace fire is started and the heat of the radiators increases and diminishes with the heat of the furnace and continues long after the furnace fire is out. Just here is where the economy comes in, and it is one of the principal advantages that this combination possesses over that of the combination hot-air and steam furnace where no heat is derived from radiators until steam is made, and should the fire become too low to make steam the radiators get cold.

The Bundy Hot-water Radiator, with vertical tubes and its upper and lower circulating chambers, is perhaps the most efficient, and is pronounced by those who have used it the quickest circulator on the market. It has been extensively used in Canada, England, and the United States for the past three years.

The cost of such an appliance is very moderate.

Its economy is unquestionable.

Its durability is the strongest argument favoring its use.

The comfort afforded and the advantages to health are of the most practical importance.

It is equally adapted to the *small cottage* or the largest residence.

In building a new house a large proportion of the expense of this system can be saved by discarding the extra chimneys and mantels, one chimney being sufficient.

It can readily be introduced into houses already occupied without damage to the walls, furniture, or carpets.

C. D. Harvey not only introduces the Bundy Radiator, but also the Harvey Hot-water Radiator and Furnace, to the attention of those who desire first-class methods of heating houses.

Mr. Harvey has been in this city over TEN YEARS and has introduced his system in over five hundred different houses. Upon application he will furnish a list of testimonials in accordance with the above.

Mr. Harvey can be found at 30 New Montgomery Street, corner Jessie. He has the largest stock, embracing all the latest improvements in the heating line, to be found west of the Mississippi Valley.

The Essentials of Perspective.

BY L. W. MILLER.

I WISH for a moment to consider the principles of perspective as applied to fixing the sizes of the objects represented. In the first place, let it be clearly understood that the only measurements which are of any consequence to the draughtsman are *relative* measurements. As far as the artist is concerned, he never thinks of any others; but architects and others who work from plans and elevations which are drawn to scale, do indeed use the actual measures, because in their case that is the most convenient way, but even then the actual measures become relative as fast as they are applied to the drawing, and these last are the only ones which appear in the result.

The term "drawing to scale," an expression constantly used in connection with the construction of geometrical plans and diagrams, has absolutely no significance when applied to a drawing in perspective. You may draw two or three lines in it by scale if you wish, but all the others will have to be measured by means of these; and even the first two or three may be put in just exactly as well without reference to any scale at all, and indeed much better, as far as producing a good effect is concerned. No one can tell in looking at a perspective drawing whether a building is twenty feet high or fifty feet, except by comparing it with some other object for which we carry a fairly accurate standard in our minds. Steps, for example, are of about the same height for all kinds of buildings and furnish a pretty good standard by which to measure other things; and lamp posts, gateways for foot-paths, etc., serve a similar purpose. The commonest and surest standard of heights is, however, the human figure. The horse answers pretty well, but you are not so sure of him. A pony may easily be mistaken for a horse, but a child will never be mistaken for a man if he has been drawn in any respectable fashion: and so the magnitudes of a picture become intelligible the moment the human figure is introduced.

Two kinds of measurements are employed in making pictures. The first enables us to determine the apparent size of an object with reference to some very obvious dimension—its height, for instance; the other relates to the foreshortening of objects, and to fixing distances between them, along lines which run to a vanishing point.

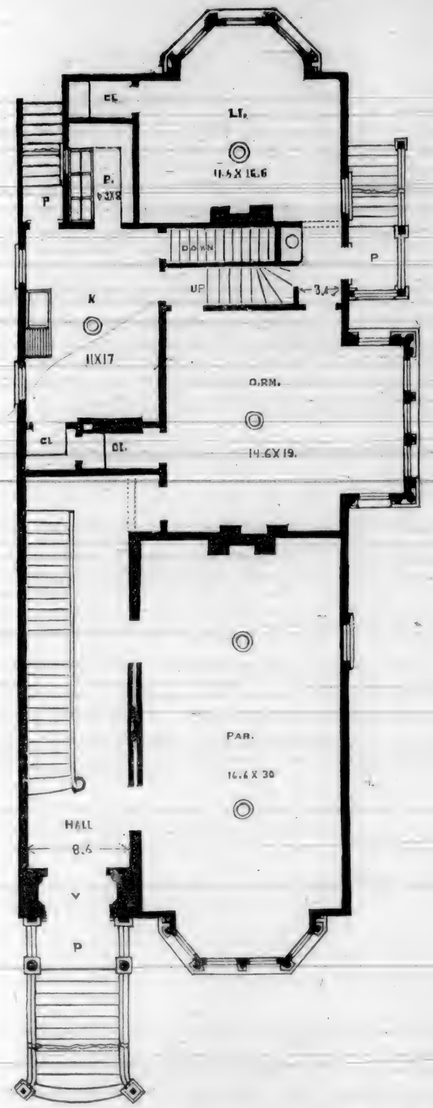
Look at the small engraving at top of page. It is quite a different, and a very much easier, matter to determine how high one driver's head ought to be, as compared with the other's, than it would be to measure the distance between the two. Now the length of the house might be compared with that of another one which was known to stand parallel with it—supposing such an one had appeared in the picture—by just such a process as that employed to determine the relative heights of the two men; but the width of the end of the house—which, as you see, faces the road—would have to be determined by the same method as that which would be employed to measure the distance between the carts.

The same is manifestly true of the spacing of the posts in the fence, or of the widths of the windows, and, generally, of all distances which one has occasion to measure along lines, which are said to "run into the picture," because they go to a vanishing point.

* * * * * * *

Measurements by Means of Triangles.

If the method of measuring by means of diagonals of squares is not applicable to every case that can possibly arise in the course of a draughtsman's practice, another and more general



statement of what really amounts to the same principle, will be found to be so; and as the greater includes the less, this other method might have been described in the first place, and all that has been said about diagonals omitted; if the method explained had not been not only simpler, and for that reason more convenient whenever it was applicable (and it almost always is, as artists use perspective) but being somewhat easier to understand, its discussion beforehand serves a very good purpose.

If in measuring the windows in a previous study it had also been necessary or desirable to determine the exact length of the house itself, the reader will see that we have not yet learned enough about perspective to do it; there is a way, however, of fixing such measures.

The width of each window and the length of the house itself in our large sketch shown were fixed in this way—at least they might have been so determined, if the drawing had been made to measure instead of being sketched on the spot.

The line to be measured is, in this case, the ground line of the front of the house. Let us measure its length first and attend to the windows afterwards. We have seen that any measures we may have occasion to use must be set off, if we are to be sure of them, on some line that is parallel to the picture plane, and that such a line is always parallel to the horizon of the plane in which it lies; that is, it is always parallel to the original or actual horizon when drawn on level surfaces and always vertical or upright when drawn on vertical surfaces, and so on. Our observations at the screen taught us that long ago. Such a line is drawn, then, in such a position as to have one point in common with the line to be measured. Theoretically, this may be wherever you please, but in practice it will usually be most convenient to draw this imaginary line through the nearest end of the line to be measured. As it is never used for any other purpose, it may be called the "line of measures."

The point which was called the vanishing point of diagonals in preceding figures, has been called the vanishing point of the base of the triangle in our large engraving (see the little diagram in the corner).

This name is a good one, because it does not allow the student to forget the real significance of the point, something which pupils find it very easy to do; but it is too long, and we shall have to call the point simply "measuring point"—only do not forget that it always *is* the vanishing point of the base of an isosceles triangle, otherwise it would not be of the slightest use as a measuring point. If your picture necessitates the establishing of many measurements, you have to regard it as in good part covered with pictures of isosceles triangles the bases of which all vanish at one or other of these points.

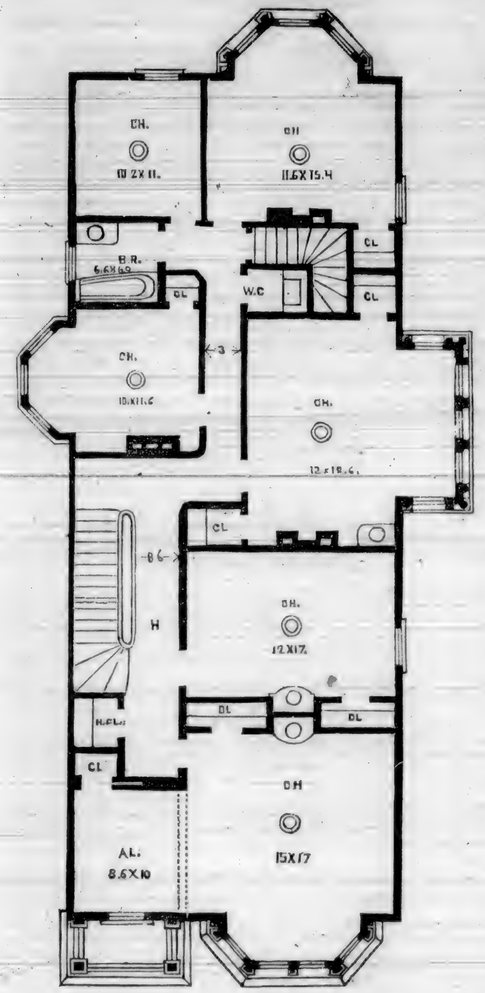
The above is taken from a new work (by publisher's permission) entitled, "The Essentials of Perspective." We have carefully read the book and can confidentially recommend the same to anyone desiring to become proficient in perspective drawing.

Boys as Inventors.

SOME of the most important inventions have been the work of mere boys. The invention of the valve motion to the steam engine was made by a boy. Watt left the engine in a very incomplete condition, from the fact that he had no way to open or close the valves, except by means of levers operated by the hand. He set up a large engine at one of the mines, and a boy was hired to work these valve levers. Although this was not hard work, yet it required his constant attention. As he was working these levers he saw that parts of the engine moved in the right direction, and at the exact time that he had to open or close the valves. He procured a long, strong cord, and made one end fasten to the proper part of the engine, and the other end to the valve lever. Then he had the perfect satisfaction of seeing the engine move off with regularity of motion. A short time after, the foreman came around and saw the boy playing marbles at the door. Looking at the engine he soon saw the ingenuity of the boy, and also the advantages of so great an invention. Mr. Watt then carried out the boy's inventive genius in a practical form, and made the steam engine a perfect automatic-working machine. The power loom is the invention of a farmer boy who had never seen or heard of such a thing. He cut one out with a knife, and after he had got it all done, he with great enthusiasm showed it to his father, who at once kicked it to pieces, saying that he would have no boy about him who would spend his time on such foolish things. The boy was afterward apprenticed to a blacksmith, and he soon found that his new master was kind and took a lively interest in him. He made a loom of what was left of the one his father had broken up, which he showed to his master. The blacksmith saw that he had no common boy for an apprentice, and that the invention was a very valuable one. He immediately had a loom constructed under the supervision of the boy. It worked to their perfect satisfaction, and so the blacksmith furnished the means to manufacture the looms, the boy to receive one-half the profits. In about a year the blacksmith wrote to the boy's father that he should visit him and bring with him a wealthy gentleman, who was the inventor of the celebrated power loom. You may be able to judge of the astonishment of the old man when his son was presented as the inventor, who told him the loom was the same as the model he (the father) had kicked to pieces but a year before.

Cyrus H. McCormick was not twenty-two years old when he produced the first practical reaper the world ever saw. Numerous other instances where boys produced valuable inventions might be cited.

IN building book-cases, there should be a half-inch space between the shelf and the wall—dust can then be easily brushed back, falling to the bottom.



Useful Hints Relating to House Building.

IN building a house for myself, to cost about $5,000, what are the special points which I must watch—points which may be overlooked by the architect or contractor, because, perhaps, not properly in their province, or because the owner should himself know them? I have never yet built a house, and am, in consequence, wholly inexperienced—an easy prey to imposition and mistakes.

The writer having had some experience in building houses as an owner, and paid somewhat dearly for it, proposes in this article to indicate some of the points desired.

In the first place, be most careful in the choice of your lot. Do not allow the cost per foot to be the most important element in your decision. A low-priced lot in the beginning may be the dearest in the end; that is, if it is chosen simply because it is low in price. Avail yourself as much as possible of the benefit of others' improvements. If there are desirable residences adjacent to the lot of your choice, the value of yours will be assured at the outset. Remember that you are about to put a certain sum of money upon whatever lot you select, and that a badly located lot will decrease the value of this; while, on the contrary, a good lot will enhance the value. Many have suffered disappointment, and actual loss, by an error of judgment in this regard. Your choice will make the difference between a good asset and a poor one.

Having chosen well to this point, see to it in the second place that the lot can be easily drained. To this end, it is not necessary that the ground should be high, but rather that it have a slope in some direction; otherwise, owing to the soakage into the ground of the surface water, which ought to run off, your cellar may be damp or wet at times. A dry cellar is of the utmost importance, and this is one of the ways to secure it.

Another point to be considered in your choice should be the exposure it would give your house. By this we mean the way it should front. A wise decision here will conduce greatly to the comfort and health of your family. The writer's experience is that the best frontage or facing for a house is a little west of south. This, more than any other, opens up the rooms to the sun in the winter and to the southwesterly breezes in the summer, thus making the house warm, healthy, and cheerful in the former, and cool and delightful in the latter, as the prevailing winds during the summer are from the southwest. At the same time, they carry away from the house the odors and heat of the kitchen; and during the winter the living part of the house is protected from the cold northerly blast.

A good size for the lot for a house to cost about $5,000 is 60x150 feet. If a stable in the rear is needed, the lot should not be less than 175 feet deep.

The next subject to be settled upon is the plan and specifications for such a house as your limit of cost will cover. This is a most difficult undertaking, and often ends in disappointment, usually because too much is expected for a given sum of money.

If style of interior and exterior is required, the size must be curtailed. If the rooms must be spacious and numerous, then the style and finish must be plain and unpretentious, both within and without. Of one thing be assured—everything cannot be obtained for $5,000 at the present cost of labor and materials.

This point fully understood, the writer has found that the quickest and best way to get the plan desired is to look at houses already built in the immediate or adjacent towns, which approximate to the cost named. Among the many which are now to be seen in all our suburban towns, there will be no difficulty in finding a house which will entirely satisfy the requirements. No mistake can then be made in the cost, for the builder himself is near at hand to duplicate for you, for a definite sum, the house you may select.

Disappointment in architectural effect will not happen, because you can see beforehand what an appearance the finished house will present.

It is better far to go to an architect with ideas well defined of what is wanted, and to ask of him to add to these his own taste and skill, than to go (as many do) with nothing settled in the mind but the cost, and to require of him to produce something entirely original in design and finish. His effort to fill such an order is generally a failure, not from any want of skill on his part, but rather because of his inability to grasp the intangible and indefinite ideas which may be in the mind of another. He must have some standard to work up to besides simply the cost.

If the architect succeeds in his effort as to the plan, you may consider you have made a fortunate beginning.

The specifications come next. As for these, let them be most carefully drawn, leaving nothing open, indefinitely or obscurely stated. Have them so drawn that they cover everything you want; otherwise you will have extras, which are always very costly.

It is a remarkable fact that anything taken from the specifications, after the contract has been signed, you can get no allowance for, but anything added to them greatly increases the cost. Why this should be so, only the contractor can tell you, and he generally will not. Hence, you must plan beforehand so as to avoid them, or, in the pithy words of the late Rev. Henry Ward Beecher, "First think out your work, and then work out your thoughts." This applies pre-eminently to building operations.—*Scientific American.*

THE AMERICAN CONTRACTOR

THE principal object of this publication is to furnish information, IN ADVANCE OF CONTRACTS, to architects, builders, contractors, and all those directly interested in furnishing materials of all kinds for buildings, bridges, plumbing work, machinery, and the thousand and one trades that are benefited by all kinds of building improvements. One great feature of this journal is the furnishing of special information to its yearly subscribers, having a special system of its own in this regard. It is published by B. Edwards, Chicago, and the subscription for the weekly edition is $5.00 per year. Subscriptions may be left at this office or sent direct to Mr. Edwards.

The Top of the Redwood Tree.

From time to time we have given engravings showing the stumps, thickness of bark, etc., of our great redwood trees. The above cut shows the top of one of our large trees and is a faithful representation of the average tree. No grander sight can be seen in nature than a grove of these magnificent trees, with their tops waving in the air at a height of—in cases—over four hundred feet.

ART SCHOOL—PAINTING—CRAYON.

Mr W. E. Rollins, formerly teacher of the drawing class in the art school, has opened a studio in the Washington Block, corner Montgomery Avenue and Washington Streets. We can cordially recommend this gentleman to those desiring to become proficient in either painting, or the skillful transferring of natural objects to the canvas by the use of the crayon. Mr. Rollins is a strict disciplinarian, and this feature is one of the most important necessary to a pupil's thorough advancement, as it enables him to become identified with the preceptor's ideas, and thereby in after years reproduce with a master hand the various objects in nature.

PICTURESQUE CALIFORNIA HOME, NO. 2. The great success attending the sale of the first volume, prompted the authors to issue the second one. The cuts in No. 2 are entirely new. Mailed to any address, either No. 1 or No. 2, for $3.50 each.

Master Plumbers' Association.

COUNTRY BUILDING INTELLIGENCE

In this and succeeding issues we intend to devote considerable space to information in connection with buildings, from every portion of the coast.

Only reliable news will be found in this column. Our custom has been for the past eight years, to furnish only data which could be relied upon. We will not publish rumors of "THIS AND THAT IS GOING ON" unless we are reasonably assured that such is truly the case. In all cases we will file our authority for any statements made in this column. No doubt mistakes will sometimes occur, but these we intend to be a rare exception to our rule of reliable news.

We desire the co-operation of country editors and mechanics to this department of this journal. By spreading the news of building engagement in your part of the country, you enhance the value of your section by proclaiming it a go-ahead community.

Architects should also notify us of "plans to figure on;" we do not charge anything for the insertion of such notices. Remember this journal is in the EIGHTH YEAR of its existence, and is the only journal published this side of the Rocky Mountains in the interest of Architects, Contractors, and Material Men.

Astoria.

Geo. Flavel will erect a brick building.

Album of Mantels, for $8.00.
Architects' Companion, for $2.50.

Burbank.

One and a half story frame cottage. Owner, W. H. Gancher; architects, Curlett, Eisen & Cuthbertson; contractor, E. Lane. Cost, $3,000.

LEFFELL'S HOUSE PLANS. $3.00, post-paid.

SCIENCE OF CARPENTRY MADE EASY. Price, $5.00.

MECHANIC'S GEOMETRY, or the Science of Framing by the use of Card-board Models. $5.00.

ARTISTIC TILES AND MANTELS.

ONE of the most artistic displays in Tiling, Mantels, Brass goods, etc., can be found in the rooms of E. A. Pattison & Co., 308 Stockton St., San Francisco. The design in tiling entitled "Cupid among the Roses," is worthy of particular mention. This firm is the sole Pacific Coast Agent for the Perth Amboy Terra Cotta Co. A large and well-selected line of wooden and iron mantels is kept constantly on hand, and the prices are such as to command the attention of those about building. The floors of Messrs. Pattison & Co's warerooms are covered with Tile and Parquette flooring of the most beautiful and artistic designs, and should be examined before purchases are made elsewhere. Special personal attention is given to furnishing designs and estimates for all work connected with the tasteful arrangement of everything connected with Mantels and Tiling. This firm also makes a specialty of stained glass. Write or call for information as per address mentioned.

Union Artificial Stone Paving Co.

THEO. VAN TASSELL is the manager of this newly-incorporated company. He is fully prepared to furnish all kinds of cement and artificial stone work. See new ad.

Labor Becoming Tyrannic.

PERSONS who watch the movements of various labor organizations of the present day cannot help seeing the evident tendency of those organizations to become monopolistic, to refuse freedom to others, to tyrannize over laborers in various disagreeable ways, and to attempt to acquire control of things not properly within their jurisdiction. For instance, not long ago there was a convention of glass-blowers at Atlantic City, New Jersey, and during the session a resolution was adopted abolishing the apprentice system in glass factories. The matter has, perhaps, small importance, but it is significant of the tendency of the labor movement, and it has an interest beyond the narrow boundaries of the glass industry, because similar action has already been taken by other trades. The point involved is this: Men who are earning their bread at skilled labor formally declare that no American boy shall be allowed to acquire the skill required to perform that labor. They turn their backs on the five or six million young men and boys in this country and deny them their right to become expert mechanics. The purpose, of course, is to make skilled labor scarce, and so to keep up wages. The result is to exclude the young from the chance to earn good wages, to force many of them into idleness, and to tempt others into crime. Against such a system the people of the country have a right to make vigorous protest. It is a matter that affects society at large. It touches directly every man who has children, and indirectly every human being from the lowest to the highest. The right of a boy to learn any honest trade that he desires to learn is positively indisputable; and to this is joined the clear right of every employer to take a boy into his shop to help him to acquire knowledge and skill. The denial of these rights by a trade union is tyranny, and it ought to be resisted to the last extremity. We assert that the solitary chance of the success of the labor movement, so called, lies in its obedience to the requirements of justice. When it sets justice at defiance, it is doomed. The people of this country are not going to permit any body of men to trample the most ordinary human rights under their feet.

On the same subject a Chicago journal says: "A father might to-day tramp all over Chicago with a son who wanted to learn an honest trade, so as to become a useful citizen, and fail, unless he took him to the Manual Training School and paid tuition for him. Hundreds of boys are now thus taught handicraft at the expense of fathers who can afford to pay for it. But let a poor man's son try it, and he will be met at the door of the factory or shop by a walking delegate of the Knights of Labor and turned away. If that does not do, his young face will be bruised by brutal fists, and so will the faces of those who stand by him. If anyone supposes that there is any limit to this kind of opposition, any point at which the would-be monopolists of labor would draw the line of limitation upon themselves, he does not understand depraved human nature. If individual liberty to acquire skill and earn bread and control earnings is not protected by law and by resolute public sentiment behind that law, then a reign of absolute lawlessness is visible not very distant in the future. The disbarred classes on one hand, and the employing classes on the other, will join hands and fight for their rights. The violence will not very long be all upon one side, and the violence which has human liberty and rights back of it will win. We are always glad to see a tyrannical and heartless employer forced to do right by "organized labor," but when organized labor determines to rob the American boy of his birthright, then it is evoking moral and material forces against itself which will not fail to beat it to pieces.—*Lumber World.*

Household Conveniences.

NOTHING astonishes an American abroad more than the backwardness of foreigners in adopting the little household conveniences which with us are matters almost of necessity. On the Continent, where people seem to live generally in the streets, and to have well-founded objections to staying in their houses any more than they can help, it is not so surprising that great pains should not be taken to render domestic life easy and convenient; but in England, the country, above all others, of beautiful and happy homes, one is often distressed to see the labor habitually expended upon work which in this country would be done almost automatically by some sort of ingenious appliance. We remember once going over the Belgravian mansion of Sir George Grey, ex-viceroy of India, and finding the kitchen in this aristocratic abode furnished with an enormous open fire-place, in which swung a crane, with pot-hooks and hangers, the whole, with the addition of a brick oven, forming the only cooking apparatus of the establishment; and every traveler can give plenty of illustrations of the discomforts of English houses. Even where American devices are transported across the water, they are received with suspicion, and are regarded as eccentric novelties for years after they have come into universal use with us. The last of these inventions to be introduced to the British public seems to be the well-known electric gas-lighting apparatus. Few houses, even of very modest pretensions, would now be built in or near any of our Northern cities without this indispensable feature; but it appears to gain ground very slowly in England. The *Builder* says, rather doubtfully, after describing the system by which the gas can either be turned on, lighted, or turned off by pushing a button, with the automatic burner, or turned on by hand and lighted by a pull at a pendant chain, that the apparatus appears to it "rather a pleasing toy than a serious convenience;" going on to explain that "it is hardly worth while to have a special electric mechanism merely to light the gas." This sounds very funny to people who never think of using matches or tapers to light the gas in their houses, and who would not on any account go back to that old-fashioned and dangerous practice. Even if the *Builder* thinks it of no advantage to be able to light the gas in the room by pulling a chain, or touching a button, instead of feeling in the dark on the mantel for the match-box, at the peril of upsetting the bric-a-brac behind which it lies concealed, and then succeeding in reaching the key, and turning on the gas just in time to have the red-hot remnant of the match drop into one's sleeve, while the gas, unlighted, pours into the room, it must, we should imagine, acknowledge that there is practical utility in an apparatus by which the gas in any room can be lighted from any other. In thousands of American houses the entrance-halls and vestibules are now lighted by the touch of a button in the rooms above, so that a ring at night, or an unusual noise below stairs, is immediately answered by lighting up the rooms, as a preliminary to a descent to see what is the matter; while in hundreds more the lanterns in the carriage, porch, or along the driveway are lighted and extinguished from the house in the same manner. With us the use of this simple and effective system is rapidly extending. We know a house where not only the gas-lights, but the fires are kindled and extinguished by the touch of a button; and the best of all systems of burglar alarm is that under which the house-breaker, on crawling through the basement windows, instead of frightening the family out of their wits by sounding a bell and displaying a sign in the bedrooms to the effect that ferocious criminals have arrived in the kitchen, sets in motion an apparatus which begins by suddenly illuminating with great brilliancy the place in which he had intended to do his deeds of darkness, at the same time deafening him by ringing an immense gong close to his head until the attention of the police is attracted to the place; the whole of the little drama going on without interrupting the slumbers of the unconscious master of the house in his room above.—*American Architect and Building News.*

LATH OR LATHS?—Lath or laths is the question. Most of the newspapers print it in the plural. At the East it is commonly called laths. In the West one scarcely ever hears a lumberman talking about laths; simple lath in a collective sense is good enough for the wild and untutored Western merchant. Webster's dictionary says that laths is right, and that is sufficient for the Eastern lumbermen who have graduated from college or high school to the lumber yard. Webster has doubtless decided that if it is right to say boards, pickets, and shingles, it is the proper thing to say laths. By the same rule corn should be corns, because beans are beans, and trout should be trouts. Words are as usage makes them. The *Lumberman* says lath, thus taking the liberty to disagree from the dictionary, choosing rather to conform to common sense and side with the great mass of men who handle the stuff.

"OAK is the grand, everlasting wood of the ages," quotes a lumber journal.

CARPENTRY MADE EASY.

By Wm. E. Bell, a practical mechanic, who fully appreciates, from personal experience, that there are many things perplexing to understand and difficult to do until they are fully explained and tested. It is designed to make the science and art of carpentry clear and comparatively easy to all who require information on the subject. Price, $5.00 by express, prepaid.

SAN FRANCISCO, CAL., AUGUST 15, 1887.

Improving the System.

THE building contracting business in San Francisco, and more or less throughout the State, within the past twenty-five years or more, in all the mechanical branches, has been conducted in a manner anything but satisfactory as a whole to architects, material men, or the responsible and better class of contractors. The true history of the business during the past quarter of a century presents a deplorable state of facts. Incompetent and irresponsible men, and withal men enjoying no fair degree of honest intent and purpose, have from time to time crowded in and operated as contractors, monopolizing a large proportion of the work offering, taking it at *taking* prices, with but little concern as to involvments, consequences, or results, thereby rendering it difficult and almost impossible for honest contractors to compete, and in thousands of cases ending in compromise, and, in short, *pro rata* settlements.

The effect of this has been sadly disastrous all around. The really competent and good men have been prevented from realizing what was and is their due—engagements at living prices, and fair compensation for the skill and service required of them in conducting and executing honest work. Material men have suffered severely by short payments, millions of dollars within the time named being lost through trusting men who had all to gain and nothing to lose by contracts undertaken at ruinous prices, and but for the fact that building materials, especially lumber, the chief commodity used in building construction in California, has always, except at special times when breaks in combinations and fierce competition for a period has "knocked the bottom out" of regular trade, paid, as it is now doing, large margins of profits, many of the dealers would have been forced to succumb under the severe losses which have at times followed in quick succession.

And while architects have not been involved in the direct losses growing out of this state of things, they have been severely contingent losers in time, annoyances, and vexations, as every engagement made with inferior contractors involves trouble and expense to the man of plans, who is expected to combat and counteract the short-comings of those under his supervision, and in the event of failure of any kind he is expected to be a Solomon, meeting the antagonizing views of everyone involved in the transaction, and satisfying the demands of all contending parties, or else meet the denunciations of those who may feel themselves aggrieved. While those who suffer more financially are greater losers in dollars and cents, the architect is by far the worst punished party concerned, in the misrepresentations and vexatious annoyances that attach to every case of failure by a contractor.

All this suggests, Who is most to blame? As a rule, those who lose place the *onus* upon the architect, who has, unfortunately to himself, yet innocently, allowed the contract to fall into improper hands. But a single second thought must bring the conviction that no sane or sensible architect would willingly permit himself to be the victim of such circumstances as generally follow engagements with men of known disrepute and dishonor. And when contractors present the credentials of ample credit, and their material men as bondsmen, it is not an easy matter for the architect to convince the owner that he should pass the lowest man, and pay from ten to twenty-five per cent more to the second or third higher bidder. Consequently, architects reply, and the majority of the better classes of contractors chime in, No; the fault lies in the fact that incompetent men are granted credit without regard to their financial or moral responsibility. The doors of trade are too easy upon their hinges, and the custom has been next to universal that any man, no matter what his actual pecuniary or moral status might be, could find all required credit and bonds necessary to enable him to claim his rights as a contractor, and undertake the work of construction, whether large or small.

But with the many-sided views existing in the issue, it is not likely that a unanimous agreement can possibly be reached as to who is most chargeable, nor is it now necessary, if all interested contractors, material men, and architects, will combine upon a plan that will serve every best interest, and substitute for the bad that has been, a condition of things that will be just to all concerned, and best alike for contractors, material men, architects, and owners, leaving the possibilities of failures and *pro ratas* in the future to extreme and incidental cases, averaging, at most, fairly within the limits of experience in the commercial world, and, we hope, far less.

But some will say, Have not owners profited by the state of things referred to? Yes, they have. But in reply, Have they not done just as all other men have done in other connections, availed themselves of the benefits appearing from this condition of affairs? It is a universal law among mankind to make the best bargain possible, and he who would refuse acceptance of a proposition purporting to lighten the drafts upon his exchequer, would not be estimated in the business world as sagacious and prudent, the results promised being the same. Hence to remedy the evils that have been in the building line, material men, contractors, and architects must advise the method, and by faithful, honest understanding carry into practice such rules and systems as will insure integrity and justice to all parties.

THE REMEDY IN HAND.

A movement is on foot among the material men, and others concerned in the risks and responsibilities of the building trades, which we hope will be worked to a successful issue, the object of which is to close the doors that have been open too wide, and bar them against the ingress of impecunious interlopers, by making reputation, competency, and responsibility a necessary password to credit. Let this be done and strictly adhered to, and it will not be long ere the skunk-weed class will disappear.

Building Summary for August.

THE past month has been a brisk one as far as building improvements are concerned. The number of improvements now under way is much greater than the same period of last year. Recapitulation for the month is as follows:—

105 frame buildings, value	$388,100
7 brick " "	150,000
24 alterations, value	44,250
136	$582,350
From Jan. to Aug. 15, 1886, 841 buildings, value	$4,528,735
" " " " " 1887, 744 " "	4,603,964

The indications are that in the remaining months of this year the discrepancy in *number* of buildings will be overcome, and this year show a larger number of improvements than 1886. The *value* is certainly greater.

San Francisco Chapter of Architects.

THE regular meeting was held the evening of the 5th inst., President Pissis presiding. After the reading and approval of minutes, reports of committees, and attention to general business, the nomination of officers for the ensuing year followed, the election to be held September 2. The committee reported favorably upon the application of Gingero Hamada as associate member. At this point a general discussion was indulged in, in regard to the past work of the Chapter, and its future prospects. An expression of abiding faith in its possibilities was unanimous, and the best of feelings permeated the evening's intercourse. The many material benefits to the profession, growing out of the Chapter's organization, were fully reviewed. The adoption by the Chapter of a schedule of charges for professional services, which is by our courts recognized as authority in cases of dispute, has been of great advantage to both members and non-members of the Chapter. But the more especial good done by the organization is found in its moral influence in bringing together a large portion of the membership of the profession, and establishing professional courtesies and friendly intercourse far greater than existed prior to the existence of the Chapter.

A more general, interested co-operation of the architects of San Francisco would doubtless add to the efficiency and influence of the Chapter. Among those who have assisted by service as officers and otherwise, and at convenient times or regularly attend the meetings of the Chapter, are Messrs. Wright, Sanders, Curlett, Laver, Pissis, Welsh, Clark, Moore, Wolfe, Henricksen, Bestor, Curtis, Gath, Macy, Bennett, Everett, Babson, Eisen, while many others in San Francisco, San Jose, Los Angeles, Oakland, Sacramento, and other places, hold inactive membership, and visits from non-members frequently occur.

While the Chapter may not have made that decidedly successful advance possible, and placed itself in the position for good that it might have done, its management has been free from individualism and clique influence. A generous and liberal sentiment and harmony of purpose have prevailed, and those who have been most earnest in the work have been actuated by best judgment and honest intent and purpose; so that whatever mistakes may have been made have been the result of error of judgment.

Those who have not affiliated are alone to blame for any seeming imperfection of the organization, as the doors of the Chapter have ever been open to every good man, and those who could have done better than seems to them to have been done by those who have done the best they knew how, are at fault in not assuming the position that has ever been free to them, and by the force and influence of their greater wisdom helping to found and perpetuate an architectural organization in San Francisco that would accomplish all that could be accomplished by a body of intelligent, practicing architects.

THE SEWAGE SYSTEM FOR SAN DIEGO, CAL.—The *Sanitary News* describes a somewhat novel plan for disposing of sewage in the system which Colonel Waring has engaged to build for San Diego, Cal., at a cost of about $400,000. The main sewer runs a quarter of a mile into the harbor to an outlet-reservoir constructed alongside the deep ship-channel. The reservoir will have an area of one acre, and cost some $50,000. The collected sewage will fill this reservoir not more than one and a half feet deep. High tide will add three and a half feet of sea water to the mass. The contents thus diluted will be discharged into the outgoing tide by automatic gates opening an hour after high tide, and closing an hour before low tide. At Stockton and Sacramento, where the conditions are nearly identical, Colonel Waring will make wells in various flat parts of the cities, connecting with a deep outlet well by large siphons. Colonel Waring has used this plan for two years successfully at Norfolk, Va. At Los Angeles he recommends the purchase of 10,000 acres of land six miles from the city, and the disposal of the sewage upon it by irrigation.

Artificial Stone Sidewalks.

THE superiority of well-laid artificial stone sidewalks is universally admitted, and as a rule everybody is having new sidewalks put down, and those who can afford the slight additional expense over wood, especially in front of new buildings, adopt the more durable, and practically more economical, device—artificial stone. There are numerous examples of excellent work of this kind in San Francisco, and some wretched abortions. When the number engaged in contracting this class of work was limited to those who both fully understood the art of manipulating cement, and who retained a feeling of pride in the quality of work done by them, a better class of work was produced. But its growing and rapidly increasing popularity offered inducements to many adventurers to become sidewalk contractors, until at the present time there is a host of them—some good workmen, having learned the trade by service under the earlier employers who introduced the business in this city, and as many more who possess not the first item of practical knowledge, except to make a few figures by way of ascertaining the number of square feet contained in the space to be covered, and ordering the required material. As to the proper way to manipulate the same they know nothing, and are forced to depend upon such hired help as they may control; consequently competition is large and zealous, and, as a result, prices low, with the *finale* of some miserably poor work.

Some men are actually contracting to put down artificial stone sidewalks in San Francisco for less than the first cost of the raw material alone, required in the execution of good work, with nothing allowed for labor. Many owners think this is nice, and imagine that they are doing a good thing for themselves by a deal of this kind, failing to realize the fact, as fact it is, that to do cheap work of this kind the cheapening is compensated to the worker, by the inferior quality or diminished quantity of cement used, and the economizing of labor. The outcome of all this is that some of the earlier laid sidewalks put down by the pioneer *cheap* men are, after a few years' wear, worn out or so badly distigured by cracks that they present very unsightly appearances, while many of the cheaply laid kind laid within the past year or two are in the line of their predecessors in kind, badly cracked.

It is all well enough to obtain the thing one wants as cheaply as possible, provided the thing actually wanted can be had for the cheap figure; but it is a little bit of humbuggery played on one's self to smile at a result which in reality gives the occasion to laugh to the party smiled at.

Most of the very cheaply laid sidewalks will prove "good for the trade," inasmuch as they will wear out in a few years, and require relaying, while those laid in first-class manner will endure for a generation.

Answer to "Draughtsmen Wanted."

SINCE the first appearance in this journal of the article with above heading, we have received scores of letters, asking information in regard to situations. So far, our time and postage stamps have been freely given to answer inquiries; but we must decline, in future, to answer letters that do not contain return postage. Our books will show that over one hundred letters have been answered, upon which, in addition to our own trouble, we have had to supply stamps in order that the letters may be received by applicants. We will gladly answer any letter sent us by those seeking information, but will only do so when proper postage is inclosed for return answer.

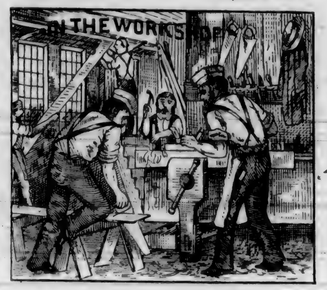
MORE DRAUGHTSMEN ARE WANTED.

From present appearances, the demand will be greater than ever. We can readily place from fifteen to twenty good draughtsmen at good wages and a long engagement. Please remember that *carpenter sketchmen* are not wanted. We can only place thorough draughtsmen, who can execute all the details necessary to every portion of a building.

PLUMBERS, as well as architects, will be interested in the account given in the *Deutsche Bauunternehmer* of a novel method for thawing the ground, as a preliminary to excavation in winter. Instead of building a fire over the spot to be excavated, as is with us the ordinary practice, those who use the new method spread over it a layer of quicklime, followed by a stratum of snow. More lime is put on, and this again covered with snow, and if the ground is frozen to a great depth, several alternate layers are used. The whole is then left to itself overnight, and in the morning the ground is found to be free from frost. If no snow is to be had, water may be used for slaking the lime, which is then to be covered up to keep in the heat.

ASKED, ANSWERED, and COMMUNICATED.

Architects, Contractors, Carpenters, and mechanics generally are respectfully requested to furnish us items of interest for this column. We will gladly answer any and all questions pertaining to the architectural and building interests. If illustrations are necessary to explain your ideas, send us a sketch of them, and we will make the cuts. We especially invite suggestions from apprentices and young mechanics.



Pitch of Roofs.

From M. O. F., Nevada City, Cal.—I have a dispute with a brother tinner with reference to the pitches of roofs. My argument is that the term one-half pitch, one-third pitch, etc., refers to the fractional parts of the ¼ circle—in other words, the fractional part of 90°. Therefore, one-half pitch would be an angle of 45°, and one-third pitch, 30°, and so on. The argument of my opponent in this controversy is that a roof that rises 12 in. in 12 in. run is full pitch, while a rise of 6 in. in 12 in. run is one-half pitch, simply because 6 is one-half of 12. By the same argument, a rise of 4 in. in 12 in. would be one-third pitch, because 4 is one-third of 12. Will you please explain this subject and greatly oblige?

Answer—The term pitch referring to the slope of the rafters of a roof, as used by architects and builders, is dependent upon both span and rise. Pitch is expressed in several different ways. Sometimes it is given in the degrees of angle which the rafter makes with the horizontal. This method, however, is not in common use outside of the books. The most general plan, however, of expressing pitch is by the height in parts of the span. Accordingly, it is quite common to hear a roof spoken of as one-half pitch or one-third pitch. If, for example, the span is 30 feet and the height is 10 feet, the pitch by this method is called "third pitch." Another plan, but not in such general use, is by the length of the rafters in parts of the span. Thus if the span is 30 feet and the length of the rafter 20 feet, by this method the pitch would be called "two-thirds pitch." It would seem from the statement made by our correspondent above that neither he nor his opponent in the controversy is correct. The latter is manifestly wrong, and he employs terms which have apparently been invented for his purpose. For example, notice the term "full" pitch. In describing his own explanation of these terms, our correspondent fails to indicate how the angle is to be measured, and we do not know that we quite understand what he means, although his description of the method is apparently plausible. What we have printed above is the recognized standard adopted by builders and architects in general. —*Carpentry and Building.*

PINE naturally treated is one thing; painted in brown or red and called black walnut, mahogany, or cherry, it is decidedly another. So in hard woods; to show the natural color and to bring out the beautiful grain of the wood is far preferable to any treatment which aims at different results.

Redwood Shingles.

From A. W. H., Westfield.—"I desire to refer one or two questions about California redwood shingles to the readers of *Carpentry and Building*. I have seen redwood shingles that when first put on the walls and oiled looked very well, but after a few days or weeks, however, dark-colored shingles began to appear among them, and accordingly the sides of the building looked very bad indeed. I desire to inquire if there is any way by which this difficulty can be overcome."

In answer to the above, it may be stated that, to insure equality and uniformity of color, redwood shingles intended for oiling should be selected. The texture of the California production varies greatly, some being fine-grained, light-colored, soft woods, and other trees producing hard and brash kinds, down to what is known as black-heart redwood; consequently the yield in shingles from the respective classes must vary greatly as to color under treatment. Before exposure to the weather, this difference is not so marked, nor even when used in ordinary roofs and painted, or the natural surface exposed to the weather. But it must be apparent that where soft, porous, and hard-grained, brashy shingles are laid indiscriminately in same connection, and oiled, the oil penetrates the one and disappears, and remains on the surface of the other, producing widely different results in a little while.

Again, sappy redwood shingles should never be used, as the sappy parts have no lasting quality anywhere, and if used in shingles and oiled, the sappy portions will speedily show contrast.

Be Saving and Buy a Lot.

EVERY young man who earns wages ought to buy a lot and make a start of a home. The way to get a start is to save a little money each month and make a payment on your purchase, and so, little by little, pay for a lot and build your house. Don't spend all your money on livery turn-outs and dances and ice-cream to please your best girl. After a while you will need a home for that best girl, and the youngsters that some way or another generally come around and want to "put up" with you. Put a little of your spare cash into the ground as you go along, and after many days it will bring you a royalty.

Glue Which Will Hold in Water.

POWDER and dissolve one part of glue in one of thick linseed oil varnish boiling hot, and mix thoroughly. In using it, heat the two planed sides of the wood, apply the glue warm, and press the pieces together.

To Clean Oil Paintings.

THE following recipe will be found valuable for the purpose: Mix well together two ounces of wood naphtha, one ounce spirits of salts, and a quarter of a pint of linseed oil. Before being used the bottle containing them should be shaken. The application is simply with a soft pad of linen, to which should be given a circular motion. When nearly dry give a second dressing, when the picture will come out in all its details.

Restoring Moulded Picture Frames.

SHOULD any portion of the moulding be destroyed, it may be restored by a composition made by boiling together some Venice turpentine, resin, and linseed oil, then adding glue dissolved in water, and, finally, whiting, till the mass is brought to the consistency of putty. The composition is then shaped to supply the defective part, and is to be colored or gilded to match the rest of frame.

A DOWN-EAST Yankee has invented a new screw—half nail, half screw—which is said to beat anything extant. Two blows of the hammer, two turns of the screw-driver, and it is in. Its holding power in white pine is said to be 332 pounds, against 298 pounds, the holding power of the present screw.

PLASTER when dry, treated with two coats of warm boiled oil, will, when painted, stand the elements as well as wood. Rogers' statuary is made in this manner. Shellac varnish is used sometimes in place of boiled oil, but if there is any common lime in the work it is apt to scale.

TO BE AVOIDED.—Resin is frequently used for producing an immediate adhesion of the belt to the pulley, and for this it is well suited, but if the owner has any regard for the consequences, he will soon learn that while the resin will give an instant grip to the slipping belt, it will soon be ground into the leather, stiffen the material and make the last state of that belt worse than its first.

NOT MUCH NEED OF IT.—There is not so much need of sandpaper in the manufacture of furniture and all cabinet work now adays, as the machinery used turns out very perfect work. It is estimated by one of the largest manufacturers of sandpaper in the country that not more than seventy per cent of the amount of last year's business will be done this year.

THE salt industry at Manistee and Ludington, Michigan, has greatly curtailed the lath business. Edgings alone are now cut into lath, as slabs are more valuable for salt-barrel staves.

Constitution of the Builders' Association of California.

ARTICLE I.

Section 1. This Association shall be known as The Builders' Association of California.

Sec. 2. Its object shall be to encourage a more intimate acquaintance and cultivate a feeling of friendship among its members; to make them better acquainted with the wants and necessities of the building business; to arbitrate and settle disputes, if any arise among the members, and generally to advance and protect their business interests as contracting builders.

ARTICLE II.

Section 1. Any carpenter residing and doing business as a general contractor and builder in the State of California, and who has announced his willingness to join this Association prior to the adoption of this Constitution, shall be eligible to membership herein without vote, upon the payment of the fee, as provided in this Constitution and the By-Laws.

Sec. 2. Any carpenter residing and doing business as aforesaid may become a member, upon being proposed by two members and receiving the affirmative vote of two-thirds of the members present at a regular meeting, and paying the fee as prescribed in the By-Laws.

ARTICLE III.

Section 1. The regular meetings shall be held at least once a month upon the day and hour fixed in the By Laws and in the City of San Francisco.

Sec. 2. Special meetings may be called by the President (and in his absence by the Vice-President) at his discretion, and shall be called by him at the written request of the Executive Committee or of five other members.
